THE SHEPHERD.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 1.] SATURDAY, AUGUST 30, 1834.

[Price 1d.]

THE good shepherd leadeth his sheep to the richest pastures and to the springs of pure water. He giveth alarm when the wolf cometh, and taketh care that no deadly thing should ever hurt them. He seeketh out the food that is convenient for them. We shall endeavour to follow his example, whilst we lead the minds of our little flock over the whole surface of the pasturage of nature.

But, first of all, we shall take them up into the very heights of science, and give them one general bird's-eye prospect of the whole contents of the material world. The view is simple and intelligible to the humblest mind. It is not perplexed with the detail of mathematical demonstrations and calculations, nor the metaphysical jargon of scholastic sages, in the intricacies of whose ravelled path the shrewdest and most courageous mind is infinitely bewildered with the multiplicity of objects which demand its attention. Yet it is indispensable to all parties, inasmuch as it lays a foundation for correct reasoning upon every subject.

Nature is our splendid unity—connected in all its parts—and though apparently at times in violent opposition to itself, yet this opposition is only local, and always ends in the restoration of tranquillity. If not, nature would ultimately destroy itself, which is impossible. Hence it follows that nature, as a whole, is in harmony with itself, and harmony is good. It follows, also, that no evil can last for ever—evil destroys itself—good only is external, and naturally arises into being after evil has exhausted itself. Thus the balance swings for a long time after the scales are filled, and then reposes in equilibrium and justice for ever.

Nature is also infinite; she has no beginning—can have no end—and no boundary of existence. Nay, we may almost venture to say that the stars are infinite in number—for, if not, there would be an infinity of space beyond them in which nothing existed, and those at the very border of creation would be attracted by those in the centre, and all would converge into one mass—unless we suppose them, like the planets, to whirl around one common centre.

Nature consists of three distinct varieties of matter—solids, liquids, and gases; and these three are composed of the same ingredients. Thus the solid ice is convertible into liquid water, and liquid water into gaseous steam—steam and ice, then, are the same in substance. Water is composed of two gases, and these two gases can easily be separated—the one is hydrogen, the lightest substance known, and employed by aeronauts for the inflation of balloons—the other is oxygen, the gas which creates com-

bustion and heat. It is very singular that the combination of these two gases also creates light and heat; the flame of a candle or a furnace is nothing but the union of hydrogen and oxygen—yet the same hydrogen and oxygen, mingled in different proportions, create water, which extinguishes the fire! In certain proportions they become what is called *fixed*, that is, almost inseparable, and create a distinct substance—in some they are at rest, in others in violent motion, and these varieties of quantity and action produce an infinite variety of substances.

But the gases alone never can create what we call earth—hence the necessity of a more solid substance, which chemists call carbon. This, united to the gases above-mentioned, produces every variety of solid matter. In the chemical analyses of vegetables you will find everlastingly these three substances, oxygen, hydrogen, and carbon, to constitute the ingredients—each variety possessing its own proportions.

As yet we have not spoken of nitrogen gas, lest we should destroy the simplicity of the general outline. Nitrogen is a gas, which, combined with oxygen, creates the air which we breathe. One part of oxygen and three and a half of nitrogen make atmospheric air. Here, then, is a fourth substance, and we can find a thousand others; but the query is, is it a simple substance, or a fixed compound? The latter is now pretty generally believed to be the case amongst the chemists, although they have not been able to analyze it. Neither have they been able to analyze many other substances, which on that account they are obliged to regard as simple substances, until they succeed in discovering their component parts. But in every substance which they have analyzed, they invariably find two or more of the original elements, oxygen, hydrogen, and carbon; and in the case of vegetables and animals, all the three. But other substances are only found occasionally, and therefore are justly regarded as not elementary substances of nature, but fixed compounds of the three elements, whose proportions are yet to be discovered. Nitrogen is said to form the distinction between vegetables and animals, being found in the latter, and almost never in the former. How it comes into the animal has puzzled the chemists considerably, for although it exists in the atmosphere, it is to be found in the chyle, or digested food of the stomach, before it can have any connexion with the atmosphere, from which it appears that it is formed of a new combination of the elements of vegetation in the stomach; and those animals which feed upon animal food have not more nitrogen in their fluids than those which live on vegetable

food. Sir B. Harwood was in the habit of emptying the veins of a dog, and filling them again with sheep's blood. The dogs were quite happy and healthy in their new friendship.

Having given a general outline of nature's component parts, we shall now say a few words on the action and reaction of these parts upon each other:—Carbon may be called the body of nature, and oxygen and hydrogen its two spirits. These two spirits have each a distinct character—the one may be called active, the other passive, or, if you will, male and female. They have a great affinity for each other. This affinity is the cause of all the movements of nature. Hydrogen is the most delicate, and is exceedingly combustible; but it cannot burn without oxygen. The lightning of the thunder-storm is nothing but the union of two separate beds of these gases into one; hence the rain that follows, for the same two elements that constitute fire make water also. Oxygen is the active, and hydrogen the passive, that is, comparatively speaking, and carbon the passive inheritor of both.

Of the three substances, solid, liquid, and gas, the solid is in one sense the strongest, and in another the weakest—the gas is the weakest and yet the strongest. What is more powerful than the lightning? What is more inert than a mountain? It is the gas which causes the earth to shake, and rends the mountain into fragments. The gas acquires this power by its elasticity and motion. All active power resides in gas—the solid has only the passive power of resistance. Fill a hollow iron ball with water, and hermetically seal it, and throw it into a furnace: the water will be converted into gas by the heat, and the gas will press with vehemence on the sides of the ball. The iron will exert its passive power of resistance for a considerable time, but at last the gas will prevail—burst the ball with a tremendous explosion, and carry the walls of the furnace along with it. Thus the weakest is the strongest, and the strongest the weakest, and strength is made perfect by weakness. Let no man therefore despise the weakness of nature, for therein its strength lies—and this beautiful truth displays itself in every department of nature. Thus, for instance, in our own species, the man of mild and amiable deportment, and moderate abilities, will successfully accomplish his end, when the man of loud and presumptuous pretensions, obstinacy of disposition, and strength of mind, will meet with humiliation and disappointment. Metaphysics may be learned from physics, and physics from metaphysics; for such is the harmony of nature, that if a law be found prevalent in the one, you may be sure to find its counterpart and equivalent in the other.

There is another division of nature, which respects organization; namely, the mineral, vegetable, and animal—or death, vegetation, and life. The first is the source from which the other two derive their being. Vegetation derives all its nourishment from the mineral world, from which it extracts loose carbon and water. Animals derive all their nourishment from vegetation—the process of vegetation being previously necessary, before the carbon and water can be so modified as to serve for food.

Thus life rises out of death—and that which appears in its first stage to have no perception, becomes endowed with sensation and reflection. But when we say that the mineral world has no sensation, we affirm what we know not, and what experience teaches not—we are like the fly on the pillar of a Grecian temple, whose minute eye perceived only the imperfections of a small part of the surface, without being able to comprehend the whole. It deplored the depravity of human taste, and railed against the clumsiness and deformity of the shaft, whilst two connoisseurs in architecture were admiring the polish of the surface and the beauty of the design. What we know, or pretend to know, of the mineral world, we know only in part. Of its omnipresent compounds, oxygen, hydrogen, and carbon, and the power that moves them, we know nothing—but we know that all our own movements are the result of will; and experience makes us acquainted with no other motion. There is no death in nature—that which we call death is the most active of all—death cannot move.

Vegetables, we have said, extract from the soil loose carbon and water, which constitute the food that rears them—hence the necessity of ploughing, and breaking, and softening the soil, in order to give them nourishment—and as they themselves are composed of carbon and water, they become when decayed the very best soil for the nourishment of others. Thus it necessarily follows that the soil must become richer and richer every season—for vegetation is a chemical process, which creates new soil for the continuation of its species. One field may be exhausted by heavy crops, and no remuneration—but some other field is enriched at its expense. The soil, as a whole, must improve; and under proper management the whole world may become a rich garden, improving in beauty, in fertility, and salubrity, for ever. Thus the prophetic hopes of all ages, and all nations, shall be realized—"the earth become a watered garden, the wilderness and the solitary place look glad, and the desert rejoice and blossom as the rose. Instead of the thorn shall come up the fir-tree, and instead of the brier shall come up the myrtle-tree—the mountains shall drop with wine, and the hills flow with milk."

THE SHEPHERD.

FEASTING EXTRAVAGANCE, &c.

LIONEL of Clarenti gave an entertainment at his marriage, at which there were thirty-six courses: from the fragments of which one thousand persons were fed. The matrimonial feast of Edward the Third cost 40,000*l.*—an enormous sum in those days. Ralph, Abbot of St. Augustine, exceeded that sum by 3,000*l.* at his installation feast. In those days the clergy were the richest princes in Europe. The cardinals and bishops had frequently in their retinue a hundred and fifty or two hundred servants. We read of barons having thirty thousand dishes at their wedding tables; of monks complaining against the abbots for depriving them of three out of the 13 dishes they were accustomed to have at each meal; of other monks enjoying seventeen dishes constantly, all of which were dressed with spices and rich sauces: yet these monks had taken the vow of poverty and self-mortification! of 400*l.* being paid for almond-

milk for the use of these self-mortifying friars on the fish-days; and of an archbishop (Neville) who had, among other dainties, one thousand of those beautiful birds of the heron kind, called egrettes, served at his table at once; since which time they are become so scarce in the country, that he may be said to have devoured the species at one meal. One of the Roman emperors, fond of rarities of an expensive nature, is said to have devoured two hundred ostrich brains to his supper. Heliogabalus used always to feed at the most expensive rate—he ate fish when he was at a distance from the coast; and when he was on the coast, he must have game brought from the farthest inland. Anthony and Cleopatra, trying to outdo each other in extravagance, she reduced to powder one of the richest jewels in the world, and swallowed it at once. This reminds us of a celebrated old eccentric gentleman of great wealth in Glasgow, whose name is still familiar to the ears of the inhabitants. He went by the name of Bob Dragon, and his house where he shot himself was said by the credulous to be haunted for many years after. Bob and another person betted one hundred guineas that each would eat the most expensive meal; Bob's rival, however, had not wit enough; he had not read the story of Anthony and Cleopatra—he dealt fairly with Bob, and loaded his stomach with the rarest dainties. Bob merely took a slice of bread and butter, and laid a fifty-pound note upon it, which he devoured in a twinkling, with an air of triumph. He gained fifty pounds by the loss. A favourite preacher of France, to excessive epicurism superadded the impudence of reading aloud from the pulpit a petition from the pheasants, partridges, and ortolans, "that the clergy alone would eat them, so that being incorporated with their glorious bodies, they might be raised to heaven, and not go down with infamous devourers to the infernal regions." It does not appear that the infamous devourers amongst the laity ever took the hint. Such is a specimen of what man has been under a system of monopoly and inequality; and it is only the progress of liberalism, and the moral power of public intelligence, that is gradually destroying the evil, and which can ultimately extort from the rich an acknowledgment of the rights of the poor.

NUTRITION.

Valuable as the discoveries of the chemist may be, and demonstrative as the results of his experiments really are, still there is a vast deal of theory and conjecture in the science, arising from the imperfection of his knowledge. Theory, however, always precedes truth. If men were never to theorize, they would never make discoveries; the progress of science would be at a stand, and men would probably degenerate into illiterate barbarians. If theory, therefore, be an evil, it is not only necessary, but an extremely useful evil; an evil which stimulates the mind to exertion, and suggests that infinite variety of experiments, in the making of which the assiduous theorist discovers new properties of matter, and new laws and modes of nature's action. Upon the subject of nutrition much has been said and written, but little as yet that is conclusive and satisfactory. One chemist will dogmatically tell you that this species of food possesses more nourishment than that, and moreover will tell you the exact proportions. Another differs decidedly from his learned brother, gives a totally different verdict, and

different proportions. The cause of this discrepancy is that they have not previously ascertained what nutrition is—what those substances are which afford nourishment to the human body. Gluten and starch are accounted nutritious amongst the vegetable productions, and gelatine is accounted the most nutritious of all, on account of its superior strength. In ascertaining, therefore, the comparative nutriment contained in any species of food, it is usual merely to determine the quantity of starch, or gluten, or albumen, or gelatine, &c., and water, of course, with its various compounds, is regarded as nothing. This is a very deceptive process of reasoning, if reasoning it deserves to be called, for it must be evident enough that nourishment is not derived from solid matter merely, but from liquid also. The proportion of liquid to solid has been differently estimated. Sanctorius rated it as ten to three, Cheyne as two to one, and Cornaro took only fourteen ounces of drink to twelve ounces of solid matter. According to the first, potatoes, which are three-fourths water, contain pretty nearly the requisite proportion of solid and fluid; and a dinner of potatoes and salt would consequently require not a drop of water or any other liquid to wash it down, since it already contains somewhat more than enough of the watery element; and according to the two latter it would be quite preposterous to drink with potatoes, but rather to *stuff 'em* down with dry flour or crust, the easiest way we could. Such theories as these are not for practice. Neither are we to determine the nourishing properties of any species of food by the quantity of glutinous or gelatinous matter it contains, for nourishment does not depend upon one substance or another, but upon suitable combinations of different substances; which combinations depend in a great measure for their virtues on the constitution which receives them. "What is one man's meat is another man's poison," is a stale, but yet a true proverb, confirmed by the experience of all ages, and not to be overturned by the ingenious sophisms of philosophical theorists. Much depends on the state of the mind and the nervous system. During high excitement either of joy or grief, the stomach loses its power of digesting, and even of receiving or retaining food. In cold weather its power is greater than in hot, in activity than in idleness; and consequently the food must vary according to the prevailing humour of the laboratory in which it is decomposed. Some men will fatten on bread and water, others are as lean as scarecrows in spite of all the gelatine, gluten, and generous liqueurs, which wealth and cooking can supply.

As a specimen of the uncertainty of chemical analysis on such subjects, take the following estimates of the comparative virtues of potatoes and wheat. According to Mayer the proportion is as 13 to 48, according to Black, as 15 to 120; to Petri as 15 to 74, and according to the experiments of the faculty of medicine in Paris, as 15 to 45.

Raspail has suggested that possibly nutrition may be the result of an acid fermentation, in which case a substance may be nutritive or not, according as it is or is not associated with another substance, which is necessary to fermentation; that, for instance, a substance rich in sugar, but containing little gluten, may cease to be nutritious in consequence of the exhaustion of its gluten, if it is not associated with another that is highly glutinous.

GEOLOGICAL.

At the Delta of the Rhone, where the river enters the Lake of Geneva or Lemman, the soil is accumulating so rapidly that Port Vallais (Portus Valesiæ of the Romans), once at the water's edge, is now more than a mile and a half inland; so that, in process of time, the lake may be filled, and present nothing but a fine rich plain, with many fossils of fish and land animals, washed down by inundations, &c. Where the Rhone enters the Mediterranean, similar changes have taken place. Mese, called nearly an island by Pomponius Mela, is now far inland. *Notre Dame des Ports*, a harbour in 898, is now three miles from sea. Psalmodi was an island in 815, and is now two leagues from shore. The Tower of Tignaux, erected on the shore so late as 1737, is now a French mile from it. A great proportion of this new deposit is solid rock, calcareous rock, which consists of carbonic acid gas and lime, which is held in solution, and deposited by the water. There is in the Museum of Montpellier a cannon taken up from the sea, imbedded in one of those rocks.

On the contrary, in Britain, the sea has been making great encroachments, especially on the eastern coast; rocks are crumbling fast away, the substance of which goes to form new rocks in other quarters—and towns and villages have been found inwards, or submerged in the waters. Many instances of submarine forests are to be met with—as, for instance, in Lancashire and the eastern coast of Scotland! while on the borders of the estuary of the Severn, the flats of Somersetshire and Gloucestershire have received enormous accessions of soil. It is said that St. Michael's Mount, now an insular rock south of England, was once situated in a wood several miles from the sea; and between the mount and the New-Lyn there is seen under the sand black vegetable mould, full of hazelnuts, leaves, roots, and trunks of forest trees, all of indigenous species. Thus it appears that our island is gradually retreating from the continent—with which it is probable it was once connected by dry land. Not even the "eternal mountains," therefore, as the poets call them, are stable—but all nature is subject to change, and the sea and the dry land are for ever encroaching upon each other, and varying the geography of the earth's surface.

TRUTH AND MYSTERY.

TO THE EDITOR OF THE SHEPHERD.

Some who think to stand upon the highest pinnacle of philosophy, fancy to have discovered truth, and say that truth is something without mystery. In my humble opinion, I should reverse the assertion, by saying that mystery is the offspring of truth—or, in other words, that truth which is not bounded in mystery is no truth at all. In fact, I know it to be true that there are but three primitive colours. Yet the why and because there are but three, and not four, primitive colours, is a mystery. I know that gravitation or attraction is a property of matter; yet the cause of gravitation, its real essence, is, and will be for ever, a mystery.

I know that magnetism, electricity, and galvanism, are but three different aspects of the same natural power, yet the essence of the power itself is a mystery.

If that be the case with things which are within the compass of the senses, how much must that be the case with the objects which lay out of the reach of our sensitive faculties!

Man is conscious of his reason, of his conscience, and of his self-determining faculty; but has he the means of measuring accurately, composing, and decomposing them? The existence of these faculties is known to man—this conviction is a truth for him; but is this very conviction not bounded with mysteries?

I hope that those who are engaged in the laudable task of reconstructing a new moral world upon the ruins of the old one, will carry demonstration along with them in their philosophical researches. When once they succeed in making themselves free from the swaddling-clothes of their infantine philosophy, they will stand with awe and veneration before the One great Mystery of Nature, and draw from thence the godlike spark that will enable them to impart life and permanence to their doctrinal creations; otherwise it must occur to them again, what has occurred to them hitherto; namely, to see their plans burst like bubbles before the laughing multitude of enemies of social reform.

A SOCIALIST.

[All mystery is the result of imperfection on our part. Man being finite, can never comprehend the immensity of nature. Hence nature must always be a mystery to him. Amid all the discoveries of science we have not yet attained to a clearer view of natural science than the most illiterate barbarians. Of effects we know much, of causes we know nothing. There is nothing more mysterious than motion—he who unriddles this mystery may call himself divine. However, there is much mystery in the world, and the government of the world, which may be got rid of, and will be got rid of, when the public mind is well instructed. Man will always be unmystifying, but never have done.—EDITOR.]

ASTRONOMICAL.

NATURE itself teaches men to class the stars. Amongst the number of stars with which the heavens are studded, there are certain groups which are more remarkable, and which on that account became the first constellations. Hence it followed that these constellations were discerned and distinguished by every people, ignorant and enlightened, as they now are by the peasantry. Such are the constellations of the Great and Little Bears, known by that name from the time of the Egyptians to our own days; the Pleiades, the stars of the head of the Bull, those of the constellation Orion, the two stars of the

Twins, &c. It is remarkable that the Iroquois have named the seven stars of the Great Bear *Okouari*, that is to say, the Bear—the same name which they received from the ancient inhabitants of Asia. The nation who people the border of the river Amazon, call also the Hyades, or the stars of the head of the Bull, "*tapiira rayouba*," a name which signifies in our language the jaw of the ox. These facts appear to point out an ancient communication between the Americans and the ancient Orientalists. Laffiteau asserts that these names were anterior to the arrival of Europeans in America. Certain other names have had their origin in a remarkable resemblance. That long white track which spans the nocturnal sky, has had amongst all nations names analogous to the ideas which it creates, but all these ideas have concentrated in that of "*the Way*." The Greeks called it the Milky Way; the Chinese, the Celestial River; other nations have called it the Great Way; the savages of North America call it the Way of Souls. In the Arabian and Copt, or Egyptian languages, it is called the Way of Straw, or stubble. The peasantry of France call it the Way of Saint James.—*Bailly Astronomie Ancienne*.

D I E T.

"The Pythagorean diet," says Buffon, "though extolled by ancient and modern philosophers, and even recommended by certain physicians, was never indicated by nature. If man were obliged to abstain totally from flesh, he would not, at least in our climates, either exist or multiply. An entire abstinence from flesh can have no effect but to enfeeble nature. To preserve himself in proper plight, man requires not only the use of this solid nourishment, but even to vary it. To obtain complete vigour, he must choose that species of food which is most agreeable to his constitution: and, as he cannot preserve himself in a state of activity, but by procuring new sensations, he must give his senses their full stretch, and eat a variety of meats, to prevent the disgust arising from an uniformity of nourishment."

We are told, on the other hand, that in the golden age man was as innocent as the dove; his food was acorns; and his beverage, pure water from the fountain. Finding everywhere abundant subsistence, he felt no anxieties, but lived independent, and always in peace, both with his own species and the other animals. But he no sooner forgot his native dignity, and sacrificed his liberty to the bonds of society, than war and the iron age succeeded that of gold and of peace. Cruelty and an insatiable thirst for flesh and blood were the first-fruits of a depraved nature, the corruption of which was completed by the invention of manners, arts, and sciences. Either immediately or remotely, all the physical and moral evil, by which individuals are afflicted, and society laid waste, arose from the carnivorous practices.

Both these representations are contradicted by the only criterion in such questions,—an appeal to experience. That animal food renders man strong and courageous is fully disproved by the inhabitants of northern Europe and Asia, the Laplanders, Samoièdes, Ostiaks, Tanguoses, Burats, and Kamschadales, as well as by the Esquimaux in the northern, and the natives of Terra del

Fuego in the southern extremity of America; which are the smallest, weakest, and least brave people of the globe, although they live almost entirely on flesh, and that often raw.

Vegetable diet is as little connected with weakness and cowardice as that of animal matters is with physical force and courage. That men can be perfectly nourished, and their bodily and mental capabilities be fully developed in any climates by a diet purely vegetable, admits of abundant proof from experience. In the periods of their greatest simplicity, manliness, and bravery, the Greeks and Romans appear to have lived almost entirely on plain vegetable preparations: indifferent bread, fruits, and other produce of the earth, are the chief nourishment of the modern Italians, and of the mass of the population in most countries of Europe: of those more immediately known to ourselves, the Irish and Scotch may be mentioned, who are certainly not rendered weaker than their English fellow-subjects by their freer use of vegetable aliment. The negroes, whose great bodily powers are well known, feed chiefly on vegetable substances; and the same is the case with the South Sea Islanders, whose agility and strength were so great, that the stoutest and most expert English sailors had no chance with them in wrestling and boxing.

The representations of the Pythagoreans respecting the noxious and debilitating effects of animal food are, on the other hand, the mere offspring of imagination. We have not the shadow of a proof, unless we admit Ovid's *Metamorphoses* and other poetical compositions, that this state of innocence, of exalted temperance, of entire abstinence from flesh, of perfect tranquillity, of profound peace, ever existed, or that it is more than a fable, designed to convey moral instruction. If the experience of every individual were not sufficient to convince him that the use of animal food is quite consistent with the greatest strength of body and most exalted energy of mind, this truth is proclaimed by the voice of all history. A few hundreds of Europeans hold in bondage the vegetable-eating millions of the East. If the Romans, in their earliest state, employed a simple vegetable diet, their glorious career went on uninterruptedly after they had become carnivorous; we see them winning their way, from a beginning so inconsiderable that it is lost in the obscurity of fable, to the empire of the world: we see them, by the power of intellect, establishing that dominion which they had acquired by the sword, and producing such compositions in poetry, oratory, philosophy, and history, as are at once the admiration and despair of succeeding ages: we see our own countrymen rivalling them in arts and arms, exhibiting no less signal bravery in the field and on the ocean, and displaying in a Milton and Shakspeare, in a Newton, Bacon, and Locke, in a Chatham, Erskine, and Fox, no less mental energy. Yet with these proofs before their eyes, men are actually found, who would have us believe, on the faith of some insulated, exaggerated, and misrepresented facts, and still more miserable hypotheses, that the development, form, and powers of the body are unimpaired and lessened, and the intellectual and moral faculties injured and perverted, by animal food.—*Lawrence's Physiology*.

ORIENTAL MYTHOLOGY.

In the Hindoo Mythology the coequal and eternal powers are Brahma, the creative power; Vishnu, the preservative; and Siva, the converting power. In other words, Brahma is matter; Vishnu, spirit; and Siva, time; and, in other senses, earth, water, and fire.

The Hindoos are now worshippers of Vishnu and Siva; the vulgar by idols, and the learned by the spirit of God in Vishnu, or Siva, for God is deemed too awful for address.

Brahma has four faces, for the four elements and the four castes, the priest, soldier, trader, and labourer. The sun is his symbol.

The Vedas teach that Universal Being is a conscious intelligent personality, which forms and sustains all visible and sensible things within itself, and by its own energies.

The Institutes of Menu assert that the supreme spirit alternately wakes and reposes for thousands of ages.

The Hindoos believe in the unity of God, and in subordinate deities, represented by the elements, stars, and planets. They teach a fifth element, which effects attractions, repulsions, &c., and they call the sun adetyæ, the attractor.—*Sir W. Jones.*

The Hindoos assert that the deity Vishnu has visited the earth in nine several incarnations, and that a tenth is to come. This opinion has the sanction of indefinite antiquity. The first *avatâr*, or incarnation, was the Matsya *avatâr*, the descent of the Deity in the form of a fish. 2d. Kaehyapa, or Kûrma, in that of a tortoise. 3d. Varâha, as a boar. 4th. Nara-singha, as a monster, half man, half lion. 5th. Vâmana, as a dwarf. 6th. Parasû-Râma, as the son of Jamadagni. All these took place in the *Satya Yuga*, or golden age. The others are more recent. The seventh incarnation is called *Ramachandra avatâr*, the descent of Vishnu to destroy a giant. Their contests are the subject of the celebrated epic called the *Râmâyana*. The eighth *avatâr*, called *Bala-Râma*, was in order to chastise other giants; the ninth, *Buddhâ*, had a similar object. The Kalki, or tenth *avatâr*, is yet to come, at the end of the *Kali Yuga*, or the iron age.

Sir W. Jones, More, and Mrs. Graham tell us, that the Indian *incarnate God*, Chrishna, lived about 900 B. C., had a virgin mother of the royal race, and was sought to be destroyed in his infancy. It appears that he passed his life in working miracles and preaching, and was so humble as to wash his friends' feet; at length dying, but rising from the dead, he ascended into heaven in the presence of a multitude.

The mortal parents of Chrishna were Vasedeva and Devaky. His father carried him over the Yamuna, to escape from the tyrant Kansa, who ordered all new-born infants to be slain. The ancient Hindoo picture, in Moor, of Devaky and Chrishna, is an exact counterpart of Raphael's Madonna and Child, with glories round both their heads.

The Hindoo Budha, or Buddh, is a deity, supposed, by Jones, to be the same as the Scandinavian Woden, and the Chinese Fo. He fixes the incarnation of Budha

in 1014 B.C., and that of Chrishna in 1800 B.C. The fourth day of the week is named after each.

Pilpay, the fabulist, was an Hindoo, of the name of Vishnu-Serman, and his fables were gleaned from the Sanscrit.

The Puranas are histories in blank verse, from the Creation to Buddha. The Vedas are philosophical discourses, or fundamental religious creeds.

Major Wilford, and other searchers into Brahmin mysteries, prove, very plausibly, that the gods of the Egyptians and Greeks were of Hindoo origin. The famous mysteries of Eleusis were concluded with the words *conax, om, pax*; and the Brahmins, at this day, finish their service with the words *canscha, om, paxsha*.

The Shastah describes the disobedience of certain angels, who were turned into Murdh, or men, as a purgatory.

The burning of women began in India from one of the wives of Brahma, the son of God, sacrificing herself at his death, that she might attend him in heaven. Others do the same; and an instance occurred of seventeen thus becoming voluntary victims at the death of their Rajah. It is a custom of all India, and called a *Suttee*.

The first sacrifices to the gods were fruits and flowers; but, as priests increased, animals were sacrificed to meet their own wants. The Hindoos are very bloody in their sacrifices of goats, &c.

Dow, in his History of Hindoostan, asserts that the word *Brahma*, in Sanscrit, signifies *wisdom*; and that the person so called is a mere allegory. There are some other odd confusions of the same nature; thus the word *Pythagoras*, in the Welsh language, signifies a *system of the world*.

The Shaster is the bible of the Brahmins, or Hindoos. The Gaura, or Parsees, in India, worship fire, as an emblem of the Deity.

The Hindoos refer their gods to the White Island, in the west, which some very plausibly suppose to mean Britain; and a likeness has been imagined between the country described in their history of Vishnu, and Wiltshire, in Stonehenge, Abury, &c.

Benares is one of the holy cities of the Hindoos, and a seat of one of their ancient observatories; the instruments in which are very large, and accurately constructed. Learned Brahmins reside here, who receive pupils from all parts of India. The city abounds in their temples.

The Brahmins, or priests, claim to be produced from the head of Brahma; and, they say, that the Chatriya, or Military Caste, were produced from his heart; the Vaisya, or Mercantile Caste, from his belly; and the Sudra, or Labouring Caste, they ascribe to his feet. The Brahmins monopolize the books and the learning, but both are filled with ancient superstitions. They are now mere logicians and metaphysicians, and their disputes are exactly akin to those of Europeans. The philosophy of Pythagoras, and the ancient religion of Egypt, appear both to be drawn from the Hindoos. Many of the Brahmins have latterly become soldiers, and hold offices in the state.—*Sir R. Phillips.*

FRENCH PHILOSOPHY.

THE following is translated from the original French of the "*Revue Sociale*," or Social Review, published every

month by the Society of Civilization and Progress, of which the Editor of the *Shepherd* is corresponding member for London. This society is established upon the most liberal of all principles, namely, that of admitting all sects and parties, and affording public lecturers, of every denomination, an opportunity of exposing and defending their own particular doctrines. Thus, during the course of the week, there are lectures by Jews, Christians, and Infidels, upon theological, political, literary, and scientific subjects; each advocate of a doctrine subjecting himself to the liability of being confronted by others of a contrary school, and having his system of philosophy brought to the test of collision. The following summary of M. Rancourt's lecture on the subject of "Life," is merely selected at random.

"The human body is composed of elements extremely variable; but there is not one of the particles or molecules which compose it, which does not correspond with the brain by means of the bowels, and which does not exert some sort of influence upon it. This species of influence, exercised by molecules, very different from each other, leads to the examination of their different natures and different influences; and this examination has led Professor Rancourt to perceive that we have within ourselves five distinct 'beings,' namely, the *living* being, the *sentient* being, the *loving* being, the *thinking* being, and the *central* being. The four first exercise upon the fifth such an influence, that it frequently acts merely in conformity with their will, instead (as it ought) of acting agreeably to its own will, and having regard to the particular and general interest of the four others. It is thus that often, influenced by the stomach, which is the principal seat of the living being, our conduct is under the influence of a good or bad digestion, of an appetite more or less disordered; that when we are afflicted with a complaint of the nerves, the *sentient* being, which receives the impressions with more or less acuteness, communicates them to the *central*, which acts in conformity with the sensations which are communicated. Also the *loving* being (*l'être aimant*), which has much connection with the sentient being, exercises a great influence upon the central being, and communicates to it its sentiments of love, friendship, courage, &c. &c., which are not always in accordance with reason; and, in fine, the thinking being, which has its principal seat in the brain, and which seems to be more perfect than all the rest, has an influence upon the central being by means of the impressions which it receives from the three others, for we must not forget that all these beings, or souls, or animals, as the Professor calls them, besides the influence which they exercise over the central being, exercise also an influence over one another."

These five beings, or principles, are merely modifications of one being, which M. Rancourt calls the *central*, which concentrates the whole within itself, and forms what we call ourselves; but where it is, and what it is, we know not; yet it must be in one place more than another, inasmuch as some places are more vital than others; it is more in the heart than in the arm, and more in the spine than the heart, and more in the head than the spine, but yet it is in all. The body is like a nation; the particles of the body may be called the population, the greater proportion of which exercise only an imperceptible influence on the whole, so that their death or abstraction is felt only by a neighbour or two, or a few relations; but there are some, and these are but few, whose death, or abstraction, or wisdom, or folly, causes a

sensation throughout the whole country. A king or prime-minister, for instance, has a perceptible influence on every individual, and on the fate of the whole community, and therefore he may be denominated the *central* being. Hence his actions are called the actions of the country over which he presides; thus, when the king of the French has determined upon any course of policy, we say that France, or the French, is about to do so and so, because he carries all the other *atoms* of the kingdom of France along with him. Judging after this fashion, we might conclude that our bodies are merely moving kingdoms of atoms, and that one little fellow of an atom has got the rule of all the other atoms; that this little fellow, like the king of Great Britain, has collected a court around him, in which there are high atoms and low atoms, and atoms of every degree, and that what we call the vital parts, are the aristocratical atoms, and the most vital of all, wherever it be, is the king of the atoms, and that must be our ownself. But as a king always falls when his court or his nobles fall, so to produce death, there is no occasion to find out and personally assassinate the little gentleman himself. The derangement of his *vitals* stops his supplies immediately, and he throws the sceptre of life away, and the kingdom is dissolved. Now, though this be all very funny, it is also all very natural, and nobody can gainsay it; our *will* must be somewhere; it is the executive power; and to say that it is *nowhere* is absurd; and to say that it is in many places is equally absurd, for the many atoms must help to make it up, yet one atom must have more power than all the rest, and send its decrees like electricity through the whole population.

Rancourt's five beings very much resemble the five senses. Tasting, smelling, hearing, and seeing, are all local senses, but feeling is omnipresent; it includes all the other four, so that we have only one sense, differently modified. Feeling is the king of the senses,—the *central* sense. There must always be a centre of action for every movement; even in a republic there must be a temporary king, or president; and even in a council there must be a leader. More than one moving cause creates division. He may have innumerable assistants; but without concert, without individual superiority or generalship, there would result either universal stagnation, universal confusion, or division into sects and parties under different leaders.

Sacred

TO THE

MEMORY OF MARGARET WILKS,

Who, after a short period of the most excruciating suffering, which she endured with exemplary fortitude and patience, returned to the bosom of Nature on Wednesday, August 20th, 1834, in the 19th year of her age.

Adieu, sweet maiden! o'er thy stainless brow
The dew of death is scatter'd like a frost
Which nips the rose-bud in its sweetness. Oh,
That thus our hopes should fade, for ever lost!
Where is thy bright eye's lustre, where its glow?
Thy bark's no more on life's rough ocean toss'd;

Too brief thy race, and memory stays to shed
The tear of sorrow o'er thy clay-cold bed.

Short were thy suff'rings, but severe: tis past!

But still affection lingers round the spot
Where thou art laid—of earthly homes the last.

Unmoved by all, forgetting, and forgot.
Such is our life; we weep, smile, eat, drink, fast;
Then drop into the grave, and there we rot!

But the sweet perfume of thy name imparts
A pang—a joy—to aching, saddening hearts.

Thy only fault was youth—thy greatest crime
Was innocence, unblemish'd as the day,
When bright Aurora, from her car sublime,
Sheds her effulgence on the sparkling spray.
Still, still thou hear'st not, for the hand of Time
Destroys, and then consigns to dull decay.

Now, envy, vent your spleen, but know your breath
Can never agonize the ear of Death.

She fell, untainted by the world's deceit;
Hypocrisy her inmost soul abhor'd;
Falsehood she shunn'd, and left its dark retreat;
Truth was the only power she e'er adored! (1)

Whatever feeling rose, or wrong or meet,
By fancy led, or passion's pinion soar'd,
Her countenance explain'd, and there you read
The image of her thoughts, and all she said.

But yesterday I saw thee, blooming, bright,
Radiant with beauty, volatile, and free;
And now those orbs are closed in endless night;
And nature beams, alas! no more for thee.

Oh! that one stroke, unsparing, thus should blight
Bud, bough, and blossom, with the promised tree!
And breasts will heave, and eyes will shed their tears,
Grieved to behold the wreck of future years.

Round thee our ruder loves did all entwine,
As round a cherish'd plant, whose tender form
Shrunk from the blast which rends the lofty pine,
Bending beneath, but shelter'd from the storm.
Thy guileless bosom was a hallow'd shrine,
In which each purer impulse nestled warm.
What art thou now? a clod!—The cypress weeps,
And showers her tear-drops where thy spirit sleeps.

In life affectionate, and even when
Anguish intense a moment's respite gave;
Thy sinking energies would rally then,
To scorn the horrors of the yawning grave.
Death had no terrors, nor the darksome den
O'er which the wintry tempests howl and rave;
Thy tranquil smile, endearing, well might prove
A Stoic's fortune, a daughter's love! (2)

But few could act thus nobly—fewer still
E'er knew the value of that nobler mind,
Which cast a ray of cheerfulness at will,—
Precocity and playfulness combined.
The fluttering form—the laugh—the holy thrill
Of deepest sympathy for all mankind,
Lie quench'd for ever in that resting-place,
Seal'd in Eternity's long, long embrace!

No pomp sepulchral mock'd thy early fall; (3)
No flattering stone, or lying epitaph;
No waving plumes bedeck'd thy humble pall;
No hiring mourners, with ill-stifled laugh.
The few who follow'd, honour'd—loved thee—all
On thee their hopes were built—the prop, the staff:
And ever towards thee as we turn our eye,
"Twill wring the honest tribute of a sigh.

Once more, farewell! thy morning sun is set;
Life's fitful dream is o'er—the scene is closed!
Love, hatred, sorrow, joy, remorse, regret,
Reach not where thou in silence art reposed.
A few brief hours will bring our turn, ere yet
Thy worth or virtue shall have been disclosed.
Hail to that refuge! so serene to me
Thou seem'st, dear girl, I fain could envy thee!

J. BANKHEAD.

(1) The father of this unfortunate young creature has frequently declared to the author of these stanzas that he *never knew her to tell a lie*; and those who were best acquainted with her will find no difficulty in giving credence to the assertion.

(2) Fact; to such a pitch did she carry her filial regard for her only remaining parent, that, with a firmness which would not have disgraced the most illustrious examples of antiquity, during the intervals of the paroxysm, she endeavoured, with the full conviction of her approaching dissolution, to divert the attention of those around her from the consideration of her own case, to the immediate and future necessities of the living. And whatever might have been the peculiarity of her theological opinions, one thing is certain, that she had long considered death as a necessary event, which must take place at one period or another, and which she never, for a moment, feared. See how calmly a philosopher can die.

(3) One of the most striking features in this touching affair was the extreme simplicity with which the funeral was conducted: none of the paraphernalia of woe were resorted to—plain, natural, and unassuming, like the character of her whose loss was then deplored. "No maimed rites" were performed, which tend alike in too many instances to insult the memory of the departed, and lacerate the feelings of the survivors; but the earth having covered her remains from the sight, Mr. Simpson having intimated his intention to deliver an address on the occasion, the by-standers collected round him, "in all the silent manliness of grief." He then proceeded, in a strain of the most simple and moving eloquence, to descant on the uncertainty of life, exhorting all who were present to active exertions in their respective spheres of usefulness, since there was neither work nor device in the grave. He offered, in conclusion, a few remarks on the character and disposition of the deceased, stating the sanguine hopes that were entertained of her by many of her friends. Here his voice became several times almost inaudible; he was evidently participating in the general sympathy; here, perhaps, a sigh or sob escaped, but it was immediately checked—there a tear, but it was instantly dashed away, and reserved for that situation when the heart pours out its overflowings in solitude and silence. In his discourse there were no polished periods to set it off; no gloss of art, which deludes the judgment while it gratifies the ear; but it seemed to spring spontaneously from the heart, welled out fresh from the fountain of human feeling.

This impressive scene will not speedily be forgotten by those who witnessed it.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 2.]

SATURDAY, SEPTEMBER 6, 1834.

[Price 1d.]

SYSTEM OF NATURE.

LAST week we gave a general view of Nature, drawn with as much simplicity and accuracy as the present advancement of chemical science will admit of. At this simplicity and accuracy we shall always aim, inasmuch as we aim at the instruction and cultivation of the public mind, and not at the defence of any particular system of intricate philosophy, which is not even intelligible to its own select and initiated few, and can never interest or benefit the many. Those who desire to study the details of science, and enter with spirit into the controversies of experiment and theory, have abundant opportunities, in this age of facts and theoretical novelties, to gratify their intellectual appetites. For such appetites we do not write. We are desirous only of establishing first and general principles, from data or facts which are universally acknowledged, and pointing out to our readers a correct mode of reasoning from such facts, and analysing the laws of material and mental existence. Men have, in all ages, argued erroneously upon the natural facts with which observation has made them acquainted; and they have been deterred in the first place by superstitious fears, and ultimately by false teaching, prejudice, and bigotry, and all the other train of moral tyrants, which usurp authority over the ignorant mind, and shut the senses to the intromission of truth.

Last week we examined nature in her threefold character; this week we shall take a view of her twofold being, which is equally important to consider. This twofold being merely consists of two opposites—hardness and softness, light and darkness, &c.—two opposite extremes, the union of which creates all the intermediate varieties. In all ages of the world mankind have been in the habit of associating the idea of good with the one, and of evil with the other. Thus, a hard heart is a bad heart, and darkness is the type of infinite and eternal evil, of which the devil and the demons of darkness are the undisputed sovereigns. This is peculiarly the case at the present time, perhaps more so than at any former period. David clothes the God of Israel with clouds and thick darkness, and Solomon says of him that he loveth to dwell in the thick darkness; but the prevailing custom of modern times is to invest him all over with light, and to put the robe of sable hue on his dusky adversary. Now there is, surely, something extremely erroneous in the comparative estimate which we make of these two properties of Nature. They are both alike necessary to our happiness, both alike necessary to our existence. If it is a pleasant thing for the eyes to behold the sun, and

to see the light of heaven, it is also pleasant to repose at the close of day in the gloom of midnight, and to refresh the sight by a total abstraction from the visions of nature. The alternation of light and darkness, and the suitable admixture of light and shade are the *beau ideal* of visual nature. The two foes, or rather friends, are never found apart. Light exists in the very darkest penetralia of midnight, and the projecting shadows of visible objects check the variegated scenery of light by the bold relief of graduated darkness. Which of the two is the good, and which is the evil? The slavish mind, whose superstitious terrors have usurped the place of his reasoning faculties, alone can tell, and he pronounces the judgment with fear and trembling.

So much does Nature delight in contrasts, and, in fine, so necessary are they to her existence and harmony, that almost all the vegetable poisons exist in their natural state in a combination with sugar or mucilage. There the two parties lie like faithful consorts, in each other's arms, till the rude hands of chemical decomposition do violence to their affections, and force a separation between them. Poison and sugar! the evil and the good of nature so kind and so loving! Yes! "*'tis true, and pity 'tis 'tis true,*" says some one, whose pious zeal would never stop, if the power were equal to the will, until a complete divorce were effected between all the opposite elements of matter. Sublime enthusiasm! that, in its attempt to destroy evil, would extirpate good at the same time, and annihilate Nature herself in the act of vengeance. But vain is the wish, and not more vain than foolish and ignorant. Poison is not, an evil in itself. All that we can say of it is, that it is a powerful chemical agent, and its component parts are the same as those of animal and vegetable food. Opium consists of the very same original ingredients as beef-steaks; the proportions only, and the modes of combination, are different. But powerful agents are as useful in nature as weak agents. It is owing to our weakness that we cannot withstand them. Is not the hardness of the diamond valuable in cutting and grinding what a soft substance would be unable to scratch? and poisons are equally valuable, with potent energies of another description, in fusing metals, and decomposing solids and earths for the materials of the arts of life. Arsenic and lead are employed by the glass-maker in melting glass; and if these deadly poisons are productive of evil when lodged in our stomachs, they are our welcome friends when they contain a draught of generous liquor in the shape of a crystal goblet, or a green bottle. Pray, what could we do without the poisons? Nature would die of a consumption—pining away in

heartless sorrow for the loss of her strength. Good and evil, then, as applied to food and poison, are very improper terms, and greatly delude the ignorant. There is evil in none of the elements of nature: all is good—the evil is merely relative to ourselves, and exists only in the ignorance or imprudence that makes an improper use of the different compounds that surround us. Let us only learn by experience to use the strength and the weakness of Nature aright, and we shall come to the conclusion that nothing is wanting to make of this earth a paradise, and of man a god. We pity the dull and the heartless philosophy that vilifies the character of Nature, by the association of necessary and irremediable evil with her name. There is an antidote for every poison within her great laboratory; there is a work of mercy and benevolence for each, and the final harmonious co-operation of all her agents, which in due time will be accomplished by the experience and ingenuity of man, will refute the calumnies of half-bred philosophers, and efface the spots with which their ignorance has deformed the countenance of their common mother.

The three elementary or distinctive substances of Nature may be classified into two, solids and gases; or those which attach themselves to the surface or body of the earth, and those which inhabit the firmament. The gases possess the power or the movement, and these correspond in analogy to the more refined and spiritual powers which make up the composition of a thinking and intelligent being. The body and the mind are our two great component parts—their connexion, their action and reaction on each other, we know nothing of—but to judge from the analogy of nature, we may safely infer that they are *one*, and *not two* distinct and separate existences. The air which encircles the earth is merely a decomposition of the material of the earth itself: the oxygen and the nitrogen exist in the soil, and the incessant action of different agents upon each other is everlastingly creating new separations of the elementary gases, which rise and unite in the firmament above: whilst, on the other hand, the fixation of atmospheric air is incorporating the old atmosphere with the solid earth, and effecting new combinations over the whole terrestrial surface. Thus the earth and the air are one—the prototypes of the body and the mind are the same in substance, mutually exchanging position and properties with each other; and all the analogies of Nature point out this plain and simple truth, that every element of Nature is connected with, related to, or dependent upon, every other element—that there is no such thing as the independent existence of parts, but perfect unity combines them all in one harmonious whole. This view of the subject has no connexion with any religious doctrine of immortality and futurity; it does not affect such a question either affirmatively or negatively. Of the modes and possibilities of existence we know little, and ought to affirm little; but he is more to be pitied for his folly than admired for his wisdom, who sets limits to the wonders of all-creative Nature. THE SHEPHERD.

A ROOT OF EVIL.

“AND pray, my dear Shepherd, what good can come out of a root of evil? You are so fond of paradoxes!”

“Be patient a little, my dear lady, and do not prejudice the subject. How came you to discover what use I meant to make of the root of evil?” “Oh! catch a woman making a mistake in a case of suspicion! I know you mean to make something good of it; it is just your way, and a very wicked way it is.” “Not quite so bad as your hasty judgment. But come along, give me your arm, and we shall discuss the question in yon sunny glade, under the shadow of the old hawthorn. Here it is, and a root of evil you must admit it to be; see how prickly it grows! How sharp these thorns are! how vengeful against those who venture to attack its person, or rob it of its branches! Yet how beautiful its blossom, how fragrant the odour with which it perfumes the air! And look, my dear, at this root of evil—look at the topmost branches, one of which I have now pulled down with my shepherd’s crook. See, there are no thorns upon it. The thorns have all become branches, and are as innocent as the lambs that now nibble on the lawn.” “How is that, ‘Pastor Fido;’ how dost thou account for that circumstance?” “I know not, but so it is, that the thorns are only the first growth of infamy; but as the plant ascends into the light of heaven, it loses its ferocity, and becomes pliant as the other trees of the wood. It is so with the holly, and all the other thorny tribe. The peasants say that it is so ordered by nature, for the protection of the plant; for the cattle would browse upon its branches and leaves, and men and children would injure them with impunity, if, like the bee and the wasp, and other armed insects, they were not provided with the means of defence; but as the uppermost boughs are protected by their height, the armour being no longer necessary, is consequently withdrawn. This is the philosophy of the peasant—but why should the thorn be better protected than the beech, or the hazel, or any other helpless plant? The peasant cannot tell. The peasant, however, may be right; some shrubs are necessary for fences, and nothing can be better adapted for the purpose than this host of spears with which they are invested. But at present I feel less disposed to investigate the reason than the moral of the fact—which is one of the many types by which nature in silence communicates instruction to the enquiring mind. The tree itself is the type of man and human society. The thorns at the bottom are the evils which result from ignorance (for you must know that it is chiefly from want of cultivation that there are thorns at all; the tree by proper culture can be reared without them, but it requires much care). Errors, divisions, political and religious contests, tyranny, bloodshed, and poverty—these are the thorns that grow around the root of human society, until, by the progress of science, and the elevation of the mind and morals of our species, these horrors disappear, and are all divested of their hurtful properties; for as the thorns at the top are converted into branches, so the active and contentious energies of men, which now create such an accumulation of misery, shall in due time be engaged in more peaceful strife, hastening forward the progress of the arts, and cultivating the garden of life. That which we call a root of evil, is merely an active principle of nature misdirected, or deprived of opportu-

nities of exercising its native energies to the production of positive good. Whilst man remains in a state of inexperience and ignorance, before he has surveyed the surface of nature, and penetrated the secrets of its internal structure; before he has discovered the virtues of metals and earths, liquids, and gases—learned to control their power, and make it subserve the magnificent designs of science; before he has discovered the science of association, and the benefits derivable from united exertions; before he has opened up a free communication of thought between the various kingdoms and provinces on which the offspring of humanity is scattered; he must be a rude and unpolished thorn, a barbarian, more savage, more foolish, more intractable than any other being in the world, inasmuch as his mental energies being greater than those of any other animal, must be the occasion of greater mischief, until the time of reformation and elevation, in which the light of science and the experience of evil shall give a wise direction to his active movements. Thus man, on account of his intellectual nature, is first the worst and afterwards the best of animals—full of thorns and clad in armour in his first growth, innocent as a myrtle or an olive branch when time has matured the species into manhood.” “Oh, Shepherd, how foolish I was! Now I shall die for the love of evil after this. You have made me quite naughty. I shall give you one kiss, and run for shame.” [Exit.]

A LESSON FOR FOOLS.

If the hands be placed for some time, the one in very hot, the other in very cold water, and both be then removed to water of an intermediate temperature, the impression made upon the heated hand will be a sensation of cold, whilst the chilled hand will feel a glow of heat from its change of situation. In this experiment the heated hand has had its vitality comparatively exhausted by the superior stimulus of the hot water, and is therefore less excited by the tepid fluid than the cooled extremity, whose vital power has been relatively accumulated by its previous exposure to a low temperature. Persons leaving a frosty atmosphere for the shelter of a warm room, thus experience pain, a prickly tingling and flushing of the skin, from that moderate degree of heat which is barely comfortable to those who have not been so exposed to cold. It is in consequence of a similar accumulation of excitability, resulting from the winter's inaction, that vegetation commences in the spring at a temperature which in the autumn is insufficient to maintain life in the exhausted foliage.

The applications of this law are endless. The Russians, taught simply by experience, accommodate themselves to its dictates in their treatment of organs attacked by the severe frosts of their climate. The exposure of the body to these excessive low temperatures so far increases their susceptibility to the peculiar stimulus of heat, that its sudden influx produces a reaction instantly destructive of life. When, therefore, a limb has been frost-bitten, the first application which is made to it is that of a gentle friction with snow, which, being a few degrees above the

temperature of the atmosphere, becomes a stimulus to the part proportionate to its new condition, and excites in it as much action as is consonant with a return to health. The stoppage of the circulation which extreme cold thus produces, is unattended with pain; persons are therefore liable to fall unconsciously into this state, and so to enter into heated apartments. When the frost-bitten organ has its excitability totally destroyed, gangrene ensues, and the part is irrecoverably lost.

From the foregoing circumstances, it seems probable that the catarrh, that vexatious torment of our insular climate, is the more frequent result of a sudden transition from cold to heat, than (as is usually imagined) from heat to cold. It is true that catarrhs are frequently caught by exposures to the night-air after leaving crowded assemblies; but the generally exhausted condition of the frame at that period of the day, which renders it more prone to irregular action, will explain the fact. The injury also may be attributed, in these cases, to the return from the open air to the warmth of the bed-chamber; and there is this additional reason for such a supposition, that persons walking home, and entering the house with that glow on the surface which is produced by exercise, are less likely to catch cold than those who return under the shelter of a covered carriage.—*Dr. Morgan.*

All sudden movements do violence to the object upon which they act. To reform and to destroy, are two modes of action, which differ only in their degrees of rapidity. Destruction is sudden, reformation is deliberate and gradual. The same laws of nature reveal themselves in the intellectual and moral, as in the physical world. When we have any very grievous tidings to convey to a person of delicate nerves, we seldom communicate the whole at once; we prepare the mind by fear and anxiety, before we venture to disclose the melancholy truth. We treat a frost-bitten potato in a similar manner: instead of giving it a sudden transition from cold to heat by putting it into hot water, we steep it first in cold water to prepare it for a higher temperature; and thus by gradually exciting its parts, we restore it to its primitive health. A sudden change of temperature would destroy it for ever.

The moral of such interesting laws of nature is simple and intelligible to all. They are universal laws—first principles—pervading all mind and matter—and, if well impressed on the mind, are sufficient to trace out a path of prudence and success in a thousand instances, where folly generally urges men to fly from one extreme to the other, ignorantly concluding that, if the one has proved false and mischievous, the other must be all that is good. They are both false and mischievous, as the experiment will demonstrate. But experience only can teach fools wisdom, and fortunate it is if even experience suffice. We might easily reason ourselves into the right way; but who will reason? Society presents only the fearful sight of two hostile extremes. “What can we see in the Shulamite?” says Solomon. “We see as it were the company of two armies.” Only the frost and the hot water for the potato, and both are FATAL.

FAIR ANNE.

A Fragment: founded on Fact.

Anné was fair, affectionate, and kind,
Of gentle temper and a feeling mind;
She had a soft insinuating way
In all she chanced to do, or chose to say;
A mild and winning charm in every look,
A grace in every gesture she betook;
Sweetly disposed—as harmless as the dove,
And had a soul susceptible of love.
Thus Edward found her. * * *

* * * Two summers fled.

She felt the gnawing pangs of silent grief,
Yet dared not vent her sorrows for relief.
Her throbbing bosom heaved with heavy sighs;
The tears suffused her sweet expressive eyes,
And from her blooming cheeks the fretting dew
Had washed the pretty tint of rosy hue.

Her sad demeanour was not unperceived;
The *Mistress* oft enquired why she grieved;
Evasively she answer'd, nor reveal'd
The fatal tale her aching heart conceal'd.
Unwilling to confess, poor Anné wept;
A thrilling stupor o'er her senses crept;
She hung her head to shun the anxious gaze,
And faintly tried her feeble voice to raise.
Her quivering lips bespoke a thousand fears;
Her eyes pour'd out a flood of bitter tears.
Her bosom heaved, again to speak she tried;
Her tongue refused its utterance, and she sighed.
At length a gleam of courage touched her soul,
She sighed again, and stammered out the whole.
And now began the matron to declaim,
Regardless of her victim's woe and shame,—

“Is this the faultless Anné, so renown'd
For gentleness and modesty profound?
Base creature, leave my house this very night,
Nor dare to come again within my sight!”
Anné retired, confounded and distress'd,
To obey the storming matron's harsh request.
And now, the fact discovered, babbling fame,
With speedy progress, stigmatized her name.
Gossip to gossip ran from house to house,
Each venom'd tongue engaged in vile abuse,
Quick on the wing the scandal flying fast,
Her father caught the unwelcome news at last.

Meanwhile poor Anné pack'd her little store,
And wander'd weeping from the closing door;
Slowly approaching to a fearful storm,
Her father's anger and the neighbour's scorn;
Mourning the while at her unhappy lot,
At distance she perceived her natal cot;
Her wrathful father 'gainst the threshold lean'd,
With sullen countenance and heart chagrin'd;
Thus she beheld him, and with trembling fear,
In deep humility of soul drew near.
His eye forbidding on the sufferer glanced,
And thus he harshly spoke as she advanced:
“Ah! wretched girl! you've spoiled a decent race,
Before unblemish'd—free from all disgrace;
Yes! you have blasted all—begone from hence!
I shun you as I would a pestilence!”
Unnerved and overpower'd as with a spell,
Against his breast the weeping maiden fell:
“O father, take me in for mercy's sake;
Pardon your child—her heart is like to break.
If you reject me, whither shall I go,
Oppress'd with grief and languishing with woe?”

“Away!” he cried, indignant, grieved at heart,
Forgetting in his rage soft pity's part;
“Away this moment from your father's door,
And never call yourself my daughter more!”
Poor Anné, now a martyr to distress,
Stood petrified with horror—motionless.
Thus for a moment; then, her heart convulsed,
Soon every gleam of soothing hope repulsed;
O'erwhelm'd in grief, fatigued and spent,
She moved away, not knowing where she went;
Distracting thoughts upon her fancy crowd;
Still she was mute and murmur'd not aloud,
Till, straying near the sea, from view remote,
She freedom gave to her imprison'd thought;
She spoke of Edward now without control;
False as he was, she loved him in her soul.
“Edward,” she cried, “ah, cruel Edward, why
Didst thou seduce a helpless maid like I?
Rob me of that which women hold so dear,
The loss of which has brought me wretched here?
Wretched, indeed, with horrors to contend,
Without a kindly sentence from a friend.
When will my awful misery have an end?”

While thus her sad misfortunes she deplored,
The lightning flash'd, the mighty thunder roar'd.
Pausing awhile, the frightful scene she view'd,
And thus her melancholy theme pursued:
“Ah! my poor heart, see what a dismal night!
My soul as dismal startles with affright.
Great Heaven, the elements chastise me too!
Where shall I fly? What must I do?
O! that the lightning fleeting o'er my head
Would rapidly descend, and strike me dead!
Strike! thunder, strike! and let me breathe my last:
I'll climb the rocks, and brave your hardest blast.”

True to her word, the hapless girl ascends,
And with the boisterous wintry winds contends.
The summit gain'd, awhile she wav'ring stood,
Tempted to plunge into the raging flood.
Its rough tempestuous surface made her shrink,
Till, half resolved, she moved towards the brink.
The rugged breeze distress'd her gentle form,
And as her fears increased, so did the storm.
Her yielding garments and dishevell'd hair,
Mark'd her the wretched victim of despair.
Now in her head she felt a burning pain,
Frenzy began to kindle in her brain.
Wildly she look'd, but wilder still she grew,
In raving madness round the rocks she flew,
And talk'd of horrid things, of death and hell,
Till, overbalanced, from the brink she fell,
Snatching with eager grasp at all she pass'd,
And caught a jutting piece of rock at last.
Tenacious yet of life, she kept her hold;
Winds blew above—beneath the waters roll'd;
Impendent thus, upon the troubled sky
She fix'd her deep and melancholy eye,
And thus she pray'd—“O God! of pow'r supreme,
Distress has driven me to this extreme;
Pardon my sins—forgive this dire offence:
Behold my grief—receive my penitence.
Forgive my father—Edward—all my foes,
And grant this be the finish of my woes.”
Exclaiming thus, she firmly still hung on,
Till strength, and voice, and life were almost gone.
She gave one feeble gasp, and that was all;
Her soul and body parted in the fall.
The billows, closing with impetuous force,
Roll'd rapidly away with Anné's corse.

PHILANTHROPIC ESTABLISHMENT.

From "Le Caméléon;" translated from the Russian.

NICOLAI STEPANOWITSCH ISCHORSKI, a rich gentleman in the neighbourhood of Moscow, desirous of distinguishing himself and acquiring reputation by a generous distribution of his fortune, founded an hospital for the sick of his village. The governor of the province, during a tour in the country where he presided, signified to Ischorski his intention of dining and passing the day at his house. The latter, delighted with so great an honour, invited all his neighbours, and made every kind of preparation to receive his Excellency in a suitable manner.

"But must I wait for ever upon the Doctor?" said Ischorski. "Troschka, go and tell him that I have been waiting impatiently for him for two hours. Ah! here he comes. In the name of heaven, my dear Sergei Ivanowitsch, there is no getting a word with you."

"I beg pardon for having caused your anxiety," said the Doctor, saluting Rosslawlew and Surski; "I have just been visiting the hospital."

"That is precisely what I called you for: well, is it all in order?"

"I think it is."

"That's right, that's right. There has been much talk about my hospital in the province. We must not belie our reputation with his Excellency. The pharmacy, is it all in good condition, and well arranged?"

"All as usual, Nicolai Stepanowitsch."

"All as usual! How is that? did I not tell you? I have explained myself clear enough. To-day his Excellency the Governor comes, and we must—Do you understand me now, my dear—one must always show his merchandize on the best side."

"I have had the honour of informing you that all was in good order."

"But in the hospital?"

"The windows are cleaned, and the roofs are wahsed; the linen is clean."

"Have they taken care to suspend above the beds the labels that indicate the species of malady?"

"As to that, it is not very necessary, since the hospital contains only ten beds. I have put up two labels to please you."

"Are the inscriptions in Latin?"

"In Latin and Russian."

"It is well, my friend, it is well: and how many patients have you?"

"At present, we have only one."

"How! how! only one!" cried Ischorski in the greatest consternation.

"Only one, my lord; I sent away the last the day before yesterday. It was Elias the coachman."

"And why did you send him away?"

"Because he was cured."

"And pray, who told you that he was cured? How did you learn that? Is it possible?—only one patient! Come now, gentlemen; found hospitals after that—Only one patient!"

"What evil do you find in that, then, my friend?" said Surski.

"How can you ask such a question? Thou understandest well enough. Only one patient! Must I then show empty halls to the Governor? May heaven bless you, my dear Ivanowitsch! you have purchased for me great satisfaction indeed! only one patient!"

"But, in the name of heaven, what could I do?"

"What could you do? permit me to ask you one single question. For what do you receive your living? I pay you one thousand roubles per annum, with lodging, food, and equipage—and only one patient! Is that the way to conduct yourself? what can be the meaning of that? I must allow that my sister has good reason—that's the consequence of taking a Russian physician—only one patient!! Ah my God! my God! truly, my very good—I am very much obliged to you—you have given me a very fine feast—only one patient! Bravo! master doctor Russ—bravo! But cost what it will, I shall have a German physician—yes, Sir, a German physician; then we shall have no lack of patients—Lord God! only one single patient—yes! laugh, sirrah, laugh; what is that to you? you have got no hospital to show to his Excellency the Governor."

"What is your opinion Rosslawlew?" said Surski; "ought we not to counterfeit patients to help us out of this embarrassment?"

"Truly, brother, that is a pleasantry very ill-timed."

"I speak seriously. The Governor will never feel the pulse of the patients. The principal thing is, that the beds be not found empty."

"That idea is not bad—stop—in fact—eh! Troschka, tell my intendant to come to me immediately."

"What is your purpose?" demanded Rosslawlew.

"Stay, brother, stay; perhaps we shall find the means of getting us out of this embarrassment. It is not necessary to reflect long upon it. It is not a great matter, merely to be a day in bed."

"How? you would?"

"Peace, brother, do not trouble me! It is good; I am determined upon it! Return then, in the name of heaven, to your domicile, Sergei Ivanowitsch, but let not that happen again. We shall find the means of getting patients without him."

"Listen, Parfen," addressing himself to the intendant, who had arrived, "is it then true that we have no patients at present in the hospital?"

"Thanks be to heaven, my lord, we have only one!"

"Thou art a sot, an ass, even to the very marrow of thy bones! Thanks be to heaven! What! we must, then, show to the Governor the four walls! I must absolutely have patients. Dost thou understand me?"

"Very well, my lord; but where is it your pleasure that I should find them?"

"That matters not—so be it that there they are."

"That is very well, my lord."

"Attend then, Parfen! Thou art terribly changed—art thou really well?"

"Oh yes, my lord, and I thank God for it."

"Thou wilt do well to take care of thyself, thou art very blue about the eyes. Truly, Parfen, thou art a patient; won't thou suffer thyself to be cured?"

"In the name of heaven, my gracious master, Nicholai

Stepanowitsch, have mercy on me! You will find, without doubt, plenty of patients without counting me."

"I don't doubt it; but lose no time, go and seek 'em."

"But what are your commands, suppose I find no one of a mind?"

"Put such a question as that, you fool! Go, run to the village, and bring the first fellow you meet in spite of his teeth; shall I not be master in my own domains?"

"Without doubt, my lord; but would you not prefer a man of arms for this service?"

"That is not a bad idea! but at all events you must bring only people of a feeble health. It is only the department of dropsy for which we require a large plump patient."

"Permit me, my lord. I might propose the thing to the Sacristan; he has a most respectable corpulence, and his face is really squash."

"That's right; try to persuade him."

"For a rouble and a half, I answer for it that he will counterfeit for four-and-twenty hours, not sickness only, but death if you like."

"Give him a rouble. But know you none of a very meagre look for the consumptive department?"

"Meagre! Let me see! Yes, I could not get a better. Andrews, the shoemaker, has not a bit of skin on his bones; you won't find a match for him in all the village."

"Ah! 'tis true, 'tis true! Thy words are gold, my dear Parfen—I thank thee, my child: see only that every thing be well arranged. Well, now we have got two patients. As to the rest, I leave them to thy choice; but above all, beseech them to remain quiet during the visitation of the hospital."

"That is well, my lord."

"To make not the slightest movement, not even to take off their cotton caps; and that they sigh most wofully."

"That is well, my lord."

"Now go, and may God be with thee! Thou art laughing, Surski? I know very well that it is ridiculous, but what could I do? I am resolved to distinguish myself by some means. My neighbour Haras has a stud that might be compared with mine; the Princess Sorin has an orangery much larger than mine; but no one has yet thought of having an hospital—an't that true, my friend? Besides, these things are now '*a-la-mode*.' No, it an't '*a-la-mode*;' I would say—"

"According to the spirit of the age," interrupted Ross-lawlew.

"Yes! according to the spirit of the age. An hospital, brother, seest thou, is an economical establishment, that is to say—what do they call that? Stay—"

"Philanthropic," said Surski.

"That's it, that's the word—philanthropic, and these establishments are now in vogue, my dear. Who knows, when the Governor shall have seen it, perhaps fame shall mount still higher, and then—in fine, man proposes, and God disposes. That which is to happen must happen. But only think—suppose I were to show an empty hospital, what effect would that have? Any one may build a house, and there is nothing very bad in writing the word 'hospital' on the door of it."

The company arrived, and seated themselves at table. After dinner all the guests followed their Amphitryon into the garden, from which they betook themselves to the orangery, the stalls, the kennel, and the hospital. Ross-lawlew, pre-occupied with a conversation which he had with his betrothed Pelageia de Nidin, in which he besought her to defer the day appointed for their marriage, after having followed the company into the orangery, thought he might dispense with following it much farther, and remained in the garden with his friend Surski, to whom he confided his troubles. In the midst of their conversation he cried out—

"But I see our host coming.—See, my friend, how he is agitated!—What now, Nicolai Stepanowitsch?" added he, going to meet him.

"What now?" replied Ischorski, with a stifled voice; "Nothing—absolutely nothing—only that I am for ever dishonoured, annihilated, interred alive; that's all."

"And how so?"

"You do well to ask that! Ah! saints of paradise! permit me at least to breathe; the fools! the dogs! the scoundrels!"

"You alarm me. Tell me, what has happened?"

"A bagatelle, I tell thee. All my cares, all my pains, all my expenses, are gone to the devil! But I know how to recover them. There, *par dieu*, there is a learned doctor for you! he, a doctor! he is nothing but a rascally barber! From this day henceforth he shall go out of my house."

"Ah! ah! it appears that it is respecting the hospital that thou art disquieted."

"My hospital! What hospital? I have no hospital now! To-morrow I shall demolish this cursed hospital, and leave not one stone upon another."

"But tell us, at least, the cause of such great indignation."

"The cause, brother, the cause has caused me a mortal chagrin. Imagine to yourself; I was showing my establishments to my guests; the hospital in its turn. At first we go into the pharmacy. The company exclaim, 'what fine order prevails here!' The chests, the bottles, all well arranged like soldiers in a parade. That was pleasant to see. The Marshal loaded me with compliments. 'I was,' he said, 'the benefactor of the circle; an illustrious proprietor. This establishment did the greatest honour to the whole government,' &c. As for me—I bow, I thank, I say to myself, 'stay, my friend; thou shalt see quite another thing when thou comest to the halls of the sick.' We come. The corridor is clean and clear. There is nothing to say. '*First Class, Chronic Complaints*,' cries the Doctor. '*Hall No. 1. Dropsical*.' I open the door; I cast my eyes upon the bed; I see—I see—I see the dry, consumptive Andrews. I hasten to get out, and arrive at the other door. The Marshal himself reads the inscription. '*Hall No. 2. The Consumptive*.' Every one follows me, and—I thought, in fact, that the earth would have opened under me. Lord God!—the fat Sacristan!" "Hast thou been a long time consumptive?" enquired the Marshal, smiling. "About two years, my lord," replied the Sacristan. "One might have judged so," said

the idiot Burkin ; ' thou hast a very suffering look, poor devil ! ' ' Suffering ! he has a belly like a hog's head.'

" The Marshal could not resist it, all the company burst out into laughter ; and as for me, I did not know how to escape ; for I have no remembrance of what has since happened, till the moment I met you."

" But what great evil is there in all that, brother ?"

" Couldst thou ask such a question ! and how could you expect me to reappear in the world after such an adventure as that ? If it were discovered"—

" Eh ! my friend, how can they ever imagine that thou hirest thy patients at so much per day ? They have misplaced the labels, that's all."

" You think, then, that I might say—"

" Certainly ; nothing more simple than one label put up for another by a servant. But I see the party approaching ; go before them. Explain the error which has been committed, and, in order that they may cease to laugh, laugh you louder than any of them."

A TRIP TO GRAVESEND.

MR. EDITOR,—There are few sights which create so much pleasure in the minds of those persons who sympathize with the oppressed and over-worked producers of this metropolis as a Gravesend steam-boat on a fine sunny morning, crowded with persons, the majority of whom seem perfectly to have made up their minds to be happy for one day at least during the summer. It is truly delightful to see the joyous companies rushing on board the vessel with as much eagerness and impetuosity as if London was besieged, and a troop of soldiers were at their heels. To see the young girls, yielding to the irresistible impulse of pleasing change, laughing and skipping about the deck with all that delightful unsuspecting liberty so peculiar to youth when it has not been squeezed and tortured into the cold formalities and insipid deportment of etiquette and gentility as it is called ; which system of education prohibits females from responding to any agreeable events or sensations in a joyful or natural manner, but requires that they should regard all occurrences, serious or humorous, with the prim deportment and indifferent expressions of an Egyptian mummy or an Indian idol. What a delicious change it is to those who are in the habit of being constantly shut up in a workshop, and immured in this Babylon of bricks and mortar, to find themselves coursing down the rippling Thames, gliding before the balmy air, scarcely fresh enough to make the trees nod as you pass by them ; to see yourself surrounded by a host of slow-moving craft, with their milk-white canvass stretched to the very pennant, kissing the soft breeze as it dances through the warm haze in which all the surrounding objects are bathed, occasionally losing sight of the fixed objects on the shore as you ride through a forest of masts ; then emerging again upon an open distance, where looking through the dreamy halo of golden mist, you may detect the huge vessel, diminished to a speck ! Then how charming to reflect, that the moving objects in this noble panorama, laden with richest stores from the various harvests of the earth, are all the triumphs of science, and the productions of the human intellect ! When we look back upon the small amount of nautical knowledge that was possessed by the ancients, even when they had approached the apex of civilization, as it was thought, and compare it with the moral incapacities of the nineteenth century, it almost tempts us to believe in the perfectibility of man. It is a very com-

mon thing to hear persons complain that, while the objects below bridge are black, monotonous, and dull, every thing above Westminster is decidedly superior. The truth is, the qualities of each are very different ; they are both highly interesting. Few persons are more alive to the enchanting influence of soft sylvan scenery than myself ; I love to see the glassy river winding through the level plain of grassy sward, till sloping hills, the crystal river, and the sunny sky unite, and, melting into distance, terminate the luscious sight. But while the enraptured eye drinks in these lovely scenes, the mind is made to retrograde by the stationary certainty and sameness of the objects that surround it. If your ear is delighted by the music of the lark, as she bursts from the green wheat, soaring upwards on her golden wings, making heaven echo with her warblings, from all the facts in our possession, her lovely song is much the same it ever has been. If you taste the fragrant odours of the new-mown hay, or hear the mighty ocean sporting with the winding shore, you infer that they have undergone but trifling changes. Not so, when you view the floating castles on the breast of the Thames. What thoughts occur to the mind at the sight of a steam-boat in motion, battling all impediments and conquering the very elements themselves, as proudly she lords it over wind and tide, making all the small craft dance for joy as her majestic form swells the silvery liquid ! If the Romans boasted that they had conquered the world, how ought we to boast who have conquered the very elements ! But to whom are we indebted for the comparative perfection of the modern steam-boat ? Is it to some mighty monarch of the earth, surrounded by the empty pageants and glitterings of a court, accompanied by the servile gestures and the bended knee ?—No !—Is it the production of some profound dignitary, bred within the walls of some far-famed college ?—No !—It emanated from one of the humble classes, JAMES WATT, honour to his name ! A proof at once, that whatever artificial distinctions man may make with tinsel baubles and unmeaning titles, nature knows them not, but seems to ridicule them by raising men of the brightest talents from the common stock ; and when the arts and sciences shall have diffused their blessings more among the people, when genuine education and happiness shall have refreshed the earth, like milky showers that feed the tender buds, then all things will be viewed from a proper point of sight, and every thing well tried by the test of UTILITY. Then the names that have stood in the brightest niches of the Temple of Fame, will mingle with the waters of *Lethé* : the Alexanders, the Cæsars, the Pompeys, and the Napoleons, will find their proper level, and only be remembered as mistaken persecutors of the human family ; while the name of Watt must live through all time, because it is honourably united with a principle that can never be lost ; far above all heroes and conquerors is he ; the efforts of his mighty genius are not for the benefit of any petty locality, they will embrace and enrich the whole world.

These reflections grew out of a voyage to Gravesend, one of the happiest days I ever spent. The morning was splendid, and every person seemed alive to the influence of sun and sky ; not a frown was to be seen, nor a sigh to be heard, as we dashed by the variegated hills and the pretty little ferry-houses : one object I shall never forget, the last we saw ; it was a view of that noble fabric, St. Paul's Cathedral, seen through an arcade of shipping with their masts and spars, all illumined by the glowing fires of the golden west.

Sept. 1.

ONE OF THE UNWASHED.

EXTRAORDINARY GROWTH.

A BOY of the hamlet of Bouzanquet, in the diocese of Alais, now the department of Gard, situated at the foot of the Cevennes, though of a strong constitution, appeared to be knit and stiff in his joints till he was about four years and a half old. During this time nothing further was remarkable in him than an extraordinary appetite, which was satisfied no otherwise than by giving him plenty of the common food of the inhabitants of the country, consisting of rye-bread, chestnuts, bacon, and water; but his limbs soon became supple and pliable, and his body beginning to expand itself, he grew up in so extraordinary a manner, that at the age of five years he measured four feet three inches; some months after he was four feet eleven inches; and at six he was five feet, and bulky in proportion. His growth was so rapid, that we might fancy we saw him grow; every month his clothes were required to be made longer and wider; and, what was still more extraordinary in his growth, it was not preceded by any sickness, nor accompanied (as is usual) with any pain. At the age of five years his voice changed, his beard began to appear, and at six he had as much as a man of thirty; in short, all the unquestionable marks of puberty were visible in him.

It was believed in the country that this child, at the age of five or five years and a half, had attained virility, which induced his mother to keep him from too familiar a conversation with children of the other sex. Though his wit was riper than is commonly observable at the age of five or six years, yet its progress was not in proportion to that of his body. His air and manner still retaining something childish, though by his thickness and stature he resembled a complete man, which at first sight produced a singular contrast. His voice was strong and manly, and his great strength rendered him already fit for the labours of the country. At the age of five he could carry to a great distance three measures, weighing 84lbs.; when turned of six he could lift up easily on his shoulders, and carry loads of 150lbs. to a considerable distance; and these exercises were exhibited by him as often as the curious solicited him by any present. Such beginnings made people think that he would soon shoot up into a giant. A mountebank was already soliciting his parents for him, flattering them with hopes of putting him in a way of making a great fortune. But all these fond ideas soon vanished; his legs became crooked, his body shrunk, his strength diminished, his voice grew insensibly weaker, and he at last sunk into total imbecility.

HABITS OF SPIDERS.

M. Walcknaër related before the Entomological Society of France, the following curious fact, which is given on the authority of Mr. Spence. Having placed a large full-grown spider, of the species *Epeira diadema*, on a cane planted upright in the midst of a stream of water, he saw it descend the cane several times, and remount when it had arrived at the surface of the water. Suddenly he altogether lost sight of it, but a few moments afterwards, to his great astonishment, perceived it quietly pursuing his way on the other side of the stream. The *Epeira* having spun two threads along the cane, had cut

one of them, which, carried by the wind, had become attached to some object on the bank, and so served the spider as a bridge across the water. Mr. Spence believes that spiders, when adult, always use similar means to cross water. M. le Pelletier de Saint-Fargeau supported the opinion.—*L'Institut*.

CRITIQUE UPON NATURE.

Dr. Morgan, in his "Philosophy of Life," says that "the great toe seems to be an abortive attempt of Nature at making a thumb!" Query, Would the great toe have been more perfect had she succeeded in her attempt, and made a thumb of it? We once heard a physician say the same of a horse's hoof, that it was an abortive attempt at making a hand, and, as a proof of it, he said we might easily perceive the model of the five fingers in dissecting the hoof. It is strange that she has never succeeded in bringing them out. If she should ultimately succeed, and make a hand of the hoof, what a vast improvement it would make in the animal's shape! We wish her God speed, and hope in the mean while that she will carefully study Dr. Morgan's "Philosophy of Life:" she will find some useful matter in the work.—N.B. She has succeeded much better with monkeys' great toes than ours; for she has made thumbs of them all.

THE IGNORANCE OF WISDOM.

VEGETABLES and zoöphytes (or the lowest order of animals) are subject to few diseases, and those mostly the results of accidental violence; while the higher orders of animals become subjected to malady in proportion as the character of their animality is exalted, and the physical more subjected to the moral being. The sensual gratification of appetite is usually characterized as brutal, a most unjust libel on the subject of comparison. Inordinate gratifications of sense are the fatal prerogatives of reason, and the further an animal is removed from the human organization, the purer are its habits and the more healthy its life.—*Sir T. C. Morgan*.

COLLEGE DIVINITY.

At a late catechetical examination in Trinity College, Dublin, an examiner, well known for his delight in badgering blockheads, enjoyed the following treat:—Q. It is recorded in Scripture that a beast spoke,—what was the beast?—A. A whale. Q. To whom did the whale speak?—A. To Moses in the bulrushes. Q. What did the whale say?—A. Almost thou persuadest me to be a Christian. Q. And what did Moses reply?—A. Thou art the man.

TO CORRESPONDENTS.

The verses on the death of a Young Lady are very beautiful; but as we had something of the same nature in our last, we withhold them merely for the sake of variety. The story of fair Anné is more general in its application—and consequently more suitable.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sildbury, Worcester; Bready, Sheffield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 3.]

SATURDAY, SEPTEMBER 13, 1834.

[Price 1d.]

SYSTEM OF NATURE.

IN our two first numbers we have pointed out the unity, the duality, and the trinity of Nature—and what have we made of them? Very little, if any thing; only we have demonstrated that she acts universally in these three capacities. We are not, however, to infer from this that the other numbers, from one to infinity, are not equally characteristic of nature. For what is there, or what can there be, which is not characteristic of nature? but some features or peculiarities are more general than others; and those to which we have alluded are of a general character, and may be called *primary*; leading directly to, or forming the foundation of, first principles.

Perfect unity is motionless, because it is solitude: there is nothing to cause excitement and lead to action. In order to create motion, there must be two powers; the one must excite, and the other must be excited. Their natures are opposite, but to this opposition they owe all their energy. Thus, the magnet attracts, the needle is attracted. The lover woos his mistress; the mistress yields to his caresses.

But the union or collision of two is necessarily connected with a third—the effect produced. Thus when carbonate of soda is dissolved in one tumbler, and tartaric acid in another, these are two powers at rest; the one is an acid, the other is an alkali—the acid being supposed by chemists to be generally produced by an excess of oxygen—the alkali by hydrogen. Pour the contents of one of these tumblers into the other, and instantly a keen fermentation is produced, and the product of the two agents is what we call soda water. Now, one half of the metaphysical world of Christendom and Heathendom is, or has been, at variance with the other half, upon a subject which is beautifully illustrated, and rendered quite as intelligible as any thing in nature can be, by this simple process. The Unitarian and Trinitarian controversy resolves itself finally into a philosophical question, and both are true—Nature at rest is unity; Nature in action is a trinity.

This splendid philosophical question, however, is not yet begun to be discussed. What has been said and what has been written upon the subject by those who call themselves by these opposite names, has only been the infantine development of a truth, which will yet be embraced by all the future discoveries of science. It has been the embryo of a great scientific question, which the ignorance of mankind has confined to the analysis of the person of a finite individual, instead of extending it as they ought to the illimitable existence of the universe. But what has

been done in this controversy has been of great ultimate benefit. The attempt to establish an erroneous doctrine is always useful. It cannot succeed. There is sufficient resistance in nature to shake it whilst its power lasts; and the discrepancies, inconsistencies, and discontent which it creates, at last unveil the minds of its abettors, and dispel the visions of unenlightened fancy. They know then the evil of building upon fundamental errors, and the value of truth is more highly appreciated. Hence it seems to be a law of nature, in the moral as well as the physical world, that as the fruit is hurtful, or even poisonous to the stomach before it is matured, though containing the elements of its future virtues; so, in the intellectual growth of most important elementary truths, the early stages are characterized by evils of an exceedingly noxious nature, gradually declining in virulence, and increasing in salubrity as puberty approaches. But as children are fond of plucking and eating the fruit before it is ripe, so men, in the infancy of society, the gloom of intellectual midnight, before the sun of righteousness has arisen, have mistaken error for truth, eggs for chickens, and types for substances; they have eaten sour grapes, so that their teeth are set on edge, and their bellies are bitter.

We do not know which of the two parties to which we have above alluded has acted the most childish and foolish part; but this we know, that neither had, or yet has, the slightest idea of the truth and sublimity of the subject of controversy. When once they have got a glimpse of it, the truth is too simple ever to be disputed, and so extremely accommodating as to embrace and reconcile the peculiar notions of both. We can only hope that the time is not far distant when the minds of men shall be emancipated from the petty sectarian dungeons in which they have been vainly groping for the sunshine of heaven, that they will burst the bonds of mental and spiritual oppression—which now gall the limbs of the most enlightened, and the most liberal of all sects, both religious and antireligious, and study Nature and all her contents without fear or prepossession.

It is melancholy to see the most enlightened and civilized of the present age—men who have measured the heavens and weighed the air, and removed the veil from many of the mysteries of Nature; who aim at the conversion of foreign nations, and disperse in a hundred different tongues the records of their own faith, and prophetic glimpses of a world to come, to remove the ignorance and cure the dissensions of other lands—themselves engaged in the most vague and childish disputations, which even a Calmuc Tartar has sufficient sagacity and knowledge of nature to determine. But they who assume

the right of instructing others, require themselves to be taught. They have all departed from nature; been drilled by parental instruction, and the dunning of priestly importunity, into an artificial philosophy, to which the power of public opinion still keeps them enslaved, long after it has lost its moral power, and ceased to be a light unto their feet, and a lamp unto their path.

But obstinacy on one side invariably raises up the opposite spirit of obstinacy on the other. The spirit of resistance is easily excited; you have nothing to do but to be very bold, very positive, and very confident, and you are sure to kindle a flame of boldness, positiveness, and confidence in some other party equal to your own. It is a law of nature, preserving order, and checking the immoderate ardour or absurdity of one party, by the equally immoderate ardour and absurdity of another. It is the alkali and the acid in collision, of which the consequence is what is vulgarly called a "flare-up," and then everlasting repose in the neutralization or subjection of both parties which follows. Thus, the absurdities which men have taught respecting the character of Deity, and the monstrous inconsistencies and cruelties into which they have led them, have caused a revival in these latter days of the old Epicurean doctrine of the promiscuous concourse of atoms, as a negative wherewith to assail the dogmatical affirmative of the schools; and now the two parties range themselves against each other in mutual hostility, equally confident of success; but another doctrine, resulting from the union of the two, is yet in the womb of thought, and will neutralize them both. The analogy of nature, and the inconclusiveness of the reasoning of both parties, might have taught them so long ago; but if one party should prove to be obstinate, another must be found equally obstinate to keep it in order; and the more opposed the two parties at first are, the better for the final elicitation of truth: it kindles the zeal and rouses the genius—collects materials for argument and illustration—and enables them who come in at the consummation to decide with clearness and judgment. One generation is a pioneer for another; it removes the stones, and breaks the clods on the same soil, on which one generation shall sow the seed, and another reap the fruit. The growth is everlasting, and the progress foresees no termination—happiness is in store for the species—and if the prospect for individuals were equally bright, our joy would be complete. For what is the species? Nothing at all. It has no consciousness, no memory, no perception. The individual alone is anything—the species is an abstraction.

But let us go boldly on, and fight the battles of opinion. Truth knows no fear; error alone is timorous. It subdues by force—it withholds—it insists. Why? Because it cannot confute. The lies are numerous which each party tells in its own defence; and the zeal with which these lies are abetted for the sake of effect, is revolting to an honest mind: on which account the best and the most enlightened of our fellow men have retired from controversy. But if all were to follow their example, it would stagnate the mind of the species for ever. We must continue to strive until a general coalescence takes place, and make war with error that we may be at peace with truth.

THE SHEPHERD.

JOSEPH WOLFF.

IN every age of the world, individuals arise of a singular organization for prosecuting benevolent designs, which to the rest of mankind appear impracticable to human perseverance, or attended with personal inconveniences and sacrifices, which are worse than death itself. But as hunger is the best of sauces to the stomach, so enthusiasm, or entire absorption of thought, makes ample compensation for all the sufferings and privations which we experience in the prosecution of a favourite object. How few men could be found in one single generation, prepared to encounter such hardships as those to which Mungo Park, Laing, the Landers, and others, have voluntarily submitted, all for the sake of benefiting science, or securing to themselves the honest reputation of having accomplished an arduous and a useful task! The love of approbation we believe is the strongest motive which stimulates them to action; but in how very few is that passion so powerfully excited, and so usefully!

But religion seems yet to be the greatest field of enthusiasm and self-sacrifices, as well as the arena of burning strife for worldly preferences, rich endowments, and pampering luxuries. The contrast is singular, but the devotion and self-denial of a Christian missionary is not more remarkable than the idleness, the hypocrisy, and impiety of a clerical hierarch and sinecurist are outrageous.

Joseph Wolff is, perhaps, the most distinguished missionary of the day. He is a Jew by birth, the son of a Rabbi, became a convert to Christianity in early youth, was educated at Rome under the eye of the Pope, questioned his supremacy, his divinity, and the divinity of the Holy Virgin; was obliged to decamp, and at last found his way to Protestantism and England, the land of heresy. Wolff is a man of rare talent and moral courage, an excellent Oriental scholar, who has preached in one day in six different languages to the natives of Syria; and is therefore eminently qualified, by nature and education, for a mission to the East. His whole soul is engulphed in the single desire of converting his infidel brethren of the house of Israel; and since the year 1822 he has been almost constantly engaged in that arduous work, travelling about in the land of the sun, with chests packed with the Bible Society's Oriental translations of the Scriptures, and a head well stored with the literature of the East. Of his success we can say but little; but there can be no doubt that he has converted many of his eastern brethren, and distributed many thousands of Syriac Bibles amongst men of education, who never before had such a book in their possession. Mr. Way's description of him is very remarkable. "A man who at Rome calls the Pope 'the dust of the earth,' and tells the Jews at Jerusalem 'their Gemara is a lie;' who passes his days in disputation and his nights in digging the Talmud; to whom a floor of brick is a feather bed, and a box a bolster; who makes or finds a friend alike in the persecutor of his former or present faith; who can conciliate a pacha or confute a patriarch; who travels without money or a guide, speaks without an interpreter, lives on any food, forgives any insult, forgets every flattery; who knows

little of worldly conduct, and yet accommodates himself to all men without offending any; such a man must excite great attention in a people whose monotony of manners have been undisturbed for centuries. As a pioneer he is matchless, whether he has to find or make his way; but if order is to be established, or arrangements made, trouble not Wolff! He knows no church but his heart, no calling but his duty, no dispensation but that of preaching, &c. By such an instrument, whom no college could hold, whom no school has taught, is the way of the Judean wilderness preparing." This is, no doubt, overcharged, and written for effect; but still Wolff is a wonderful character—treading in the footsteps of Martyn and Brainerd—possessing the same spirit, equal, if not greater talents than Martyn, a better constitution and better luck. Many will be apt to enquire what good such a man can do—is he not perpetuating the reign of strife, and supplanting one unintelligible dogma of unenlightened mysticism by another equally unintelligible and noxious in its moral effects? We answer, no apparent good; but all such characters are useful members of society; he is opening up a communication between the East and the West, the good effects of which will hereafter be experienced. In a country such as this, his services are not required. He is an enthusiast. The spiritual zeal of European population is now being tempered by the moderation of science, and the success of his preaching in a land like England would be a retrograde step. But not so in the East. There he meets with a population, who are far behind with respect to general information, whose religious enthusiasm presents a suitable counterpart to his own, and to whom any free correspondence with the western world must ultimately convey beneficial information, and prepare them for reciprocal acts of kindness and social intercourse. Moreover, to deprive him of his religious enthusiasm would be to deprive him of his fitness for the task he has engaged in; where then could he find his zeal? He is independent, and can live in affluence at home.

But whatever good may result from such missions ultimately, no immediate good would result from the conversion of those Orientalists to such opinions as those of Wolff—who is an exclusive Christian of the old school. He has been treated with more lenity than a Mahometan missionary would be treated by the Christians. Mahometan princes have received his books, and patronized him in the establishment of schools: what Christian would do so for a learned Mahometan? But at Constantinople many have suffered severe persecution for professing his principles; Jews offer large bribes to the judges to put the apostates to death. But when we read the following little anecdote, so characteristic of the high sense of honour which prevails in the East, we wonder what other religion now taught amongst men could substitute a better spirit for the one it seeks to destroy; it is very short:

"A peasant of Bethlehem besought me to give him Arabic Psalters and Gospels. When I told him my trunks were not arrived from Damietta, he desired me to receive his money, that I might not forget to send the books."

This needs no comment—this man would not have been so simple and unsuspecting if he had been reared amid the knavery and dishonesty of Christendom. We shall close with the following characteristic interview with a Yezedi, who somewhat puzzled in argument the son of Jacob.

Interview with a Yezedi.

Asking if he was a Kurd, the man replied, "I am a Yezedi of the order of Danadia."—W. What is your belief? Y. We never do so (lifting his hands toward heaven and bowing his knees).—W. Do you sometimes think of God? Y. Never.—Having heard that they worshipped the devil, Wolff asked him. Y. We worship nothing; never mention him you have just named, and we love him whom you have named.—W. Do you believe the devil is good? Y. No.—W. Why love him, then? Y. Thus it is.—W. Do you believe the existence of a God? Y. We believe.—W. Why not pray to him, then? Y. Thus it is.—W. If I gave you a present, would you thank me? Y. I would give you many thanks for a present.—W. God gives you life, breath, clothes, raiment; his sun shines over you; why do you not thank him? Thus it is.—W. Do you not know how to read? Y. None of us.—W. Have you any priests? Y. No.—"Khalil Agha, a murderer, is their chief," says Wolff; "they live in tents; are numerous. I left that horrid professor of the devil, and tried to pray for him. The Yezedi never prays! never lifts up his hands to heaven! never bows down! 'Thus it is!'"

There are many Yezedis in England, whose knees are so stiff, that all the eloquence, learning, and magisterial power of the church could not bend them. Thus it is.

THE WANDERER.

BEHOLD that young traveller—how slowly he moves,

How dejected he seems, and forlorn!

Alas! he is wandering from all that he loves,

From the sunshine, to buffet the storm.

Let us pity his follies, and blame him not so;

Poor fellow! he suffers when none of us know.

Oh, heed not so much what the rigid ones say,

For they sometimes too quickly condemn;

'Twas their harsh upbraidings that drove him away

From the friends he may ne'er see again;

They censured his follies and made him do so;

Poor fellow! he suffers when none of them know.

Could they notice his heart beat, or hear his soft prayers;

Could they mark when he stifles a sigh;

Did they know how he struggles to lighten his cares,

Or behold the moist drop in his eye;

They would pity his follies and blame him not so;

Poor fellow! he suffers when none of them know.

Nor say that affection has fled from his breast,

Though away from them all he may roam;

For deep in his bosom she takes up her rest,

And often reminds him of home.

Then pity his follies and blame him not so;

Poor fellow! he suffers when none of us know.

Sad would the tale be his tongue could reveal,

Which his pride shall for ever suppress;

'Tis enough that his sorrows have taught him to feel

How the world treats a man in distress.

So, pity his follies and blame him not so;

Poor fellow! he suffers when none of us know.

DESTRUCTION AND CREATION.

TO THE EDITOR OF THE SHEPHERD.

THESE two words are used every day, but are almost always misunderstood. What is commonly called destruction, is nothing more than a change of form arising from a new arrangement of parts. Destruction, in the common acceptation of the term, is a something that never occurs in Nature. Man cannot destroy the smallest particle of matter, although he frequently assumes to himself the possession of such power in the ordinary forms of colloquial speech. Thus, when a sheet of paper is brought in contact with flame, it *burns away*, leaving almost nothing behind; the vulgar say is it destroyed; and in like manner the coal we employ it destroyed, the gas destroyed, the oil destroyed; but philosophically and in reality not a single atom of matter has been annihilated; change of form and change of composition have certainly occurred, but no destruction of matter has taken place.

Many other processes appear to favour the erroneous supposition of destruction. If we expose chalk to a high temperature, it very speedily decreases in weight,—a circumstance that is immediately explained by the chemical philosopher, who knows very well that chalk is composed of two ingredients, lime and carbonic acid, united or bound together by the power of attraction, and that heat dissolves the connexion between the two, compelling the carbonic acid to assume the aerial form and fly away. That this is the true explanation, and that there is no absolute destruction of matter, we may learn from actual experiment; for by collecting the carbonic acid as it is thrown off, we find that it is exactly equal in weight to the loss of weight sustained by the chalk; and finally, if we add the carbonic acid thus collected to the lime from which it was driven, the two bodies immediately reunite and regenerate the original compound chalk, without alteration of weight, or any other essential particular.

In like manner may be easily explained other apparently more complicated processes; as for example, the combustion of wood, coal, and other inflammable materials. These bodies are of a compound nature, consisting of several simple elements united together in a certain order and proportion. This order and proportion are disturbed by the conjoined influence of heat and air; a revolution among the elements is established, new unions are formed, new substances are generated, and these being mostly gaseous, rise into the air and escape from vulgar observation.

If we proceed as before, and collect the products of our experiment, the aerial and solid substances that are formed, and submit them to the test of the balance, no diminution of weight can be detected, but, on the contrary, a considerable increase of weight is observable. How is this? Have we created matter? Certainly not. Man cannot create a single grain. In many of our operations we appear to create matter, the substances we employ very frequently increase in weight, but this increase of weight is always derived from some other department of nature, which suffers a corresponding diminution. When mercury is boiled in contact with the air, its weight is augmented, for it combines with oxygen, one of the elements of the air; hence the apparent creation of matter. When combustible bodies are burnt, the same element, oxygen, combines with their most important principles, and of course the weight of the products is greater than that of the original body before it sustained decomposition. To assert, therefore,

that in these and similar instances we have created matter, is almost as absurd as the statement of that sapient individual, who maintained that the world had materially increased in weight, and as a proof alluded to the buildings which have been erected since the beginning, forgetting the woods that have been depopulated, and the mines and quarries that have been exhausted in the completion of those erections.]

In a word, the various processes that are continually going on around us, and that appear instances of creation and destruction, are nothing more than new arrangements of the particles of matter. These new arrangements are in many cases under the control of man; but to destroy or to create exceeds the limits of any finite power.

R. J.

P. S. I intended to have made a few remarks on the destruction of organic beings, but was afraid of being too tedious. You shall have them next week, if you think the above worthy of insertion.

TERMITES, OR WHITE ANTS OF AFRICA.

THE white ants of Africa are the most formidable and intelligent of the species; their hills, or communities, are large and spacious buildings of mud, rising nine, ten, and a dozen feet in height. These buildings consist in the interior of innumerable cells, pipes, or avenues, halls, and bridges, which, considering the size of the animal, render them much more huge and commodious buildings than are ever constructed by human beings. The termites arborum, or tree ants, build their nests on the tops of large trees, sometimes seventy or eighty feet from the ground; the nest itself is quite as large as a hog's-head, and so compact, strong, and firmly attached to the tree that no wind or storm can destroy it without at the same time breaking the branch on which it is supported. The following is Mr. Smeathman's account of these industrious creatures:—

"There are of every species of termites three orders. Of these the working insects or labourers are always the most numerous. In the termites bellicosus there seem to be at least one hundred labourers to one of the fighting insects or soldiers. The labourers are about one-fourth of an inch long, and twenty-five of them weigh about a grain; so that they are not so large as some of our ants. From their external habit and fondness for wood, they have been very expressively called 'wood-lice.' They resemble them, it is true, very much at a distance, but they run faster than any other insects of their size, and are incessantly bustling about their affairs.

"The second order, or soldiers, have a very different form from the labourers, and have been by some authors supposed to be the males, and the former neuters: but they are, in fact, the same insects as the foregoing, only they have undergone a change of form, and approach one degree nearer to the perfect state. They are now much larger, being half an inch long, and equal in bulk to fifteen of the labourers.

"There is now likewise a most remarkable circumstance in the form of the head and mouth; for in the former state the mouth is evidently calculated for gnawing and holding bodies; but in this state, the jaws being shaped just like two very sharp awls a little jagged, they are incapable of any thing but piercing or wounding, for which purposes they are very effectual, being as hard as a crab's claw, and placed in a strong horny head, which is of a nut-brown colour, and larger than all the rest of

the body together, which seems to labour under great difficulty in carrying it: on which account perhaps the animal is incapable of climbing up perpendicular surfaces.

The third order, or the insect in its perfect state, varies its form still more than ever. The head, thorax, and abdomen, differ almost entirely from the same parts in the labourers and soldiers; and, beside this, the animal is now furnished with four large brownish, transparent wings, with which it is at the time of emigration to wing its way in search of a new settlement. In short, it differs so much from its form and appearance in the other two states, that it has never been supposed to be the same animal, but by those who have seen it in the same nests; and some of these have distrusted the evidence of their senses. It was so long before I met with them in their nests myself, that I doubted the information that was given me by the natives, that they belonged to the same family. Indeed we may open twenty nests without finding one winged one, for these are to be found only just before the commencement of the rainy season, when they undergo the last change, which is preparative to their colonization.

In the winged state they have also much altered their size as well as form. Their bodies now measure between six and seven-tenths of an inch in length, and their wings above two inches and a half from tip to tip, and they are equal in bulk to about thirty labourers, or two soldiers; they are now also furnished with two large eyes placed on each side of the head, and very conspicuous. If they have any before, they are not easily to be distinguished. Probably in the two first states, their eyes, if they have any, may be small like those of moles; for, as they live like these animals always under ground, they have as little occasion for these organs, and it is not to be wondered at that we do not discover them; but the case is much altered when they arrive at the winged state in which they are to roam, though but for a few hours, through the wide air, and explore new and distant regions. In this form the animal comes abroad during or soon after the first tornado, which at the latter end of the dry season proclaims the approach of the ensuing rains, and seldom waits for a second or third shower, if the first, as is generally the case, happens in the night, and brings much wet after it. The quantities that are to be found the next morning all over the surface of the earth, but particularly on the waters, is astonishing; for their wings are only calculated to carry them a few hours, and after the rising of the sun not one in a thousand is to be found with four wings, unless the morning continues rainy, when here and there a solitary being is seen winging its way from one place to another, as if solicitous only to avoid its numerous enemies, particularly various species of ants which are hunting on every spray, on every leaf, and in every possible place, for this unhappy race, of which probably not a pair in many millions get into a place of safety, fulfil the first law of nature, and lay the foundation of a new community.

"Not only all kinds of ants, birds, and carnivorous reptiles, as well as insects, are upon the hunt for them, but the inhabitants of many countries, and particularly of that part of Africa where I was, eat them. At the time of swarming, or rather of emigration, they fall into the neighbouring waters, when the Africans skim them off with calabashes, bring large kettles full of them to their habitations, and parch them in iron pots over a gentle fire, stirring them about as is usually done in roasting coffee. In that state, without sauce or any other addition, they serve them as delicious food; and

they put them by handsfull into their mouths, as we do comfits. I have eaten them dressed this way several times, and think them both delicate, nourishing, and wholesome; they are something sweeter, but not so fat and cloying, as the caterpillar or maggot of the palm-tree, snout-beetle, *curculio palmarum*, which is served up at all the luxurious tables of West-Indian epicures, particularly of the French, as the greatest dainty of the western world."

These winged aristocrats are now of no more use in the economy of nature, except for procreation; but as one male and one female are sufficient for a nest, the labourers, or first year's ants, seize upon an unresisting pair, who are so fortunate as to come within their reach at the proper season, and drag them away to a place of security, where they immediately build an apartment for them, and raise a splendid superstructure of private cells around it. By and by the queen increases to an enormous size, being twenty or thirty thousand times, according to Mr. Smeathman, the size of a common labourer. This size is occasioned by a dilatation of the abdomen, which protrudes eggs, to the amount of sixty in a minute, or eighty thousand and upwards in twenty-four hours. These eggs are instantly taken up by the attendants, carried to the nurseries, and hatched; after which the young are carefully reared and provided with every thing necessary, until they can take a share in the labours of the community.

"The first object of admiration which strikes one upon opening the hills or nests of the termites, is the behaviour of the soldiers. If you make a breach in a slight part of the building, and do it quickly with a strong hoe or pick-axe, in the space of a few seconds a soldier will run out and walk about the breach, as if to see whether the enemy is gone, or to examine what is the cause of the attack. He will sometimes go in again, as if to give the alarm: but most frequently, in a short time, is followed by two or three others, who run as fast as they can, straggling after one another, and are soon followed by a large body, who rush out as fast as the breach will permit them; and so they proceed, their number increasing, as long as any one continues battering their building. It is not easy to describe the rage and fury they show. In their hurry, they frequently miss their hold, and tumble down the sides of the hill, but recover themselves as quickly as possible; and being blind, bite every thing they run against, and thus make a crackling noise, while some of them beat repeatedly with their forceps upon the building, and make a small vibrating noise, something shriller and quicker than the ticking of a watch. I could distinguish this noise at three or four feet distance, and it continued for a minute at a time, with short intervals. While the attack proceeds they are in the most violent agitation. If they get hold of any one, they will in an instant let out blood enough to weigh against their whole body; and if it is the leg they wound, you will see the stain upon the stocking extend an inch in width. They make their hooked jaws meet at the first stroke, and never quit their hold, but suffer themselves to be pulled away leg by leg, and piece after piece, without the least attempt to escape. On the other hand, keep out of their way, and give them no interruption, and they will in less than half an hour retire into the nest, as if they supposed the wonderful monster that damaged their castle to be gone beyond their reach. Before they are all got in, you will

see the labourers in motion, and hastening in various directions towards the breach; every one with a burden of mortar in his mouth ready tempered. This they stick upon the breach as fast as they come up, and do it with so much despatch and facility, that although there are thousands, and I may say millions, of them, they never stop or embarrass one another; and you are most agreeably deceived when, after an apparent scene of hurry and confusion, a regular wall arises, gradually filling up the chasm. While they are thus employed, almost all the soldiers are retired quite out of sight, except here and there one, who saunters about among six hundred or a thousand of the labourers, but never touches the mortar either to lift or carry it. One in particular places himself close to the wall they are building. This soldier will turn himself leisurely on all sides, and every now and then, at intervals of a minute or two, lift up his head, and with his forceps beat upon the building, and make the vibration noise before-mentioned; on which immediately a loud hiss, which appears to come from all the labourers, issues from within-side the dome and all the subterraneous caverns and passages. That it does come from the labourers is very evident, for you will see them all hasten at every such signal, redouble their pace, and work as fast again.

"As the most interesting experiments become dull by repetition, so the uniformity with which this business is carried on, though so very wonderful, at last satiates the mind. A renewal of the attack, however, instantly changes the scene, and gratifies our curiosity still more. At every stroke we hear a loud hiss; and, on the first, the labourers run into the many pipes and galleries with which the building is perforated, which they do so quickly that they seem to vanish, for in a few seconds all are gone, and the soldiers rush out as numerous and as vindictive as before. On finding no enemy, they return again leisurely into the hill, and very soon after the labourers appear loaded as at first, as active and as sedulous, with soldiers here and there among them, who act just in the same manner, one or other of them giving the signal to hasten the business.

"We met vast obstacles in examining the interior parts of these tumuli. In the first place, the works, for instance, the apartments which surround the royal chamber and the nurseries, and indeed the whole interior fabric, are moist, and consequently the clay is very brittle: they have also so close a connexion, that they can only be seen, as it were, by piece-meals: for having a kind of geometrical dependance or abutment against each other, the breaking of one arch pulls down two or three. To these obstacles must be added the obstinacy of the soldiers, who fight to the very last, disputing every inch of ground so well as often to drive away the negroes who are without shoes, and make white people bleed plentifully through their stockings. Neither can we let a building stand so as to get a view of the interior parts without interruption, for while the soldiers are defending the out-works, the labourers keep barricading all the way against us, stopping up the different galleries and passages which lead to the various apartments, particularly the royal chamber, all the entrances to which they fill up so artfully as not to let it be distinguishable while it remains moist: and externally it has no other appearance than that of a shapeless lump of clay. It is, however, easily found from its situation with respect to the other parts of the building, and by the crowds of labourers and soldiers which surround it, who show their loyalty and fidelity by dying under its walls. The royal chamber in a large nest is capacious enough to hold many hundreds of

the attendants, besides the royal pair, and you always find it as full of them as it will hold. These faithful subjects never abandon their charge even in the last distress; for whenever I took out the royal chamber, and, as I often did, preserve it for some time in a large glass bowl, all the attendants continued running in one direction round the king and queen with the utmost solicitude, some of them stopping on every circuit at the head of the latter, as if to give her something. When they came to the extremity of the abdomen, they took the eggs from her, and carried them away, and piled them carefully together in some part of the chamber, or in the bowl, under, or behind any pieces of broken clay which would lie most convenient for the purpose.

"If in your attack on the hill you stop short of the royal chamber, and cut down about half of the building, and leave open some thousands of galleries and chambers, they will be shut up with thin sheets of clay before the next morning. If even the whole is pulled down, and the different buildings are thrown in a confused heap of ruins, provided the king and queen are not destroyed or taken away, every interstice between the ruins, at which either cold or wet can possibly enter, will be so covered as to exclude both, and, if the animals are left undisturbed, in about a year they will raise the building to near its pristine size and grandeur.

"The marching termites are not less curious in their order, as far as I have had an opportunity of observing them, than those described before. This species seems much scarcer than the termites *bellicosus*. I could get no information relative to them from the black people, from which I conjecture they are little known to them. My seeing them was very accidental. One day, having made an excursion with my gun up the river Camerankoes, on my return through the thick forest, whilst I was sauntering very silently in hopes of finding some sport, on a sudden I heard a loud hiss, which, on account of the many serpents in those countries is a most alarming sound. The next step caused a repetition of the noise, which I soon recognised, and was rather surprised, seeing no covered ways or hills. The noise, however, led me a few paces from the path, where, to my great astonishment and pleasure, I saw an army of termites coming out of a hole in the ground, which could not be above four or five inches wide. They came out in vast numbers, moving forward as fast seemingly as it was possible for them to march. In less than a yard from this place they divided into two streams or columns, composed chiefly of the first order, which I call labourers, twelve or fifteen abreast, and crowded as close after one another as sheep in a drove, going straight forward without deviating to the right or left. Among these, here and there, one of the soldiers was to be seen, trudging along with them in the same manner, neither stopping nor turning; and as he carried his enormous large head with apparent difficulty, he put me in mind of a very large ox amidst a flock of sheep. Whilst these were bustling along, a great many soldiers were to be seen spread about on both sides of the two lines of march, some a foot or two distant, standing still or sauntering about as if upon the look-out lest some enemy should suddenly come upon the labourers. But the most extraordinary part of this march was the conduct of some others of the soldiers, who having mounted the plants which grow thinly here and there in the thick shade, had placed themselves upon the points of the leaves, which were elevated ten or fifteen inches above the ground, and hung over the army marching below. Every now and then one or the other of them beat with his forceps upon the leaf, and made the same sort of

ticking noise which I had so frequently observed to be made by the soldier who acts the part of the surveyor or superintendent, when the labourers are at work repairing a breach made in one of the common hills of the termites bellicos. This signal among the marching white ants produced a similar effect; for, whenever it was made, the whole army returned a hiss, and obeyed the signal by increasing their pace with the utmost hurry. The soldiers who had mounted aloft, and gave their signals, sat quite still during these intervals (except making now and then a slight turn of the head) and seemed as solicitous to keep their posts as regular centinels. The two columns of the army joined into one about twelve or fifteen paces from their separation, having in no part been above three yards asunder, and then descended into the earth by two or three holes. They continued marching by me for above an hour that I stood admiring them, and seemed neither to increase or diminish their numbers, the soldiers only excepted, who quitted the line of march, and placed themselves at different distances on each side of the two columns; for they appeared much more numerous before I quitted the spot. Not expecting to see any change in their march, and being pinched for time, the tide being nearly up, and our departure fixed at high water, I quitted the scene with some regret, as the observation of a day or two might have afforded me the opportunity of exploring the reason and necessity of their marching with such expedition, as well as of discovering their chief settlement, which is probably built in the same manner as the large hills before described.

"The economy of nature is wonderfully displayed in a comparative observation on the different species who are calculated to live under ground until they have wings, and this species, which marches in great bodies in open day. The former, in the two first states, that is, of labourers and soldiers, have no eyes that I could ever discover; but when they arrive at the winged or perfect state in which they are to appear abroad, though only for a few hours, and that chiefly in the night, they are furnished with two conspicuous and fine eyes; so the termites viarum, or marching bugga bugs, being intended to walk in the open air and light, are even in the first state furnished with eyes proportionably as fine as those which are given to the winged or perfect insects of the other species."

There are three important features in this history of the ants. First, all are producers before they become superintendents, or what are called soldiers, which is a very unsuitable title; second, each becomes a superintendent in his turn, that is, the office is the reward of age and experience; and third, there is one father and mother for the whole community—they are all brethren. It is a happy nation (for a nest may well be called a nation), in which the greatest order, sobriety, unanimity, and concert prevail.

ECONOMY.

It is a Jewish custom to rend the clothes at the death of a friend; and, therefore, the disciples of Moses very cautiously dress themselves in their worst clothes when any member of the family is at the point of death; so that a Jewish death-bed is a very doleful scene altogether. It is ludicrous to think of Grief hastily unclothing himself, and putting on his worst ware, that he may show his contempt of the garments of the flesh by tearing them to shreds.

DRUNKENNESS.

(From the Parliamentary Report.—Mr. M. Moore's evidence.)

Have you made any observations with respect to the number of persons visiting gin-shops in the course of any given period?—Yes; I adopted a plan a few months ago, in order to ascertain what number of persons went into the leading gin-shops in various parts of London; and I commenced by attending myself, in order to operate as a check upon others. I afterwards employed two men on whose testimony I could depend, and the result of the visits they made to these houses has been of a very appalling character. I selected 14 houses, and perhaps the Committee will see the propriety of my not mentioning their names, but I will furnish them to the chairman. I have made out a tabular account of the number of men, women, and children, who went into each house on each day for one week: there were 142,453 men, 108,593 women, and 18,392 children, making a grand total of 269,438 persons who went into those 14 houses in one week.

Will you have the goodness to deliver in that document?—[The Witness delivered in the same in a tabular form.] This table is a report of the number of men, women, and children, who entered 14 of the principal gin-shops in London and its suburbs; of which there are 2 in Whitechapel; 3 at Mile End; 1 in East Smithfield; 1 in the Borough; 1 in Old Street Road; 2 in Holborn; 1 in Bloomsbury; and 3 in Westminster. From these tabular statements it was shown, that, at the principal gin-shop in Holborn, there entered on the Monday, 2880 men, 1855 women, and 289 children, making a total of 5024 in one single day; and in the whole week, 16,988 persons visited one single house. At the principal gin-shop in Whitechapel, there had entered on the Monday, 3146 men, 2189 women, and 686 children, making a total of 6021 in a single day; and in the course of the week the numbers amounted to 17,603. The grand total for one week, in the 14 houses selected, amounted to 269,438, divided in the following proportions—namely, 142,452 men, 108,593 women, and 18,391 children.

Did you observe any difference between the number of those that went in bringing out liquor with them to be drunk in vessels, or those who went in to drink in the houses?—By far the largest proportion that went in were those who took a glass or more upon the premises; but a large proportion of the children had bottles with them for spirits. Those houses are not so much the regular public-houses, where a great proportion of what is sold is malt liquor, but they are noted principally at gin-shops.

Is not beer generally carried in vessels open at the top?—Yes, in jugs, or pint or quart pots. I beg leave here to state a fact, which will tend to show the character of some of the persons who visit those houses, and the length they will go to obtain their favourite beverage. On one occasion, two men were seen to come out of George-yard, Whitechapel; after talking together at the corner of the gateway, one of those men pulled off his shirt, went into a pawnbroker's and pawned it, and then went into the gin-shop with his companion and spent the money. On another day, there were two men talking in the same neighbourhood, and in that instance one man pulled off his shirt, sold it to the other standing by, and then went into the gin-shop and spent the money.

Do you think that the great facility of obtaining money on pledges of articles of small value is in itself one of the causes of the increase of drunkenness?—I think it is a most material cause among the poor people. To show

the extent of intoxication, I have drawn up a short statement, comparing the number of licensed victuallers in London, with the number of other traders which supply provisions for the public, and which statement, by the permission of the Committee, I will read. There are 1887 bakers; 1479 butchers; 940 cheesemongers; 265 fishmongers; 163 poulterers; 218 dairymen; and 1933 grocers; making a total of 6890 provision shops; and there are in London 3638 licensed victuallers, exclusive of beer-shops.

Does that include the gin-shops?—Yes, they all sell spirits; I have also taken three of the leading trades—the bakers, butchers, and fishmongers, and they amount to 3631; and there are 3638 licensed victuallers; so that there are seven more of the licensed victuallers than there are of those three important trades put together.

* * * There is another fact I beg to mention, showing the extent of drunkenness amongst certain classes. There is a system prevailing in London, which is one of the most discreditable and oppressive that can possibly be imagined, and is not exceeded, perhaps, by colonial slavery itself, and that is amongst a class of persons employed in the coal trade.

There is one class of individuals in the coal-trade called “undertakers,” and another “coal-whippers,” or “coal-heavers.” The coal ships from the north are consigned to the former by the owners, factors, or captains, to “deliver” or unload; and they employ the latter for that purpose, in “gangs” of nine men each; one gang being appointed for each ship. The great evil in this arrangement is, that almost all these “undertakers” are publicans, or connected with publicans; and no coal-heaver, with the exception of a very small number, can be employed but through them.

The understood conditions of employment are, that the men shall spend, in ardent spirits and malt liquor, a considerable portion of their earnings. The “score” at the end of the week always amounts to one-third, and frequently to one-half, and sometimes to more than half, of their wages. A case has lately occurred of one man, who, for weeks together, has not received more than 6s. per week out of about 24s.

In this weekly “score” there are two items of a very oppressive character charged by the publican, viz. “towing” and “bad score,” under each of which is put down from 1s. to 2s. 6d., and for which the coal-heaver never receives one farthing in any shape; the charge being made under the pretence of “treating the captain.”

There are two sets of coal-heavers employed, the “constant” and the “extra men;” and it is a common practice for the former, in consideration of their being constantly employed, to pay the “undertaker” (publican) 2s. 6d. a week for “lodging money,” while they always lodge at home with their families. One qualification is indispensable for being on the list of “constant men,” viz. “hard drinking.” “The hardest drinker is the best man.”

About eighty publicans “on the coast,” from the Tower to Limehouse Hole, are engaged in this trade; some of whom employ four or five gangs each, and after a few years retire from business with a good property.

It should especially be observed that, in the first place, every man is obliged to drink, or, “if he does not, it is put down to his number; and if he still refuses, even after he has begun a job, he is immediately turned off through the ‘foreman’ or ‘basket man,’ who puts another man in his place.” A glaring instance of this kind lately took place. One man, disgusted with the practice, did not call at the publican’s on the third morning with the

rest of the gang to take his share of raw rum, as usual, at six o’clock, before he went on board to work, and consequently, during the same day, he was removed from the gang, and replaced by a well-known drinker, who had called that morning upon the publican for a job. Secondly, no man dares object to, or dispute his score, at the end of the week or job, as put down by the publican, on pain of being dismissed the house, and his name sent round to the other public-houses not to be employed.

The consequences of this system to the poor men and their families are truly distressing. It interferes with the liberty of the subject, and destroys the independence and respectability of the men. The taking of so much deleterious drink early breaks down the constitution, and, to use the expressive language of one of themselves, “the men die off like rotten sheep.” The habit and consequences of spending all their evenings in the public-house prevent all social happiness, and produce to a fearful extent, abject poverty, with family demoralization and discord, and the total neglect of the education and moral culture of their children: the deluded wives often claiming a share in the sensual gratifications of their degraded husbands.

A MYSTERY UNVEILED.

“AFTER looking through green spectacles for some time, white paper appears red; and after looking through red spectacles, white paper appears green.”—There are only three original colours in nature: blue, red, and yellow. All the rest are compounds: white is a mixture of all. Now, in looking long at the red, the eye becomes tired; so that when the white, which contains all the three, is presented to it, it abstracts or overlooks the red; and the blue and yellow alone being left, the paper appears green; for blue and yellow make green. So, after looking through green, it abstracts the blue and yellow (or green) from the paper, and red is left. On the same principle, if you look through yellow spectacles, the white will afterwards appear purple; for blue and red, the complement of the yellow, make purple. After looking through blue spectacles, the white appears orange, or red and yellow; and so on. This is a law of nature, which leads to a knowledge of harmony in colours: blue makes the finest contrast to orange, and red to green.

IMPARTIALITY OF NATURE.—The race is not always to the swift, nor the battle to the strong; nor riches to men of understanding, nor favour to men of skill; but time and chance happen to all. All things come alike to all. There is one event to the righteous and the wicked; to the good, to the clean and the unclean; to him that sacrificeth and to him that sacrificeth not; as is the good, so is the sinner; and he that sweareth, as he that feareth an oath. There is a just man that perisheth in his righteousness, and there is a wicked man who prolongeth his life in his wickedness. Be not righteous overmuch, neither be thou overmuch wise—why shouldst thou destroy thyself?—*Bible*.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 4.]

SATURDAY, SEPTEMBER 20, 1834.

[Price 1d.]

SYSTEM OF NATURE.

THE facts which we have already adduced, and the view which we have taken of the operation of the two extremes of Nature, lead to very important conclusions. We have already observed that a perfect analogy subsists between the physical and the metaphysical, or moral, world; that the same laws are at work in each, for both belong to universal Nature, which is one grand unity throughout. What we have affirmed, therefore, respecting the agency and re-agency of light and darkness, oxygen and hydrogen, acid and alkali, upon each other, applies in the very same sense to the agency of what we call good and evil, kindness and cruelty, love and hatred, knowledge and ignorance, justice and injustice. These two extremes are necessary to each other's existence, and to the general action of Nature.

What is justice? In the abstract sense of the word, justice is equality, perfect equality. Then suppose that Nature were perfectly just, without being unjust as well, what would be the consequence? The consequence would be that all men would be perfectly equal—equal in talents, equal in strength, equal in beauty, equal in wealth, equal in size, equal in the term of life, &c. Moreover, all other animals would be equal to men; dogs, horses, cats, rats, mice, toads, frogs, caterpillars, and periwinkles—all would be on a par; none would excel another, either in thought, word, or deed. And this would be justice! A pretty thing indeed! What a heaven upon earth this Justice would create had she all her own way! What a nice arithmetical division of gifts she would establish, and how self-contented and prim her ladyship would look after she had this millennial order of things instituted! But it very fortunately happens that there is something more than justice in nature. There is the diabolical principle of injustice—the devil himself—and he won't have it so: he must have a variety. Miss Justice would have a smooth sea, all flat as a piece of glass—not one ripple upon it; not one drop or bubble rising above another. Injustice would stir it up, and have it all bubble and froth together. He will have one animal superior to another—one individual of a species superior to another. He would introduce an infinite diversity of powers, physical and intellectual, and give the greater power an opportunity as well as an inclination to destroy the weaker power, and erect his own prosperity upon its ruins.

These are the two extremes of nature: which would you prefer? Neither, I suppose; they are both Hell and Devil. But then, again, it fortunately happens that no two parties can agree so well as these two contrary

principles. They are the two sexes of nature—their result is subordination and harmony. Injustice gains his point by creating inequality and confusion, which gives an impulse to society, and sets nature in action. Justice gains her point by for ever quelling the agitation, and bringing nearer and nearer to her own dear calm. Injustice, however, won't suffer a perfect calm; and the result is a medium of motion and rest, order and variety. This is the perfection of nature, and neither Justice nor Injustice individually could produce it. Hence, no doubt, the circumstance of judgment being given to the second or middle person of the Trinity—the logos (or word) of the ancients. The Father and the Spirit judge no man, but have committed all judgment to the Son: he has the right sort of justice and injustice—the *two natures*.

The same sort of reasoning may be employed in respect to any other two extremes; such as love and hatred, ignorance and knowledge: the one is necessary to give being to the other. Thus, if all objects were equally lovely, there could be no love; for the very circumstance of some being peculiarly hateful, enhances the charms of those which we admire and adore. Were all food equally pleasing, we should not care what sort of dishes were served up for a repast: we should wallow like swine in the mire, and fill our stomachs with the dirt of the streets. Were our knowledge perfect, we should not go in search of more; and this would create as much literary dullness as the perfection of ignorance. Wherein does the charm of conversation and reading consist, but in previous ignorance? for by these means we learn what we did not formerly know. Ignorance, then, is good, and knowledge is good, and love is good, and hatred is good. Why won't the Christians and the Jews acknowledge this, when they have their own standard authority to confirm it? "And God looked upon every thing that he had made, and behold it was very good." Some one, then, may hastily say, "If ignorance be good, what is the use of instructing men?" Because knowledge is good. "And if hatred be good, then let us continue to hate each other!" Stop, friend; remember love is good. Hate, and continue to hate, that which creates evil to yourself and others; for if you do not hate evil, you can never destroy it. Hatred is a destroyer; love is too mild for such a work; but hatred, if it were indiscriminate, would destroy good and bad; love, if it were indiscriminate, would preserve all, good and bad; but by acting in co-partnership, hatred destroys the bad, and love preserves the good. But why was not this done before? The reason is, that hatred and love were not sufficiently enlightened. Man requires a certain amount of knowledge in the arts and sciences, a certain

amount of the experience of good and evil, before he can draw the line of distinction, and separate the sheep from the goats. When this takes place, and unanimity and concert prevail in the majority—the work of destruction commences on the one hand, and of preservation on the other.*

Our predecessors were equally with ourselves desirous of creating a good understanding between the different tribes of men, and establishing a reign of universal peace: but they foolishly imagined that they could cure one evil by the employment of another. They entertained the absurd expectation of reconciling the differences of mankind by the sword, and they went forth brandishing the bloody weapon in each other's faces, shrieking in delirious zeal "The sword of the Lord and of Gideon!" The consequence was that the waters became more than usually agitated, for it was only one great spirit of confusion stirring them up from the lowest bottom. They were all exclusives, they ranged themselves on one side only; they had no idea of both sides of a question being correct; they had no idea of all things originating in one source, and the necessary corollary that resulted from it, "that truth must embrace all things, beautify and glorify every principle in nature, and find a common medium and converging point for all the vagaries of the scattered mind of humanity." For what has the mind of the species been doing all this while?—going out in different directions in search of truth, and each party has picked up a few fragments; one cries out "*I have found it*;" another, "*Nay, it is I have found it*;" and so on; not one will believe another, but each party tries to cause an apostasy from the other to itself. No one proposes that all should

* Though the original elements are good in nature at large, this is no reason why in certain combinations they may not prove hurtful or evil to us. To Nature herself no evil can accrue; for in her the two principles are fairly balanced; but we are finite and progressive creatures; and as in our first state we must of necessity have more ignorance than knowledge, this circumstance alone destroys the balance, and creates evil, which evil however must gradually disappear as the species progress, and knowledge fills up the vacuum; but it never can disappear, since we never can become infinite. Hence the truth of eternal punishments—not such inquisitorial punishments as the priests have frightened the infancy of mankind withal, but the natural punishments of ignorance, and the folly which it engenders; error is always punished by nature, and truth or virtue is ultimately rewarded with the pleasure of success. It must be so for ever, even supposing an infinity of modes of existence, through which we may successively pass. But as the kingdom of heaven is within us, so is the kingdom of hell. The one gives us all the pleasure we enjoy; the other punishes us when we do amiss, and frequently, by its terrors, prevents us from doing wrong. They are both very useful; but as we progress in knowledge and experience, we shall increase the pleasures of the one, and diminish the burning heat of the other, without ever quenching its flame—"its worm dieth not, and its fire is not quenched." These are mysteries of nature, which are first taught in riddles to children, and then unriddled by men. We shall find at last that it is wisely done; for who is wiser than our common mother—are you?

return to a common centre, and there confer together upon the result of their various discoveries; for each has discovered some truths—what else could they discover? Have they been out of nature? No, but their reports are so absurd! So are all parts of an image, until they are united with the whole. Set up a statue in the middle of a circle, and set a thousand different artists around the circumference of that circle, to make a thousand different drawings of the statue; then examine all the draughts, and you find them all different, even supposing each drawing to be perfect in itself. One has drawn the front, another the back; another the right, another the left side, and the rest have drawn the intermediate views. They are all right, and all different. Well, suppose one artist were to maintain that his is the only right copy, merely because it is right; what a fool he would be accounted! One has made the image stoop on one side, the other has made it stoop on the other side; in the one, it raises its hand on the right side of the paper; in the other, on the left side. Can they both be right? Yes; for the one has seen the back of the figure, and the other the front. This is a perfect resemblance of the sectarian divisions of men; and as a perfect idea of the statue cannot be obtained without comparing all the different views together, so neither can truth be discovered, nor a perfect system of nature completed, unless all the conflicting opinions of mankind respecting general principles are brought together and concentrated in a point—by the mutual charity of each party listening with candour to the other's experience. Hence the old saying, "Charity believeth all things." Not that all minor details or particulars are literally true; but that all general principles, all wide-spread and prevailing doctrines upon general subjects, contain the embryo or seeds of truth, which a candid and enlightened mind alone can discover. If it is not the oak itself, it is the acorn; if it is not the fir-tree, it is the fir-top, if not the fir-top, it is the seed of the fir-top. Such, we are convinced, is the great ultimate truth which shall bring peace on earth; and therefore every system of nature which excludes from its embraces any one system of philosophy or superstition which has prevailed in the world, is a mere soap-bubble, which shall burst and dissipate in thin air after a momentary glitter.

THE SHEPHERD.

ASTRONOMICAL.

THE ancients paid a most devoted homage to the study of the heavens; they were directed in almost every public and private movement by the voice of the stars; and it reflects a very great honour upon the early inhabitants of the eastern world, that the highest dignities were conferred upon those to whose indefatigable exertions we are indebted for the advancement of astronomy and the sciences connected with it. The Chaldeans were celebrated above all others for their astronomical observations. Diodorus Siculus informs us that there was incessantly one or more of the chief astrologers employed on the Tower of Belus in reporting the aspect of the heavens; but for want of mathematics and optics to complete their

demonstrations, the science was necessarily left in a very imperfect condition.

There is a singular resemblance between the astronomy and mythology of the ancients, which has led many to suppose that the fables of the gods are merely allegorical representations of the phenomena of the heavens. If so, it is very singular that the historians and philosophers should have made no allusion to the subject, but left the whole mystery to be unriddled by the moderns. If they had perceived the correspondence, how did they not reveal it to the public? This, perhaps, may be answered by the fact, that what are called the mysteries of the ancients were known only to the initiated, who were bound to conceal them from the ken of the vulgar. We shall not at present stop to enquire whether this was the case or not; but we may observe, that there is the same singular resemblance between the celestial phenomena and other departments of nature, and the same power of nature which impressed the image of the heavens on the productions of the earth, may also have given this family resemblance to the operations and productions of the mind. It is all *one* nature, and no more.

The zone, or girdle of the heavens, has been divided into twelve signs. This is a division of nature, comprising the twelve months of the solar year. Hence this number twelve has been sacred amongst all people. The Chaldeans had a cycle of twelve years—the Chinese have the same. The Greeks have their twelve major and minor gods, the Jews their twelve patriarchs, the Christians their twelve apostles, the Mahometans their twelve tribes and their twelve Imams. But as there are somewhat more than twelve months in the year, or nearly thirteen lunar months, so the Jews have their thirteenth patriarch and tribe, the Christians their thirteenth apostle, and the Mahometans their thirteenth Imam, who is to come at the end of the world, and destroy AL DEJAL, the man of sin.

M. Court de Gebelin has given a very beautiful illustration of the Grecian fable of Hercules, and his twelve labours, &c. Remember he also had a thirteenth labour. Hercules, he says, is the symbol of the sun, particularly the sun of the spring; Hebe, the cup-bearer of the gods and the patroness of health, who was given him for a wife, is the symbol of youth, which the sun restores every succeeding year. His twelve labours are the twelve signs of the zodiac. There is nothing, even to the combat with the Amazons, a nation of female warriors, which, according to Gebelin, does not bear allusion to the course of the sun. During the winter, until the month of March, the nights contend with the sun for the girdle of the heavens, that is the zodiac. Now the word Amazon signifies union-zone. These nights of winter reign in union on the same zone, for until the month of March they are longer than the days. At last Hercules becomes master, and takes the girdle from them. The queen who delivers up this girdle is called Menalippe, which signifies the queen of the dark horses—emblem of night. The victory of Hercules, or of the sun of the vernal equinox, happens, according to the fable, on the banks of the Thermodon—that is, the river of heat, in a place called Themiscire—*i. e.* equality of nights. Moreover, the nine Muses, he

says, are the nine months of the year during which the husbandman labours. The three Graces, the three winter months—the months of repose, love, and pleasure. The fifty sons of this hero, are the fifty weeks of the year at the time when it had only 350 days, with five intercalary days to complete the lunar year. These were the sons of the fifty daughters of Danaus, his mistresses, for one revolution of the sun embraces all the fifty weeks. In hell these ladies were employed in filling fifty bottomless tubs for ever—for the fifty weeks are incessantly moving, and only cease in order to commence anew, &c.

These and many other resemblances are striking; but still it must be observed that there are many parts of the fables which do not tally with astronomical phenomena, and cannot, without much straining, admit of a comparison. Hence it still becomes a matter of doubt whether the ancients knew any thing at all of the resemblance which we now perceive, and could trace it so accurately and with such minutiae of detail. The resemblance is a fact: the conclusion is left to the judgment of the individual who investigates the subject. But very few are qualified to form a candid opinion upon the question; men are so thoroughly imbued with party feeling, so anxious to obtain a victory over their opponents on the other side, that like a drowning man who grasps at a straw to preserve him from sinking, they eagerly embrace any plausible argument which may be wielded with effect against their adversaries, having no other object in view but possession of the field. It is impossible for us to prove that the ancients had any other source for these fables than their own wild imaginations or general nature, and not the celestial prototypes in particular to whose inspiration they have been so ingeniously ascribed. For we may easily find other resemblances in nature besides those which the firmament presents.

Thus, for instance, there are twelve ribs in the human body; two tribes of the Jews were separated from the other ten, and so are the two lower ribs of the human body; seven of the sons of Jacob were the legitimate offspring of their father, and attached in every respect to his home, and five were separated from their brethren; and seven of the ribs are united to the breast-bone, whilst five are not. Did the Jews borrow this from the anatomy of the human body, or did they borrow from the heavens? They and the Egyptians studiously avoided the study of anatomy, and all allusions to the revolting subject, except it was to strike terror into the minds of the living by some memento of mortality, which it is not probable they would incorporate with so beautiful a science as that of astronomy. And where could they find such divisions in the heavens more distinctly developed? Yet they are to be found*. But which is the

* The year was divided into seven summer and five winter months. Two signs of the zodiac, Aquarius and Pisces, are the only two watery signs, and thus become divided from the rest; therefore the year at one time consisted of ten months only, and these two signs, namely, January and February, were excluded: Numa Pompilius added them to the Roman calendar. Hence Janus, according to Macrobius, who does not account for it, was represented with the number 300 in his right hand, or the

original? Are they not all original? Certainly it is quite as likely that Nature should bring forth three original likenesses, as two originals and a copy.

The cycle of twelve was also discovered in the movements of Jupiter, the prince of the planets, who takes twelve years and five days to make the circuit of the zodiac, that is, to appear again in the same point of the heavens. The Romans had a cycle of fifteen, and neither they nor the moderns profess to know the origin of it. It is, however, of great antiquity, and still used by the Popes in their bulls. It is called the Indiction, and always noticed in our almanacks. This present year is the seventh of the Indiction. But we can easily see its resemblance, or prototype, in the heavens. Mars, the God of war, and the patron of the Roman empire, takes fifteen years, minus eighteen days, to make his apparent circuit of the zodiac. It seems simply to have originated in three lustræ, a Roman lustre being five years, at the end of which a general census of goods and chattels took place; however, it chanced, if you can call any thing chance, to move in harmony with the great machine. And such you will find to be the case with a thousand other subjects which, had you your will, you would now blow away and scatter like snuff upon the ground. But you shall not have your own way; Nature won't permit it. Wisdom alone can settle all things; "why then do the heathen rage, and the people imagine a vain thing?"

THE DAYS OF THE WEEK.

As many of our readers are unacquainted with the origin of the names of the different days of the week, and of the order of succession in which these days now stand, we shall in a few words give them a little light upon the subject. The seven planets of the ancients, which are represented by the seven days of the week, were supposed to stand in the following order, in relation to their distance from the earth, which was supposed to be the centre round which they all revolved—*Saturn, Jupiter, Mars, Sun, Venus, Mercury, Moon*; and if the days of the week were arranged in this manner, they would stand in the following order—*Saturday, Thursday, Tuesday, Sunday, Friday, Wednesday, Monday*. How then does it happen that the order has been altered to that which

ten months, and 65 in his left, being the odd days, or two months. Hence, even our own year is thus divided; for December, the twelfth month, is named the tenth: *Decem* is ten; November the ninth; October the eighth; September the seventh; August was formerly called *Sextilis*, i. e. the sixth, before Augustus, from whom it is named; and July was called *Quintilis*, that is, the fifth, until the time of Julius Cæsar; March is the first, leaving two untold. The Chinese make use of these two numbers, ten and twelve, in another way; they have two names for every year, taken from two lists of words, one list containing ten, the other twelve words. The first year of their cycle goes by the names of the two first words, one from each list; the second by the two second words, &c. When the series of ten is finished, the first word is then combined with the eleventh word of the dozen, &c. So that the first of each series never meet again for sixty years, which is their cycle, similar to our century.

they now occupy? The reason is as follows. These seven planets, like the seven angels of the astrologers, were supposed to rule over the week, but their dominion lasted only one hour, and each took the post of sentinel in succession. One hour was thought quite sufficient for one of the celestials to walk upon duty: though poor unfortunate cat-o'-nine-tail victims have three or four times the amount imposed upon them at once. Beginning with the first hour on Saturday morning, therefore, which belongs to Saturn, and committing one hour in succession to each of the rest, we find that the Sun has the first hour of the next day, the Moon of the next, Mars of the next, Mercury of the next, Jupiter of the next, and Venus the last, which is the order of our present days of the week.

The names are of Saxon origin—Wednesday is derived from Oden or Woden; Tuesday from Tesc; Thursday from Thor; Friday from Frey, or Freg—Saxon deities, corresponding to Mercury, Mars, Jupiter, and Venus amongst the Greeks and Romans. The ancients made out their seven planets by the help of the Sun and Moon, not knowing the solar system, as it was discovered and demonstrated by Copernicus, Newton, and Herschel. We now make up the seven by Uranus and the Earth. Still there are seven, and only seven, primary planets. The ancients had a false seven; we the true; which is strictly in accordance with the law of progress—error preceding truth, and yet containing within it the embryo of truth. The SEVEN was the truth to be developed, but it could not be developed until the sciences had made a certain advancement—Nature therefore provided a substitute, in other words, a type; and we find these types to abound in every department, every corner, of thought; hence we have good reason to conclude that all universally-received or widely-prevalent ideas, though literally false in themselves, are strict representatives of truths to be hereafter elicited.

This disposition of the days of the week was also in accordance with the principle of a species of music called by the Greeks "*Diatesseron*," which consisted of four notes with three intervals, thus There was a leap of two notes from the first to the last, or two silent notes; which corresponds to the manner in which the planets are selected, always passing two; thus, Saturn, Sun, Moon, Mars, Mercury, Jupiter, Venus.

This is the manner in which they have been arranged in all countries. But the beginning of the week has differed with different nations. Thus the Egyptians commenced their week on Saturday; the Indians, Mahometans, &c. begin their week on Friday, the Jews and Christians on Sunday; there being three days out of the seven which are kept sacred as days of rest.

DESTRUCTION AND CREATION.

TO THE EDITOR OF THE SHEPHERD.

LETTER II.

LET us pursue our enquiry. Is organized matter destructible? Death walks the earth, and with awful impartiality cuts down even the most exalted of its inhabitants. Their noble forms sink into the dust, and dwindle into almost nothing; so that in a short period all that remains.

of these once proud and godlike structures is a few earthly particles. But where is the rest? Where the blood, the muscles, and the nerves? They are of complicated structure, and the elements which composed them have entered into fresh combinations, and exist as ingredients of new creations. For as soon as the mysterious spirit of life departs, the various elements of the body become refractory; they seek new acquaintances and enter into new combinations; and thus a total decomposition is established. Blood is no longer blood, muscle is no longer muscle; for the elements of their substances, unrestrained and unawed by the presence of the soul, have rebelled and flown away to become the servants of another master. The gases are already food for plants, and will be ultimately food for man; the liquid particles have arisen into the air, while the earthy or metallic portions remain behind. What an interesting, what a sublime reflection for the philosopher! Even in death he lives and is of service to humanity! He confers fertility on his native soil, and surrenders back to nature the goods he has enjoyed; goods that are now to be appropriated to other uses. Were it permitted him in an after existence to observe this appropriation, with what an intense delight would he avail himself of the interesting privilege! "Here," he might say, "was a barren spot; behold it fertile. See the rich luxuriant corn; that corn gives food to the hungry and the labourer, it animates the almost exhausted energies of a hero, it exhilarates a Bacon, it gives vital energy to a Newton; nay more, it even enters into their systems, and becomes a part of the very substance of their bodies." But where is the liquid portion? Behold it in the dew, or in the copious shower which descends upon the earth to revive exhausted nature; or see it in the cloud, wafted by prosperous gales over distant lands, and deposited perhaps in the bosom of the Atlantic Ocean.

Since making the above remarks, the following very beautiful funeral oration has been recalled to my recollection. It is quoted by Helvetius, who describes it as pronounced by the Parsia, a people of Cambya in the Empire of Mogul, over the tomb of a great man. "O earth, O common mother of human beings, take back what to thee appertains of the body of this hero; let the aqueous particles that flowed within his veins exhale into the air, and, falling in rain on the mountains, replenish the streams, fertilise the plains, and roll back to the abyss of ocean from whence they proceeded! Let the fire concentrated in this body rejoin the heavenly orb, the source of light and heat! Let the air confined in his members burst its prison, and be dispersed by the winds in the mundane space. And lastly, thou, O breath of life, if perchance thou art of a nature separate from all others, return to the unknown being that produced thee; or if thou art only a mixture of material elements, mayest thou, after being dispersed in the universe, again assemble thy scattered particles to form another citizen as virtuous as thou hast been!"

Enough has been said to show that, in the organic world, destruction is unknown, and that what is commonly called destruction is nothing more than a succession of changes, which are absolutely necessary in the present system of the world. What we call death, is a means of maintaining life, and, as such, is perfectly essential to the present order of things. Vegetables lose their summer clothing, which decays to form their future nourishment and support. The same law holds good with regard to the animal creation. Even man, the lord of all, lives by the death of others, animal and vegetable; and if they had eternal life, man must perish. The sys-

tem of nature must be altogether changed if life were made eternal. Under the present order of things, death is essential to life; nay more, death is the parent of life.
R. J.

ANCIENT MANNERS AND CUSTOMS OF THE ENGLISH.

THE following account was written anno 1678, and taken from the MS. collections of Mr. Aubrey, in the Ashmolean Museum, at Oxford; published in the Antiquarian Repertory.

There were very few free-schools in England before the Reformation: Youth were generally taught Latin in the monasteries, and young women had their education in nunneries, where they learnt needle-work, confectionary, surgery, physic (apothecaries being at that time very rare), writing, drawing, &c. &c.

The nuns of St. Mary Kingston, in Wilts, were often seen coming forth into the Nymph Hay, with their rocks and wheels to spin, sometimes to the number of seventy; all of whom were not nuns, but young girls, sent there for education.

Anciently, before the Reformation, ordinary men's houses, such as copyholders and the like, had no chimney, but flues like louver-holes.

In the halls and parlours of great houses, were wrote texts of scripture on the painted cloths. The lawyers say, that before the time of King Henry the Eighth, one shall hardly find an action on the case, as for slander, &c., once in a year, *quod nato*.

In gentlemen's houses, at Christmas, the first dish that was brought to table was a boar's head, with a lemon in his mouth.—At Queen's College in Oxford, this custom has been retained in late years; the bearer of it brought it into the hall, singing to an old tune, an old Latin rhyme, *Caput apri deferro*, &c. "I bring a boar's head," &c.

The first dish that was brought up to the table on Easter-day, was a red herring, riding away on horseback; i. e. a herring ordered by the cook something after the likeness of a man on horseback, set in a corn salad.

The custom of eating a gammon of bacon at Easter, which is still kept up in many parts of England, was founded on this, viz. to show their abhorrence of Judaism, at that solemn commemoration of our Lord's resurrection.

The use of "your humble servant," came first into England on the marriage of Queen Mary, daughter of Henry the Fourth of France, which is derived from *Votre très humble Serviteur*. The usual salutation before that time was, God help you! God be with you! and among the vulgar, How dost do? with a thump on the shoulder.

Till this time the court itself was unpolished and unmannered. King James's court was so far from being civil to women, that the ladies, nay, the queen herself, could hardly pass by the King's apartment without receiving some affront.

At the parish priest's houses in France, especially in Languedoc, the table cloth was on the board all day long, and ready for what was in the house to be put thereon, for strangers, travellers, friars, and pilgrims.

Noblemen, and gentlemen of fair estates, had their heralds, who wore their coat of arms at Christmas, and at other solemn times, and cried *Largesso* thrice. A neat built chapel, and a spacious hall, were all the rooms of note, the rest more small.

At Tomarton, in Gloucestershire, anciently the seat of the Rivers, was a dungeon thirteen or fourteen feet deep;

about four feet high were iron rings fastened to the wall, which were probably to tie offending villains to, as lords of manors had this power over their villains (or soccage tenants), and had all of them no doubt such places for their punishment. It is well known all castles had dungeons, and so it is believed had monasteries, for they had often within themselves power of life and death.

In King Henry the Third's time, the Pope gave a bull or patent to a company of Italian architects, to travel up and down Europe to build churches.

In days of yore, lords and gentlemen lived in the country like petty kings; had *Jura regalia* belonging to their seigniories; had their castles and boroughs; had gallows within their liberties, where they could try, condemn, and execute; never went to London but in parliament time, or once a-year to do their homage to their king. They always ate in gothic halls at the high table, or oriella, (which was a little room at the upper end of the hall, where stood a table,) with the folks at the side tables. The meat was served up by watchwords. Jacks are but of late invention. The poor boys did turn the spits, and licked the drippings for their pains. The beds of the men servants and retainers were in the hall, in which the mumming and the loaf stealing, and other Christmas sports, were performed.

The hearth was commonly in the middle; whence the saying, "round about our coal fire."

Every baron and gentleman of estate kept great houses for men at arms; some had their armories sufficient to furnish out some hundreds of men.

The halls of the justices of the peace were dreadful to behold: the screen was garnished with corselets and helmets, gaping with open mouths, with coats of mail, lances, pikes, halberds, brown bills, batterdastors, and buckles. Public Inns were very rare. Travellers were entertained at religious houses for three days together, if occasion served. The meetings of the gentry were not at taverns, but in the fields or forests, with hawks and hounds, and their bugle horns, with silken bawdies.

Every gentleman-like man kept a sparrow-hawk, and the priest a hobby: it was a divertisement for young gentlewomen to manne sparrow-hawks and merlines.

Before the Reformation there were no poor-rates; the charitable doles given at religious houses, and church ale in every parish did the business.

In every parish there was a church house, to which belonged spits, pots, crocks, &c., for dressing provisions. Here the housekeepers met, and were merry, and gave their charity. The young people came there too, and had dancing, bowling, &c. There were few or no almshouses before the time of King Henry the Eighth. That at Oxford, opposite to Christchurch, was one of the most ancient in England. In every church was a poor-man's box, and the like at great inns.

Before the wake, or feast of the dedication of the church, they sat up all night fasting and praying, viz. on the eve of the wake.

In the Easter holidays was a clerk's ale for his private benefit, and the solace of the neighbourhood. Besides the jollities above-mentioned, they had their pilgrimages to several shrines, as to Walsingham, Canterbury, &c. The crusades to the holy wars were magnificent and splendid, and gave rise to the adventures of the knight-errants, and romances. The solemnity attending processions in and about churches, and the perambulations in the fields, were great diversions also in those times.

Glass windows, except in churches and gentlemen's houses, were rare before the time of Henry VIII. Copyholders and poor people had none.

Noblemen's and gentlemen's coats, were of the bedals and yeomen of the guard, i. e. gathered in the middle. The benchers in the Inns of Court yet retain that fashion in the make of their gowns.

When a church was to be built, they watched and prayed on the vigil of the dedication, and took that point of the horizon where the sun arose for the east, which makes that variation; so that few stand true, except those built within the two equinoxes. This has been frequently proved, and the line found to point to that part of the horizon where the sun rises on the day of that saint to whom the church was dedicated.

In Scotland, especially among the highlanders, the women make a courtsey to the new moon; and our English women have a touch of this, some of them sitting astride of a gate or stile, the first evening the new moon appears, and say—A fine moon, God bless her!

The Britons received the knowledge of husbandry from the Romans; the foot, and the acre, which we yet use, are the nearest to them. In the West and North, they gave no wages to the shepherd, but he had the keeping of so many sheep with his master's flock. Plautus hints at this, in his *Asinaria*, Act III. Scene I. Etiam Opilio, &c.

The Normans brought with them into England civility and building, which, though it was gothic, was yet magnificent. Upon occasion of bustling in those days, great lords sounded their trumpets, and summoned those that held under them. Old Sir Walter Draycott kept a trumpeter, and rode with thirty servants and retainers. Hence the sheriff's trumpets at this day. No younger brothers were to betake themselves to trades, but were churchmen, or retainers to great men.

From the time of Erasmus, until about 1650, the learning was downright pedantry. The conversation and habits of those times were as starched as their bands and square beards, and gravity was taken for wisdom. The doctors in those days were but old boys, when quibbles passed for wit, even in their sermons. The gentry and citizens had little learning of any kind, and their way of breeding up their children was suitable to the rest. They were as severe to their children as their schoolmasters; and their schoolmasters, as masters of the house of correction. The child as perfectly loathed the sight of his parents, as the slave his torture. Gentlemen of thirty or forty years old, were to stand like mutes and fools bareheaded before their parents, and the daughters (grown women) were to stand at the cupboard side, during the whole time of their proud mother's visit, unless (as the fashion was) leave was desired that a cushion was to be given them to kneel upon, brought them by the serving man, after they had done sufficient penance in standing. The young fellows had their foreheads turned up, and stiffened with spittle; they were to stand mannerly, thus:—the foretop ordered as before, with one hand placed at the bowstring, and the other behind.

The gentlewomen had prodigious fans, as are to be seen in old pictures, like that instrument which is used to drive feathers, and it had a handle at least half a yard long; with these the daughters were oftentimes corrected. Sir Edward Coke rode the circuit with such a fan. The Earl of Manchester also used such a fan. But fathers and mothers slashed their daughters after the manner of infant discipline, when they were perfect women. At Oxford, the rod was frequently used by the tutors and deans: and Dr. Potter, of Trinity College, whipped his pupil with his sword by his side, when he came to take his leave of him, to go to the Inns of Court.

EFFECTS OF LUXURY AND REFINEMENT UPON THE TEMPER AND DISPOSITION.

A high degree of luxury and refinement has, I apprehend, a considerable effect in increasing the sensibility, especially with regard to the passions. This it performs by several means.

Luxury, as I shall hereafter mention, is almost always accompanied by indolence; a circumstance that of itself conduces, by weakening the body, to increase the sensibility.

Luxury, likewise, is generally accompanied with warmth, or at least an equality of temperature; a thing that I have before observed tends to produce the same effect.

Luxury, also, as being generally unfavourable to health, and thereby rendering the body less robust and strong, contributes to increase the sensibility of the system.

But what chiefly, I apprehend, conduces hereto, is the habitual indulgence that is given to the passions by luxury. These, as well as the simple sensations, are capable of having their sensibility, or rather their irritability, greatly increased by use and practice; and the custom of giving a scope to our desires on every occasion, which is essential to luxury, is apt to multiply our wishes, and our uneasiness at our inability to gratify them. Thus we see children, who are accustomed to be indulged on every occasion, have their wishes thereby enlarged, and are apt to break out into violent sallies of anger, when the object of their desires cannot be procured to their expectations.

The same quality is equally perceivable at a more advanced period of life. It is well observed by a great moralist, that he who fixes his attention on things always before him, will never have long cessations of anger; and, as nothing can occur more frequently than the objects of luxury, it must happen that the passions of its votaries must be subject to numerous excitements of this kind.

The petulance of those addicted to this indulgence has been observed in all ages.

But although the sensibility, with respect to the passions, be increased by luxury, the sensations in this case are merely selfish, and bear little respect to the welfare or feelings of others, and, indeed, often to common humanity. The cruelties practised, in the most deliberate and protracted manner, upon some brute animals, the devoted victims of luxurious indulgence—which it would be disgusting as well as improper to repeat—evinces this position very strongly, even in the present age. And in former times, the connection of luxury with cruelty, even towards the human species, appears to have been very remarkable.

Athenæus observes the cruelty of the people of Miletus, and of some of the Scythian nations, which, he tells us, was ascribed by the philosophers of antiquity to their luxury. The same quality, he observed, prevailed among the Ionians, which he derives from the same cause. The Roman emperors Vitellius and Elagabalus, whilst they betrayed the most abject submission to their appetites, astonished the world at the same time with their multiplied inhumanities.

The same insensibility took place in the public, as well as private feelings. Athenæus tells us, that at the period of the battle of Chæronea, and the important but melancholy consequences to the liberty of Greece that attended it, a number of Athenian citizens, of some rank and distinction, were found so totally insensible to the interests, dangers, and distresses of their country, that they formed themselves into a convivial society, called the Sixty, and employed their time in feasting, drinking, and gaming, and in sprightly and satirical exercises of wit and pleasantry. No public affairs, whatever, were considered by them as of consequence sufficient to interrupt their mirth or disturb their tranquillity. They saw their countrymen arming for battle, and heard of their captivity and death with the utmost indifference. Events and actions of the most serious kind were treated by them with wantonness and levity.

The same effects took place amongst the Romans: Cato, in the speech ascribed to him by Sallust, reproaches his countrymen with valuing their villas, statues, and pictures, at a higher rate than the republic; which selfishness of character he attributes principally to the luxury that prevailed amongst them.

The stupid insensibility of the emperor Vitellius, with respect to public affairs even wherein his own life and safety were concerned, is described in striking terms by Tacitus:—"That emperor," says this great writer, "substituted the pleasures of luxury in the place of concern for public affairs, neither taking care to provide the necessary implements of war, nor to strengthen the attachment and discipline of his troops by public addresses or military exercise, nor, indeed showing himself at all in public; but hiding himself in the shades of his gardens, like those animals, to which, if food is supplied, they lie torpid and insensible, he there buried all regard for the past, present, and future, in equal oblivion."

The effects of a luxurious disposition in superseding public concern among the people at large, were visible in a remarkable manner at Rome. The people were there exasperated against Augustus, on account of some laws which he had made; but upon his recalling Pylades the comedian, whom the jarring of some of the factions had driven out of the city, the discontent ceased. That people were more concerned for the interruption of their pleasures than the loss of their liberty.

But the effects of luxury in destroying public virtue are not only discernible in persons who had been previously corrupted in other respects, or in the caprice of a licentious rabble, but have been even exerted upon some characters in other respects highly worthy of admiration. Lucullus, the conqueror of Mithridates, and the subduer of Asia, after he had abandoned himself to luxury and effeminacy, never interested himself about public affairs, nor lent his assistance towards repressing the exorbitant power of Pompey. Antony, in like manner, seemed infatuated with the pleasures of Egypt, and tamely surrendered the empire of the world to one far his inferior in political as well as military influence and conduct.

A great writer of our own country has, in a striking, though somewhat ludicrous manner, described the in-

fluence of a certain species of luxury in suppressing regard for decorum and dignity of character in private life.

Indolence, which is itself a species of luxury, is also a frequent attendant upon the other kinds of it. The connection between these is remarked by several of the Roman writers, and was particularly observable among that people.

The connection of this with the other branches of luxury is sufficiently obvious.

Timidity is, I believe, another quality that usually accompanies luxury. The increase of sensibility, the diminution of strength, and the habit of indolence that luxury inspires, are all of them unfavourable to vigour and resolution of mind, which are mostly combined with steadiness, strength, and activity. The Romans, who at an early period of their history found little difficulty in the conquest of most of the barbarous nations, afterwards became by luxury, so degenerate, as to fall an easy prey to the people they had subdued, and to become an object, even to them, of the highest contempt. The name of Roman was supposed to comprehend every thing ignoble, timid, avaricious, luxurious, and false; and, in short, every kind of vice. The luxury in which this people were involved, contributed, in a great measure, to this change of character.

Pride is another quality evidently excited by luxury. A man that sees constantly all the gratifications of appetite placed before him, without any effort or trouble of his own, is apt to fancy a superiority in himself to others, and to encourage high ideas of his own importance. The petulance, also, which luxury so naturally inspires, is itself a species of pride, and gratified in a similar manner.

For the reasons above given, those who are addicted to luxury have but little capacity for private friendship.

Friendship necessarily requires some sacrifices of ease and pleasure for the sake of others; but the luxurious man is wrapped up in himself, and has little consideration for any one else.

Sallust observes, that people addicted to this passion pass through life as travellers do through a country, that is, without any regard to, or connection with, the people that live in it. It was a remark of the elder Cato, that friendship could have no place with a man whose palate had a quicker sensation than his heart.

Fickleness, irresolution, and disgust, are also, I believe, among the passions that attend a life of luxury. This we see exemplified every day, and also experience that this kind of satiety, which is produced by luxury, is, perhaps, one of the severest sufferings of which our nature is capable; and what frequently urges those who are necessitated to endure it to put an end to their miseries by a voluntary death.

Pure enjoyment, or the gratification of all desires—the point aimed at by so many—is mercifully withheld from the favourites of Providence, and only bestowed on those who are weak enough to desire it; and to whom it brings its own punishment.

In short, human life, rightly understood, is a scene of action, not of inactive enjoyment; and its duties, if properly observed, constitute its pleasures likewise; so wisely has Providence ordained, that the doing of our duty should have a present as well as a future reward.—*Dr. Falconer.*

ON THE DEATH OF A FAVOURITE CHILD.

Poor little Robert now is dead !
So 'tis ordained on high ;
The infant and the hoary head,
Or rich or poor, must die.

Now are his sorrows lull'd asleep,
His agonies are o'er—
And shall we not in pity weep,
That Robert is no more ?

To see the murdering ruffian die,
Starts forth a pitying tear ;
But who can such a boon deny,
To one they held so dear ?

Just as his pretty lisping tongue
Could utter sounds so sweet,
His tender little heart was wrung,
His bosom ceased to beat.

With anxious care his mother eyed
Her darling's fleeting breath ;
Whene'er he moved, whene'er he sigh'd
She fear'd the approach of death.

Enfolded in her arms he lay ;
The parting kiss was given ;
When, as by instinct taught to pray,
He raised his eyes to heaven ;

And with a look that seemed divine,
As if his soul desired
Its feeble body to resign,
The innocent expired. J. M., 1820.

PHILOSOPHICAL LANGUAGE.—“Why,” says Horace, “does one brother like to lounge in the forum, to play in the campus, and anoint himself in the bath, so well that he would not put himself out of his way for all the wealth of the best plantations of the East; while the other toils from sunrise to sunset for the purpose of increasing his fortune?” Horace attributes the difference to the influence of genius and the natal star; “and eighteen hundred years,” says a writer in the *Westminster Review*, “have only taught us to disguise our ignorance under a more philosophical language.” How can the language of ignorance be the language of philosophy? Yet so it is; philosophers, with all their knowledge of particular facts, are utterly ignorant of general or first principles; and the Westminster philosopher has unwittingly let out the secret, that the language of philosophy is the language of ignorance.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 5.]

SATURDAY, SEPTEMBER 27, 1834.

[Price 1d.]

SYSTEM OF NATURE.

THERE is yet one view of the two extremes of nature, which at present is perhaps of more importance than all the rest, although depending for its elucidation upon the proper understanding of the former; and that is the view which embraces Faith and Infidelity. Let us analyze these two. Faith is merely the assent of the mind to what we hear, whether we understand it or not; and infidelity is the dissent of the mind. These are not their common, but abstract meanings—at present we do not mean to view them in any other light. In this sense they are both bad, inasmuch as the former receives, and the latter yields, without discrimination or judgment. Without infidelity, faith would not enquire; and without faith, infidelity would not enquire: but the two principles stimulating each other, produce investigation, conflict of mind, discovery of facts, and demonstrations of elementary truths.

In the infancy of society, when men are ignorant, faith and infidelity are ignorant also; as knowledge increases, each party becomes more enlightened, and clothes by degrees its theories in the garments of philosophy. There always were two such parties in existence. We find them pretty well balanced amongst the Greeks and Romans, respecting the subject of oracles, or revelation. The Platonists and Stoics defended the faith of the oracles. The Cynics, Peripatetics, and Epicureans were opposed to them. Half the wise men of Greece and Rome, therefore, might be called believers, the other half infidels. 'Tis so still in Christendom, and every other portion of the civilized or even barbarous world. The subject of discussion is still the same, although modified and altered from time to time, as new circumstances occur and society advances in the progress of the sciences. The mode of arguing is exactly the same now as formerly, only the ancients argued respecting revelations which were being made daily in their own generation; we now chiefly divide upon those which were made in former ages.

The mode of reasoning may be thus described. The one party says that Nature does make private revelations to individuals, by means of voice and vision from an unknown cause; that these revelations contain some remarkable truths, and if the remainder appears to be rubbish or false, it is because we do not understand it; and they conclude by saying that these oracles deserve to be held in particular reverence, inasmuch as they proceed from a divine source. This is the reasoning of the Platonist, the Stoic, the Christian, the Mahometan, and

the Southcottian, the latter being more nearly allied to the Platonist, inasmuch as he receives modern revelations, those of his own generation. The other party says nay to all this, and he maintains his point by saying that there is a great deal of craft and trickery perceptible in the instruments by whom these revelations are said to be made, that many of these predictions are literally false, and all are generally couched in such mysterious language as to be susceptible of many different significations. They maintain that, if Nature, or God, which is the same thing, did give a revelation of any kind, it would be strictly true, and so plain that every one would understand it.

Both these modes of reasoning are absurd, and arise from ignorance of the first principles of natural science, namely, the doctrine of the two extremes; for this doctrine teaches us that Nature employs the two principles of truth and error in communion, in order to excite the enquiry of the human mind, and stimulate it to the cultivation of its faculties; that all our knowledge is laboured by our own exertions out of previous ignorance, and consequently it is quite in consistency with the analogies of Nature to suppose that mysteries or riddles should be propounded to man upon certain subjects, on which he could not come to any determination without them—that these mysteries should run their course with the other sciences, and be unriddled along with them; for all the sciences are merely one science. Hence it follows that the one party errs in ascribing any particular sanctity or superiority to these revelations, and the other party errs in attempting to prove their nonentity by the trickery and falsehood which attach to them—for truth and error, sincerity and trickery, are all attributes of the same universal Nature, and are essentially necessary to the proper development of the intellectual faculties of men, who, by the experience of both, at last attain to the exercise of a sound judgment on all the phenomena of nature and the affairs of life. Error trains by fear, and truth trains by love. The fear of evil is as discreet and useful a guide as the love of good. But fear is the best teacher of ignorance. Brute animals and children are governed by the rod. Hence error, which partly occasions fear, is more fully developed in the early history of men than truth. Its evils are demonstrated by experience, and if that experience be essential to the formation of a sound judgment, is it not most illogical to argue that such and such things are not divine, merely because they lead the minds of men astray, and create sectarian divisions? Certainly it is; for these sectarian divisions promote in a remarkable manner the final de-

monstration of truth, inasmuch as they send forth a variety of minds to the investigation of a variety of subjects. They resemble the division of labour in the arts and manufactures, by which a particular department is allotted to each class, and the article itself is the final product of the combined labour of all. Truth is too great to be studied as a whole; it requires to be divided and scattered amongst the different sects and individuals of society. When each has finished his work, the whole are compared and united, and the system is completed. This is beautifully expressed in the language of a Jewish bard: "He that scattereth Israel shall gather him, and keep him as a shepherd doth his flock." The scattering is for the elaboration of the details, and processes of the great work of human instruction; the gathering is the completion; and this gathering only can take place when science has revealed the grand secret of fitting together all the scattered theories of mankind, and making one of many, "that they all may be one in us, as I in thee, and thou in me."

The reasoning of both parties is erroneous,—of the vulgar infidel and the vulgar believer; for the one denies the divinity of religion, because it is false and productive of mischief; the other maintains that there is only one religion divine, and that all the rest are not divine, which is equally absurd. Here then we are at variance with both; we are like Ishmael, the son of Abraham; our hand is against every man, and every man's hand against us; we cut right and left; for the sword of Nature is a *two-edged* sword, and truth, the truth for man's happiness, is not to be found in one extreme or another, but in the judicious balancing of both.

But, in reply to the position which we have taken, it may be urged, that if all religions be divine, they are all equally important. This is but a weak argument, but as it is often urged, we shall reply to it. All productions of Nature are not equal. Man is superior to a dog, a dog to a cat, a cat to a rat: and there is only one scientific animal—man. According to this analogy, there ought to be one superior religion, equally beyond all others. Again, man is the most depraved, the most cruel, and the most ferocious of all animals. According to this same analogy, this superior religion of which we speak ought to be the most depraved, the most cruel, as well as the most scientific of them all. Is it not so? It matters not when it arose, nor how it arose. Miracles won't prove it true, nor the want of miracles prove it false. The only question is, does it exist? Is it more powerful than any other? Yes. That's enough. Then it has been of some momentous use, in the economy of Nature—momentous in proportion to its superiority and its prevalence; but if it has produced even temporary evil, it is a temporary institution; for all evil, and the causes of evil, are doomed to perish as soon as they are fairly convicted. Upon this subject, however, we cannot enter at present.

In the meanwhile we shall close this chapter with a few of those beautiful types or analogies with which Nature has given such rich variety, and at the same time uniformity, to all her productions. We have already demonstrated that Nature throughout all her works reveals

herself in the character of a unity and a trinity—or two extremes *apart*, and a *union* of the two. So also we find *three* great religions with *one* common source—Jewism, Christianity, Mahometanism. Jewism is the parent of both. The first and third teach the distinct, undivided unity of God; the second, the unity and trinity combined. There are three distinct books, and three distinct sabbaths for the three. Wherever the unity alone is taught, therein general progress is at an end.—Stagnation is the character of the people and the church. Wherever the trinity is taught, there vehement action of the mind takes place, and the sciences generally progress. Man is male and female, and so are these great prototypes of the individual. The Jewish church is a male, characterized in an especial manner by the male rite of circumcision. The Christian church is uncircumcised—the bride that cometh out of the side of the man. Their first offspring is the Mahometan. But as all the religions of the world teach us that Nature brings forth two, first the evil and then the good, regarding the parental pair as the representatives of the male and female principle of Nature, and the Mahometan church as the first-born, we have a still a second-born to look for; the first is called the bond-son, the second the free; the first a bigot, the second universal in his views—all-embracing in his liberality and love. These three churches are one, having one common fountain—Abraham, i. e. the father of many people, a representative of Nature. He also had two sons, a bond and a free; the first was cast off, the second made heir of all. So it shall be with the old world and the new—the old is the theatre of corruption and falsehood, which enslaves man to his ruin; the new supersedes the old, and inherits all things in the enjoyment of liberty, having first reconciled the principal discrepancies of the human mind, and gathered the scattered fragments of truth together.

These are merely some of the rude outlines of the great science of Universal Harmony and Progress—a science which penetrates even unto the minutest ramifications of the courses of society, and discovers the resemblance which subsists between the collective and individual systems and organizations of Nature. We shall see more of them as we proceed. In the meanwhile some one may enquire to which party we belong—to the believer or the infidel. We answer, to neither; we are neither believer nor infidel, but both in one; and we yield to no one either in faith or universal liberalism. But these are virtues that may be inherited even by a fool; in so saying, therefore, we do not commend ourselves.

THE SHEPHERD.

MUSIC.

MUSIC has now become a science as well as an art. Its principles have been analyzed, and reduced by the demonstrations of arithmetic to the most definite precision. These demonstrations have revealed the secret, that sound is composed of primary divisions and subdivisions, analogous to those which we have already pointed out in other aspects of nature. The same family likeness pre-

sents itself; the same law of number, and numerical relations—in fine, the same law of universal harmony, which is never concealed from the enquiring and penetrating mind.

Music, like the rest of nature, is composed of two extremes; good and bad. This we all know too well, as our grating ears can frequently testify. But we do not all know that discord, or bad music, is an essential component of good music, *i. e.* that music consists of two opposite notes, namely, concords and discords, the judicious management of the latter of which constitutes one of the most difficult and important niceties of the art. The concords are seven in number, the discords innumerable, but seven only are useful and necessary accompaniments to the other. An octave, that is, a gamut, contains them all. It is called an octave, or eighth, because it counts from the first note of the one seven to the first note of the other, in the same sense as a week is called eight days. These concords are discovered in a very simple manner. Musical sounds are occasioned by vibrations of strings, &c., and these vibrations are more or less numerous in proportion to the length of the string, supposing the strings to be equal in thickness and tension; thus, a string of twelve inches has only one half the number of vibrations of a string of six inches; so that whilst the one beats two, the other beats one; and they go on in concord together. These two are perfect concords, for they never jar—the first always beats with the last, there is no discord. But suppose one string of twelve inches, and one of eight inches, which is two-thirds of twelve; then while the first beats two, the second beats three, and they unite at every third beat of the second string, and every second beat of the first string, which causes a coincidence and a noncoincidence alternately—a most pleasing composition, which musicians call a fifth, and the central of the three perfect concords. The largest string is called unison, or number one, the smallest the octave, the other the fifth. The other concords are less perfect; thus, a third minor only coincides at every sixth, a fourth at every fourth, a sixth minor at every eighth: these are imperfect concords. The discords coincide one at every sixteenth, another at every sixty-fourth, &c. This is the fundamental principle of harmony, and it is full of a three-fold character—but on this subject we cannot enlarge at present, but proceed to point out the resemblances between music and other departments of nature, which will rather puzzle those who hastily conclude, from the resemblance of two systems, that the one must be a copy and the other an original.

These seven notes are composed of five tones and two half-tones, or semitones, so that there are only five notes in all; but two are double; thus, octave or unison, 6th major, 6th minor, 4th, 5th, 3rd major; 3rd minor—five in all, corresponding to the five senses of the human body, two of which are double, namely, the eyes and ears, making in all seven—hence the vulgar numeration of the seven senses.

Again, we find seven primary colours in the decomposition of light by the prism; three of these colours are primary un compounded colours, and four are com-

pounds; 'tis the same with concords—three are simple, and four are compound, and the compound yet again divide themselves in the same way, three being what musicians call “arithmetical means,” and all the four “harmonical means,” leaving only one solitary individual which is not a harmonical mean. There is also a solitary ray of light, which is different from all the rest, that is violet; for all the rest are composed of two colours only, whilst violet is composed of three; and it has also been discovered that the breadths of the seven rays of light are in exact proportion to the lengths of the seven strings or notes of the monochord.

These are coincidences, and beautiful coincidences; and the more you examine Nature, the more you will see of them. She has contrived to give infinite variety in unison with the most perfect uniformity, and it is only the immensity of the variety that has prevented us from seeing the uniformity of the law by which she has been directed. But man has hitherto studied Nature in parts; he has never bethought him of gathering the fragments together. It was well to be so, however, for the parts could only be studied apart—they could not be compared until they were completed. But pray, what is the use of all this? you may ask; will it make us happier; will it improve our circumstances? Yes, for it is elementary knowledge of first principles which leads to most important results. You have never hitherto been taught first principles of general nature. Your knowledge, however great, has all been disjointed. You have looked at Nature divided, and thus yourselves became divided in consequence. Learn to unite Nature, and make harmony of her, and then you may expect to unite one another. But how can unity of mind take place without unity of instruction; and how can unity of instruction take place without a science of universal harmony; and how can you get a science of universal harmony by any other process than the simple process we now point out to you? If there is another process, we should like to know of it.

There are many other analogies, which we shall point out at another time, as we do not wish to confuse ourselves or you by too great a variety; and we have no doubt, that whenever the philosophical world shall take up this new and generalizing view of universal Nature, that they will shower down upon us like rain from heaven, and impart a totally different character to all elementary instruction and all philosophical enquiry. They require only to be sought after in order to be found; and when found, they will satisfy all but the idiotic or imbecile mind, that Nature is one grand unique system, arranged arithmetically and mechanically upon one original model, and that her minor parts are merely types or resemblances of her greater parts; that her collective systems and her individual systems are arranged upon the same principles, which principles, as soon as they are discovered and accurately ascertained, will forward the progress of learning more than any artificial system of education that ever was invented. At present, learning is so disjointed, the sciences and the numberless facts which appertain to them appear to have so little connexion with each other, that the memory cannot retain

them for want of some associations to connect them together. When such resemblances as we allude to are pointed out, they will not only be highly captivating to the young and ingenuous mind, but they will prove a never-failing resource for the memory, and enable it to embrace with accuracy and decision the whole panorama of nature. Learning will then be in tune, the music of the spheres and the elements will be known to all, and error will be as easily detected upon general subjects or principles, as the jarring of a discordant note is perceived by the delicate ear. We not only see the possibility, but we see the certainty, of attaining to this accuracy in the discrimination of truth and error. We have already discovered the fundamental principles of the science, principles which are as determinate in their conclusions as the discoveries of Guido Aretino, when he found out the seven concords, but infinitely more important, inasmuch as his discoveries only tended to give a sort of selfish or sensual enjoyment to the ear; ours address themselves to the whole man, and will ultimately bring forth concord of opinion upon all the systems and general proceedings of Nature.

This is all the music of the mind that we require, as may be easily demonstrated by the science before us. We have already said that it consists of concords and discords, and that the discords are essential to the production of fine music. We say the same respecting the music or universal harmony of society and opinion. It consists, and it is necessary for our happiness that it always should consist, of concords and discords; concord upon general or fundamental principles, and temporary and occasional discord upon minor particulars. This is obviously necessary for the progress of mind. We are ever learning, ever investigating; and as it is a law of Nature that we must gain knowledge by the labour of our minds, as well as food by the labour of our hands, it follows that we must always fall into errors first, and discover truths afterwards; for ignorance is our primitive state, and ignorance always misconceives and misinterprets, until it is removed by the light of experience. Hence men must always be contending, always discussing, always divided in part; but the difference between this division on particulars alone, and our present divisions, is, that now we differ on fundamental or first principles. Hence we are totally divided in interest and affections; we cannot co-operate; for one man looks at Nature and God with such a different eye from that of his neighbour, that they seem to be living in two different worlds, serving two distinct masters, whose existence is totally independent of one another. Now it is all discord upon general subjects; and any little harmony which we enjoy in the world is confined to very trifling matters, and subsists merely amongst a few friends and relations. The great sectarian divisions of mankind abhor the sight and the name of one another. They cannot appreciate each other's motives, or do justice to each other's intentions; for they do not breathe the air, or perceive the symphony, of the great world of Nature. Their vision is confined to their own little world; there and there only they see justice and truth; there and there only God delights to dwell; there, and there only, the Eternal smiles upon the select

little party, whilst he frowns on all the intellectual and moral universe without. Thus we are for ever reviling and for ever reviled by those whom we know not. We turn up the lip of contempt at them, and they return it to us with equal effect. We are all scoundrels to others, and they appear scoundrels to us. What is all this but the harshness of infinite discord, where the strings do not vibrate in coincidence once in a hundred? The greatest discord used in common music is once in sixty-four—but this is not music of which we speak.

As a proof of the general blindness of mankind to this doctrine of universal harmony, we may mention that the curious resemblance between light and colours has *actually* led some of our modern philosophers to imagine that there is *some* connexion between them. Wonderful! some connexion between sound and colour! some connexion between one part of nature and another part! some connexion between a part and the whole, between the right hand and the left, between the arteries and the nerves! Who could have imagined that wise men, philosophers, would only be imagining such a thing in the nineteenth century, when human society has advanced to the end of its first octave of millions of years? Sir Richard Phillips says that he has been "*led to infer* that sound and light are produced by different affections of the same medium. White light may be decomposed into three colours, and every sound is a compound of three tones. Atoms of oxygen and nitrogen may in *conjunction* produce one, oxygen apart another, and nitrogen apart a third. Both scales, too, are chemical, and are produced by the very atoms which produce all our chemical and electrical phenomena." He also informs us that oxygen presides at the red end of the scale of colours, and nitrogen at the other, in the very same proportion as in the atmosphere we breathe, that is, one to four. Now, were we to reason as we should do, we should not only be led to infer, but we should be certain, that Nature is one, and that all her phenomena are the offspring of one unity, or one medium by different affections. To tell us that "*both scales are chemical*" is to tell us nothing at all; it is to bewilder us—it is to make us imagine that there are some operations of nature which are not chemical, which is an absurdity, since there is none other but chemical action in existence. We once had a manuscript put into our hands to prove that life was chemical; to prove that white was white would have been equally important; but whilst the author attempted to prove that life was chemical agency, he would not allow that chemical agency was life, for he maintained that Nature was dead, and not alive—so we put his manuscript in a box, and there it lies as dead and not alive as his own God.

Chemical agency, or life, is the agent that does it all. To speak of atoms doing this, and atoms doing that, is only rendering darkness more visible; we may just as well talk of Morison's pills dancing a hornpipe, or holding a consultation upon the cholera morbus. Yet the atoms do it; but they do it by virtue of the male principle of life but which animates them. Am I, then, a materialist or spiritualist? neither; but both in one. Shall I divide nature, and break the body of Christ for sectarian-

ism again? When the sword was raised up against the shepherd, the sheep were scattered, and truth was broken into ten thousand fragments; but they shall be gathered again; "they shall come from the east and from the west, from the north and from the south, and shall sit down together in the kingdom of God;" they shall gather up the fragments and put them together; and men shall smell them, and taste them, and acknowledge that the fragments united are better than the hard bread. For how can Nature be studied unless she be divided? and how can she be known, unless she be united again? "This, my body, is broken for you; take and eat it;" and when ye have eaten it ye shall live; but you must eat the whole of it. Hence the beautiful doctrine of transubstantiation, which the Catholics do not understand. "Every man, to be saved, must eat the whole of his God"—and so you must—you must take in the whole of nature; not in parts, not disjointed; not a bone must be broken, otherwise you are a bigot, an outcast from the commonwealth of Israel, and a stranger to the covenant of promise. This is a type in the kingdom of error of a truth to be yet realized, and acknowledged by all. Error is the egg-shell of truth, but men mistake the shell for the chicken, and eat rotten eggs.

A YOUNG MAN FOUND AMONG WOLVES IN THE DUCHY OF HESSE.

PHILIP CAMERARIUS relates that, in 1544, a boy was found near Hesse, who had been carried away by wolves at the age of three years, and who walked upon all-fours. These animals, he says, had so much affection for this child, that they fed him with the choicest parts of their prey, and taught him to run, to such a degree, that he was able to follow them at full speed, and take the greatest leaps. The care which they had for his safety extended even to the minutest things; they had dug a hole for him to sleep in, they had lined it with leaves, and, to keep him warm, they all lay round him; so that this kind of life had such attraction for this young man, that he has since said, at the court of the Landgrave Henry, that he regretted the society of these animals, and would sooner return to them than live with men. The habit he had contracted of going upon all-fours, was so firmly enracinated, says Jean Jacques Rousseau, that they were obliged to fasten pieces of wood to him, which forced him to stand upright upon his feet. [This history in the larger part of its details appears incredible; so Camerarius adds: *mirum, si verum est*; wonderful, if it be true.] *Philip Camer. Horsz. Subcis. cent. i., p. 345*; after the additions, *ad Lamberti Schœnaburgensis, lib. de rebus Gestis Germanorum.*—*J. J. Rousseau Disc. sur l'Inégalité des Conditions parmi les Hommes, note 3.*

The same author says that, in the same year, a boy of twelve years old was found, and taken by some gentlemen in the Hartz Forest, in the province of Echzel; he says nothing of his habits or way of living.

A YOUNG MAN FOUND AMONG BEARS IN LITHUANIA.

In 1661, some hunters found, in the Forest of Lithuania, among bears, a child about nine years old. Valmont de Bomare, who relates this history, says that this boy defended himself with his nails and teeth

against those who took him, and that another young man who was with him escaped. They say that he was well proportioned, that his skin was fair, his hair blond, his physiognomy agreeable; but that he was never thoroughly tamed nor accustomed to dress and live as other men. [It is probable that this may be the same boy who was seen at Warsaw in 1669, and mentioned by Connor, *Evang. Med., p. 134.*] *Dict. d'Hist. Nat. by Valmont de Bomare, art. Homme Sauvage.*

Thirty-three years after, that is to say, in the year 1694, they caught, in the middle of a herd of bears, in Lithuania, upon the borders of Russia, another child, about ten years old, who was covered with hair and went on all-fours. He gave, says Condillac, no sign of reason, had no language, and uttered sounds which had no resemblance to the human voice. They had great trouble to tame him; and it was only by constant attention that he was made to hold himself upright, eat our ordinary food, and articulate a few words. As soon as he could speak he was questioned on his primitive condition; but remembered no more of it than we do of that which happened to us in the cradle. *Connor, Evang. Med. p. 133.*—*J. J. Rousseau Disc. sur l'Original et les Fondemens de l'Inégalité parmi les Hommes, note 3. Condillac Essai sur l'Original des Connaissances Humaines, p. 199.*

A YOUNG MAN TAKEN IN IRELAND AMONG SHEEP.

In the 17th century a boy was found in the wilds of Ireland, who eat grass and hay, which he chose by the smell. He was very agile and active; slender, tawny in colour, fierce in character; he was tamed with difficulty, and very late. Tulpius saw him at the age of sixteen at Amsterdam, and, according to his description, he had a flat forehead, the posterior part of the head elevated, throat large, tongue thick and fastened to the palate, and the hollow of the stomach enforced; which he attributes to the custom this young man had of walking on all-fours. Instead of an articulate language, he only made a species of bleating, which was owing to the extraordinary conformation of his throat. [Tulpius pretends that this boy was brought up among a flock of wild sheep in Ireland, but it is not very probable that there are wild sheep in that country.] *Tulpius Obs. Med., p. 131. Schreber. Hist. Nat. des Quadrupèdes, genre 1er. de l'Homme, p. 40.*

A YOUNG MAN FOUND AMONG OXEN IN THE ENVIRONS OF BAMBERG.

Philip Camerarius, an eye witness, assures us that he often saw at the court of Bamberg, towards the close of the 16th century, a boy who had lived among oxen, and who still preserved the habits of a savage life. He had an extraordinary suppleness in his limbs, and walked on all fours with great agility. In this attitude he would fight the largest dogs, and he attacked them with such intrepidity that he put them to flight. He was not, however, ferocious. We are ignorant whether he had an articulate language, and what kind of food he took.—*Camerar. Horsz. Subcis. cent. i., p. 343*

THE GIRL OF OVERYSSSEL.

In the month of August, 1717, a savage girl was found in a hilly forest near Kramenburgh, in the environs of Zwolle, in the province of Overyssel. She had been

stolen from her parents at the age of six months, and was nineteen years old when found, but we are ignorant how long she had been in the forest. Her skin was brown, rough, and covered with hair; her hair, long and bushy, floated upon her shoulders; instead of an articulate language, she made a kind of unintelligible stammering; she fed upon herbs and leaves, walked upright upon her feet, and wore a species of apron, of her own making, round her middle. Her disposition was savage, yet without showing any sign of ferocity; so they had much trouble in taking her. But she soon became tame. In the course of time she took much aversion to her former life, and a decided liking to the new one. They could not teach her to speak distinctly; she comprehended the signs which they made to her, could make a courtsey, and accustomed herself to work. She learned to spin; it was her principal occupation to the end of her days.—*Breslauer Sammlungen von Nund K. G. xxi. Versuch, p. 437.*

TWO BOYS TAKEN IN THE PYRENEES.

In 1719 two savages were found on the Pyrenees; they ran along the mountains on all-fours, and leaped from one rock to another like the chamois. Although this event is far from distant, and although they were found in France, we have no further details than those we have just given, and which J. J. Rousseau mentions in his discourse upon the origin and foundation of inequality among men, note 3.—*Schreb. Hist. Nat. Quadrup. genre 1er. de l'Homme, p. 41.*

THE BOY OF HANOVER.

A boy about thirteen years old was found, in 1724, near Hameln, in the open country. He was, except some tatters of a shirt, naked. His body was completely covered with filth; but when he was washed, his skin appeared glossy, very white, and marked with many scars. He had a fierce and haughty look, and was only restrained by threatening him with the rod, which he held in great fear. Afterwards he became milder, and allowed himself to be caressed by those who came to see him; but he preserved through his whole life such an antipathy to women that he trembled when they approached. He walked upright as other men, ran very quick, but climbed with pain and difficulty. His nose was broad and flat, hair short, curly, and stature small. His tongue, which was of inordinate thickness, seemed to be fastened to the sides of his mouth, which prevented him from speaking. He, however, made a kind of stammering when irritated. His hearing was the finest and most delicate of his senses. When he entered into the society of man, for some weeks he only ate fruit, which he chose with precaution; by degrees he grew weary of this regimen, and in the end lived upon our ordinary food. His voracity was so great that he is said to have eaten more than two men could. He jumped and performed many singular actions; he often kissed the ground, and threw kisses to the passers-by. The education which the king of England had given to him in London for two years, operated no change either in his disposition or talents. He, however, learned sufficient English to ask for those things which were necessary for his subsistence; his memory was very treacherous, and

nothing more could be taught him. He died in 1727.—*Breslauer Samml. von Nund K. G. iv. Suppl. s. 69. xxxv. Versuch p. 506.*

THE GIRL OF CHAMPAGNE.

Racine the younger, in a chapter entitled "*Notes upon the Savage Girl spoken of in the second letter upon Man,*" gives us a very detailed account, but sometimes little credible, of a girl about fourteen years old, who was taken, in the month of September, 1731, near the village of Sogny, twelve miles from Chalons, and who was afterwards known by the name of Leblanc. Racine has inserted in this letter not only what he learned from her, but what he learned from the public talk in the time she was found, and from persons who had seen her in the convent at Chalons, in Champagne. He begins by informing us that it has never been known from whence she came, or what was her precise age, as she had but a very faint resemblance of her first condition. The following is an abridgment of Racine's narration:—

"The servants of the castle of Sogny having seen in the night a species of phantom upon a tree in the garden heavily laden with apples, approached as quietly as possible to surround the tree; but, all on sudden, the phantom, who, for the first time, eat sweet fruit, escaped over their heads, and leaped over the garden-wall, and saved herself in a very high tree in a neighbouring wood. The lord of the castle had the tree surrounded by his servants and tenants; and many were needed, as the phantom readily leaped from tree to tree. They debated how they should make it descend: the lady of the castle, imagining that hunger and thirst would make it come down, had a bucket of water brought, and having by chance found an eel, it was shown to the phantom. It was the damsel herself who told me of this scene, saying that she felt herself strongly tempted, and descended half-way, but mounted again; at last she came down, and went to the pail to drink. They observed that in drinking, she placed her chin in the water up to her mouth, and swallowed the water as a horse; they caught her, and remarked that the nails of her hands and feet were long and hard, which gave her this facility of climbing: she appeared black, but the change of abode soon produced the natural whiteness.

"She was taken to the castle, where she seized at first the raw fowls that the cook was preparing. Not knowing any language, she articulated no sound, and only made a cry from the throat which was frightful to hear. She imitated the cries of some animals and birds; but I have not heard her say that she could imitate the nightingale. In cold weather she covered herself with skins, but in all times she wore a kind of girdle, in which she carried a weapon, which she called a butteris. This butteris, which was a short round stick, was the club with which she felled monsters. With one blow of it she could knock down a wolf; she told me that when, with this weapon, she had killed a hare, she skinned and ate it; but when she had run it down, she opened a vein with her nail, and drank its blood. The blood of animals, so strongly forbidden to man after the deluge, was her nectar, and perhaps gave her that strength and agility which

our food deprived her of. Her manner of pursuing hares was extraordinary; she has given examples of her manner of running; there scarcely appeared any motion in her feet and body; it was not to run, but to slide. Her method of walking overturns the reasoning of our paradoxical philosophy, which would have man go upon all-fours.

"She was equally agile in the water, in which she sought fish, which was a very delicate food for her; she could remain for a length of time beneath the surface; water appeared to be her natural element.

"We may readily suppose that it was not easy for the lord of Sogny to keep a prisoner who would neither dress nor feed as we do, nor remain in a room, nor sleep in a bed. Accustomed to sleep on the ground or in a tree, to eat raw flesh, and drink blood, she only wished to escape into some wood or river.

"When by degrees she grew tame, and had learned our language, after saying that she was ignorant from whence she came, never having seen, as far as she could recollect, any thing but forests, in which she had lived with a companion of her own age, she related how she lost her, which she afterwards told me.

"Both swimming in a river (the Marne doubtless), heard a noise, which caused them to dive. It was a fowler, who, from a distance, taking their heads for birds, fired at them. They pushed their voyage much farther; and, going out of the river to enter the wood, they found in the way a garland, for which they quarrelled, each wishing to make a bracelet of it. Our savage having received a blow upon her arm, returned it upon the head of her companion, unhappily so violently that, according to her expression, *she made her red*. Immediately, by that natural impulse which prompts us to aid our fellow-beings, she ran to seek an oak, and climb to the top, hoping, she told me, to find a gun proper to cure the evil she had just committed. I am ignorant what knowledge she had of this remedy. Having found it, she returned to the place where she had left her companion; she was gone, and she saw her no more. Some travellers, apparently, having found a dying girl, carried her to the village, where she died. I do not know if she was grieved at her loss. It was about three days after that she was found in the manner I have related.

"This news made a great noise at Paris, where for some time they only spoke of the savage girl which was to be brought to court; but as novelties are soon forgotten, when some other event becomes in its turn the subject of conversation, they soon ceased to speak of the savage. It is to be regretted that no rich, charitable, and patient person had a desire to take care of her; but perhaps they were afraid of having in their house a savage so savage. She was placed among the nuns at Chalons, owing, apparently, to the death of the lord of Sogny, as neither he nor his lady presided at her baptism some months after, having the administrator of the community for godfather, and the superior for godmother. This baptism was precipitate, but judged so necessary that she herself had no remembrance of it, having lost all knowledge in a sickness which made her life despaired of.

"The violent disorder by which she was attacked was caused by her change of life. Shut up in a room, obliged

to sleep in a bed, and live on the same food as we, she, who was accustomed to live in the free forests, on the fruits of the earth, and the animals of the chase, was seized with melancholy; and the frequent bleedings, which were thought necessary to tame her fierce disposition, brought on the loss of her health, freshness, and strength, which was so great that she has told me she overthrew six men who tried to enter her chamber, by throwing the door on them. When she was told that it was not proper for a girl to climb up trees, she ceased from doing it; but she was often tempted to return into the woods to live there alone; but her most violent temptation was to drink the blood of some living animal. She even acknowledged to me that when she saw a child, she felt herself tormented with this desire. When she spoke in this manner, my daughter, still young, was with me; she, observing some emotion upon her countenance at the acknowledgement of such a temptation, said to her, laughing, "*Do not fear, miss; God has changed me.*"

"She was still at Chalons when the queen of Poland, who was going to Versailles, stayed there, having the curiosity to see her. She was conducted to the queen, and, to give her an idea of her primitive condition, she made her ancient cry from the throat before her, and showed her skill in sucking all the blood out of a living rabbit. An officer of the queen, who had heard that she never would allow herself to be touched by a man, wished to put her to the trial. Her promptitude to repulse him, and the fury of her eyes, proved the truth of what he had been informed.

"From the convent at Chalons she was removed to the New Catholics at Paris, the ladies of which have always praised her character, only complaining of a certain melancholy, which often caused her to seek to be alone. This inclination for solitude did not hinder her from receiving the visits of strangers, such as mine, with pleasure, in which I have remarked that in relating with as much vivacity as spirit the little she knew of her history, her eyes sometimes changed, taking a singular motion, which was perhaps useful to her when in the woods while she was on the watch against approaching animals.

"It was during her stay at the New Catholics that the late duke of Orleans went to see her, and questioned her concerning religion. She spoke to him of her design of taking the veil, which was the cause of her removal to a convent at Chaillot; her failing health hindered her from putting her resolution into practice. I do not know where she is now; but I am assured that she is in want of nothing; her primitive condition, her spirit and piety, all plead for her."—*Poeme de la Religion, Paris, in 12mo., p. 302 et suiv.*

JOHN OF LIEGE.

Linnaeus and Schreber speak of a young man called John of Liege, whom his parents had lost at the age of five years, and whom they found sixteen years after. He had principally a very fine smell: by means of this sense he discovered in the earth those roots upon which he lived. It is said that by this sense he could distinguish the women who took care of him at a great distance.—*Hist. Nat. des Quadrupèdes, genre 1er de l'Homme, p. 41.*

THE GIRL OF KARPEN.

In 1767, some inhabitants of Frawmark, in the county of Hont, in Lower Hungary, on a hunting excursion, so obstinately pursued a bear of extraordinary size, that they penetrated into the most secluded parts of the mountains, where no one, in all probability, had ever been before.

They were astonished at the sight of human footsteps in the snow, and having followed the trace, they found, in a cave, a savage girl about eighteen years old, naked, stout, and robust, with a rough brown skin. Some violence was required to draw her from her retreat. She, however, neither cried out nor shed a tear, and in the end, suffered herself to be led away. They took her to Karpfen, a small town in the county of Altsohl, where she was placed in the hospital. They in vain offered her cooked meat; but she eat with voracity raw meat, bark of trees, and different roots. It is not known how she came to be left in these inaccessible forests, or how she had defended herself against the ferocious animals which infested them.—*Dictionnaire de Merveilles de la Nature*, tom. ii., art *Sauvage*.

The Savage of Aveyron in our next: we shall now conclude with

THE MAN MONKEY.

"BLUMENBACH succeeded in tracing to its origin the engraved representation of one of those wonders, and in proving that it was originally the figure of a monkey: transmitted from one author to another, and humanized at each step. Martini, in his edition of Buffon, took a plate from the 'Amoenitates' of Linnaeus, who took it from Aldovrandus, who took it from Gesner, who took it from a German description of the Holy Land, in which it represents a quadrumanous, or four-handed, monkey; which, with other exotic animals, was seen on the journey. This quadrumanous simia had been gradually transformed, by those who successively copied the engravings, into a human two-handed being."

There are oddities in the world, who, being sadly puzzled with the subject of the origin of man, surmount the obstacle all at once, as they conjecture, by supposing him to be a civilized monkey; but like the Indians who support the earth on an elephant, and the elephant on a tortoise, they are left in the lurch after all their heroism in leaping over the ditch. There is, probably, no fact within the circle of human knowledge more demonstrative than this, that every species of animal and plant is an original; and as for the wonder of the first, they who wonder at such a thing may go with their mouths open all day—for there is really nothing less wonderful. One man says "the first pair were made by God"—no doubt they were. Another says, "nay; Nature produced them"—no doubt she did: this man is also right. Another says "they grew from the earth"—quite right; so they did. Another says "he does not know how they came"—right still. But these fellows all fight and quarrel with each other. We have frequently heard two parties dispute whether it was God or Nature that made man. Formerly, also, the philosophers disputed whether we were descended from our fathers or our mothers. The two subjects are perfectly analogous, for what are God and Nature but the male and the female, the HE and the SHE of existence? Hitherto men have refused to marry them, and thus made bastards of themselves, and something worse than a bastard of their mother; but the mystic apostles of nature in all ages have told them that they shall never be free until a great marriage takes place and the bride appears; "behold the bridegroom cometh, go ye forth to meet him." Who leads forth the bridegroom? Faith. Who leads forth the bride? Infidelity. And where is the priest who shall marry them? There's the rub.

But we have lost sight of the man monkey. We observed that some people seriously resort to this notion in order to get rid of the difficulties attending the origin of man; for, with them, the reproduction of man is nothing if they could only get a beginning. They can easily

imagine how a child grows; one set of atoms go here, and form a heart; and another go there, and form a chest for containing the heart; and others go thither, and form a head; and some come hither, and form the feet; and there it's all done as easy as can be. But how a man can grow, puzzles them sadly; he must have been a monkey first. This is their reasoning, only they clothe it all in *philosophical language*; and then it is quite surprising how rational it looks. But the humour of the thing is, that they who talk so call themselves matter-of-fact men: they believe facts only, and reason from facts only. Can you conjure up to yourselves any facts that support them or their philosophy? Did you ever hear of a dog becoming a horse, or a horse an elephant, or a pea becoming a bean, a bean an apple, or an apple a pumpkin; or of one plant or one animal ever growing into another? We can raise mules, but they won't generate; we can graft one plant upon another, but it must for ever be renewed; temporary mixtures, and even everlasting varieties, may be created, but no new species; every species is an original. This is a fact; why then reason upon any other foundation?

Moreover, had there ever been any such transformations as those alluded to, geology would have discovered them; but geology refutes the absurdity, if it requires refutation. The organic remains of all eras and strata are quite specific in their character. Were it not so, how could the comparative anatomist determine to what species they belong? Man is only to be found in the modern deposits of earth and sand, and he appears at the first, as he now appears at the last. He came suddenly into being. Then some fastidious disputant replies, "he must have come into being by an effort of Nature." An effort of Nature! pray what is that? who ever heard of a tree making an effort to grow, or the wind an effort to be still, or the atoms an effort to dance? When will men cease to be contentious, and learn to speak and act like rational beings? They talk of Nature, forsooth, as if she was inferior to themselves; as if there was no intelligence in the universe superior to their own; as if that which planted the eye did not see, and that which formed the ear did not hear, and that which gives understanding to man did not know; and yet these philosophers purpose to enlighten the world!

TRAINING.—Lycurgus seeing a keeper teaching a bloodhound to follow in train, "Observe," said he, "what pains yonder master takes to make his servant useful and profitable for his pleasure; who would not then train up his son with diligence in the school of virtue, that he may be a profitable servant of the commonwealth?"

FEAR.—"The thing in the world," says Montaigne, "I am most afraid of is fear." We should take a prudent care for the future, but so as to enjoy the present. 'Tis no part of wisdom to be miserable to-day, because we may happen to be so to-morrow.

TO CORRESPONDENTS.

Philadelphos and One of the Unwashed were too late this week.

Much obliged to Mr. Dewhurst; shall be happy to hear from him.

All Communications to the Editor must be post paid.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Bready, Sheffield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 6.]

SATURDAY, OCTOBER 4, 1834.

[Price 1d.]

SYSTEM OF NATURE.

IN this chapter we propose to consider the two extremes, which generally go by the names of spiritualism and materialism; and we shall find that they are subject to the very same laws which govern all the rest.

Spiritualism and materialism are two words which express in substance the same meaning as faith and infidelity. The spiritualist maintains that the affairs of this world, or what he calls the course of Providence, are conducted by a spiritual or intellectual power, independent of and distinct from matter. The materialist, on the contrary, asserts that nothing else but matter exists, and that it is the sole moving power. These two parties constitute the two greatest religious divisions of society, and at present eye each other with considerable animosity. The one takes the side of God, and the other the side of Nature.

It is interesting to trace the history of these two sects in all ages, and observe their progress onward from the midnight gloom of credulity and bigotry, to their present labyrinth of philosophical confusion and universal apostasy. Which is the first in the order of time, is hard to say: they grew up together, most probably, and have gone arm-in-arm together down the stream of time till now. Materialism, however, soon gained the ascendancy, and spread itself and its infinity of deities and sacred rites over the whole habitable world. It manifested itself in the two different aspects of idolatry and fetishism. Idolatry paid homage to the organized being, whether living or dead, animal or plant; and fetishism rendered homage to unorganized matter, such as stones, rocks, rivers, caves, grottoes, &c.: hence the two doctrines, which went always hand-in-hand, embraced the three great divisions of nature, the animal, vegetable, and mineral. This faith and this worship were universal; but in the infancy of society, when men had no idea of the unity of Nature, they divided her into parts, and gave a separate, independent existence to each; and thus idolatry and fetishism became polytheism, which literally means *many gods*. Polytheism, therefore, is the infancy of materialism; and the materialist now holds exactly the same relative position to the spiritualist that the Gentile did to the Jew.

The other division, or pure spiritualism, has always been the smallest division. The Jewish church, if not the source, was at least the centre of it; the Jews were always distinct in this respect, inasmuch that they were generally reckoned atheists by other nations. This people decidedly abjured the worship of matter, and maintained that deity was spirit.

Thus the two parties stood when Jesus Christ, the representative of deity or nature, appeared; and he taught this new doctrine, that he, or in other words deity, had two natures, divine and human;* that is, spiritual and material. The Jews rejected this, for it was materialism; and the Gentiles received it for the same reason, for their previous faith had prepared them to receive it. Having got amongst the Gentiles, it soon became invested with the peculiarities of Gentilism; and instead of the heathen gods and goddesses, the holy mother Church canonized the saints and saintesses, built temples in honour of their name, raised statues and pictures to represent them, and taught her faithful children to bend the knee, and perform the same rites of adoration which their heathen ancestors had formerly done to the gods of antiquity. Even those who protest against this excess of materialism in faith, still hold it in part by their adoration of the god-man, or the material-god; the only difference between the various degrees of this Gentile faith being the quantity of matter which is deified. The one party says one human body, the other party says an indefinite number of human bodies. Still, however, the whole are more or less materialists, and genuine spiritualism is now almost wholly confined to the Jews and Mahometans. What is now called materialism is the third step, which deifies all nature, but regards it as an infinite mass of unintelligent matter, which acts by what is called necessity, and produces all the beautiful and skilful combinations and organizations of being, without being sensible of its own performances.

Here, then, we have three parties: first, the Jewish party, which spiritualizes the Deity, and will not associate a particle of matter along with him; secondly, the old Christian, which associates one or more little bits of matter along with him, but separates all the rest; and thirdly, the materialist, which materializes the whole of existence, but extinguishes the soul of the universe. The new Christian embraces the whole; it alone teaches that God is all and in all; but how few are to be found in its ranks! how few have sagacity enough to perceive that its doctrines are almighty! It alone is free from absurdity, or dilemma of any kind; it alone can stand the butt of all opposition.

* He is called the express image of the Father's person—*i. e.* soul and body, mind and matter; *consubstantial*, that is, the same in substance, a finite representative of the infinite Deity.—“I and my Father are one,” and yet “my Father is greater than I:”—a drop of water is the same in substance or one with all the water in the sea, but yet the sea is greater than the drop.

Let us take a general view of the errors of reasoning, which these parties are guilty of. In the first place, the spiritualist abstracts his God from nature; and therefore, he is obliged to admit of some other power in existence which is not God, but which does the work of a god by everlastingly doing unspeakable things, never slumbering, never sleeping, never weary. This power, whether he calls it nature or devil, or elk or fairy, it matters not, can act independent of deity. Thus the God of the spiritualist is only half a god; and hence arise the common forms of expression when any things singular has occurred, "Surely the hand of God is here," "This was no doubt a Providential occurrence;" which gives a locality or confinement to his existence and operations, even while they profess to believe in his omnipresence. Hence also arises the exclusiveness of faith. God gave this religion, but he is not the author of that; "this is divine, that is not divine; this is from God, that is from man;" as if that which was from man was not first from God.

Then, again, the materialist falls into the same blunder; for, in the first place, he speaks of a cause which is not intellectual, a thing that experience can give us no idea of, for every movement that we call our own is the result of our own feelings or volition; and hence we are bound from experience to conclude that every other movement in Nature is the result of her feelings or volition. Necessity has no meaning, unless you mean intellectual necessity, that is, wisdom. He speaks of the laws of nature as perfect, holds them up as models for men to follow, forgetting that men have always been following the laws of nature, inasmuch as there are no other laws to follow. But if the laws of nature are perfect, all their performances must be perfect also: this, however, he won't allow, for he asserts that all has been derangement hitherto in human society; that it would have been better if such and such had not been the case; that there had been no priests, no kings, no religions, &c.; and moreover, that these things were brought into existence without any end or purpose, and for no ultimate good. If you ask him what is the use of the heart? he says, for retaining and circulating the blood; the use of the bones? for supporting the body; the use of the muscles? for moving the bones; the use of the nerves? for moving the muscles, &c. Every thing is of use in the individual man; but make a step from the individual man to the great or universal man, the species, and then nothing is of use. What was the use of idolatry?—no use at all. What was the use of Judaism?—no use at all. What was or is the use of Christianity, or Mahometanism, or Savagism?—no use at all. Thus he reasons two different ways. His experience compels him to the one; in the other, he flies from the lesson of experience; and because his ignorance cannot point out the use of a system, he immediately concludes it is of no use at all.

Thus the materialist, or the infidel and the believer, reason exactly upon the same principles; for the believer rejects all religions but one, and in rejecting them he uses the arguments of the infidel, and comes to his conclusion—*no use at all*. The infidel only adds one more to the list of the believer's outcasts—uses the believer's arguments against himself, and comes to the same general conclu-

sion—*no use at all*. All men are infidels to each other: the Jew to the Christian, the Christian to the Mahometan, and the materialist to the Christian; and all are infidels in reality, for all are exclusive, all are limited in their views of nature. All belong to one school—the *exclusive system*. Therefore they shall all be condemned; for when the Son of Man cometh, and findeth no faith upon the earth, what will he say? St. Paul says, that "God hath included all men in unbelief, that he may have mercy upon all;" but that is too good a doctrine to be taught now-a-days, for neither *believers* nor *unbelievers* will believe it. Why? Because all men are *infidels*. There is no faith on the earth.

Both parties are bewildered; they are involved in a labyrinth, out of which there is no clue to guide them. They are both illogical, both inconclusive in their reasonings, and are doomed to everlasting bickering, everlasting disunion, unless they embrace the simple truth, which unites them both in everlasting love. Both have truth upon their respective sides, but neither will receive the truth of the other, merely because he imagines it overturns his own. Therefore, rather than reject a favourite truth, they reject a truth to which they have no attachment. Each is partial in his views, and consequently uncharitable in his feelings. Nature appears a chaos to his mind. He sees no connexion between the parts and the whole—between the past, the present, and the future—no plan, no system. His mind is eclipsed and straitened by his own philosophy, which leads him in a way so narrow that he cannot turn himself.

That matter exists few can seriously dispute; and that there is a spiritual power within it, by which its movements are caused, is equally absurd to deny. Without the matter, the power could not act—for it has not a patient to act upon. Without the power, the matter could not act—for it has not a cause to produce an effect. Hence the only philosophy which is unassailable by objection of any kind is that which combines materialism and spiritualism in one. Both extremes are wrong, as usual. "All judgment is given unto the Son;" that is, he who unites the two natures. Thus, even the words of Christ, which were accounted so hard a saying that many left him, become literally true—"Unless ye eat my flesh, and drink my blood, ye have no life in you." "Ye are the body of Christ, and the spirit of Christ dwelleth in you." "We are bone of his bone, and flesh of his flesh."

"All are but parts of one stupendous whole,
Whose body Nature is, and God the soul."

THE SHEPHERD.

A. B. C., A PLATONIC DIALOGUE.

(The Scene is in Chatterland.)

A. Must not a poor working man wish himself to the devil, when he thinks how he is labouring hard all the day long and gets so little, with scarcely a rag to cover his back, whilst so many a thousand blue and red coats consume the fruits of his labour in vice and idleness?

B. Why do you complain of the blue and red coats? Is there not another vermin which consume our labour: I mean the black gowns?

A. The black gowns, my friend, are the supporters of religion.

B. The blue and red coats, my friend, are the supporters of the state.

A. Pray, Sir, what is that which you call the state?

B. Pray, Sir, tell me, what do you call religion?

A. By religion, I mean the archbishops, the bishops, the deans, and prebendaries, their wives and mistresses; their legitimate and illegitimate children.

B. The state is the king's most gracious majesty, his ministers, his pensioners, their wives and mistresses, their legitimate and illegitimate children.

A. A most excellent state!

B. A most charming religion!

A. What you call the state, I should call a corrupted government.

B. What you call religion, I should call a corrupted church.

A. Our religion, Sir, is founded upon the holy writings.

B. Our state, Sir, is founded upon our most blessed constitution.

A. Say rather upon our blue and red coats.

B. Or rather upon the black and purple gowns.

A. But think for a moment of the eternal bliss which the church promises to the tithe and church-rate payers.

B. But reflect for a moment on the happiness which the government promises to its tax-paying liege subjects.

A. Fudge!

B. Nonsense!

A. Sir, you are an infidel.

B. Sir, you are a radical.

A. Wretched citizens!

B. Miserable believers!

C. Tut, tut! hold your tongues, ye fools, and listen to me! In a village in Hungary there lived two farmers, the drollest fellows under the sun. The one would not have destroyed one field-mouse if you had given him a ton of gold; the other would not have allowed a slug to be destroyed, if you had promised him the whole world. But the one who was fond of the mice saw perfectly the folly of his neighbour, and laughed at him; and *vice versa*. Unhappily, the schoolmaster had not yet been abroad. Miss Martineau and Company's moral checks were unknown among the mice and the slugs; and they multiplied so fast, that within a short time the labours of the farmers were entirely consumed by them.

A. Do you understand that?

B. Do you comprehend him?

A. Away with the slugs and the mice!

B. Away with the mice and the slugs!

C. Away with the vermin that consumes in idleness the fruits of our industry!

A. B. C. Amen!

PHILADELPHOS.

THE SAVAGE OF AVEYRON, 1796.

Three years and a half ago (in the spring of 1796), in that part of the forest of Caune called the Bassine, in the department of Tarn, a child was seen entirely naked, who fled from the approach of man. So unexpected an occurrence excited interest and curiosity: the next and

the following days, at the same hour, they posted themselves in the glades of the wood, watched with precaution, and saw the same individual seeking acorns and roots, upon which he fed.

This news circulating in all the country, some persons determined to go and seek so extraordinary a being. They met with him in effect; caught him after much trouble, on account of his agility; but he escaped immediately, and regained the wood. [Extract of the official report of Citizen Guiraud, commissary, near the canton of St. Africa, addressed to the Central Commissary, 1799.]

Fifteen months had already passed since his first evasion, when he was found in the same wood about the close of the year 1798, by three hunters of Caune. At the sight of them he ran, and endeavoured to climb up a tree [Letter of Citizen N., published in the Journal of Debates, 1799]; but this resource could not withdraw him from the pursuits of the hunters; they got him into their power, and brought him to Caune. From this period dates his entry into society, and the origin of the changes which have been successively operated in his manner of life.

He was in a state of perfect nudity when taken by the hunters; they provided him with clothes: he had only lived upon raw potatoes, acorns, or chestnuts; they gave him some rye bread, and taught him to cook his potatoes and other food at the fire.

Still liberty appeared preferable to this kind of life. He only stayed eight days at Caune, at the house of the widow with whom he had been placed, and he again escaped; but instead of flying into the woods, he wandered in the mountains, and overran the different villages of the country, making a circuit of about twenty-five miles. Yet, in the night, he was never seen in any dwelling; and he seldom stayed more than half an hour in the villages and hamlets he frequented. He lived this wandering and vagabond life more than six months, exposed to the cold of a most rigorous winter.

The weather for some days had been milder, when, on the 19th of Nivose, at seven o'clock in the morning, he entered the house of Citizen Videt, a dyer of St. Sernin, dwelling in a house about a mile from the town. His head, arms, and feet, were bare; the other parts of his body were covered with the tattered remains of an old shirt, which six months before was given him at Caune.

"We were soon informed of it in the neighbourhood, says citizen Constans St. Esteve, [Extract of the official report addressed by the Citizen Constans St. Esteve, commissary of government near the Canton of St. Sernin, to the central commissary, 1799,] and a crowd of people flocked to see the child, who was said to be a savage. I ran there immediately, to see what degree of credit was to be given to the popular noise. I found him seated before a good fire, which seemed to give him much pleasure, but showing inquietude at intervals, which I attributed to the concourse of people around him. I considered him for some time without speaking; I afterwards addressed him, and I was not long in perceiving that he was dumb. Soon after I thought he was deaf, when I remarked that he made no sign in answer to the different questions which I put to him with a loud and slow voice.

"I took him affectionately by the hand to lead him to my house; he resisted with effort; but my repeated caresses, and especially two kisses which I gave him, with a smile of friendship, decided him immediately, and he has since shown much confidence in me.

"Brought to my house, I thought he was hungry, and

I gave him something to eat. Whilst we were on the road they endeavoured to persuade me that he fed upon raw roots and vegetables. To assure myself of the fact, or to know his taste, I served him at once, in a large dish, with cooked and raw meat, rye and wheat bread, apples, pears, grapes, nuts, chestnuts, acorns, parsnips, and an orange. He took the potatoes with confidence, and threw them on the fire to roast; he afterwards examined all the other vegetables, smelt them one after the other, and rejected them. I then bade my servant bring a greater quantity of potatoes: he was delighted at the sight; took them with both his hands, and put them on the fire an instant after; he took them with his right hand from the middle of the live coals, and ate them all burning. There was no way of getting him to wait till they were cool, and he manifested the pain he felt in being burned by inarticulate and sonorous sounds, without being plaintive. When he was thirsty, he cast his eyes round him, and seeing a jug, without making the least sign, he took my hand in his and led me towards it, and struck it with his left hand as a way of asking for something to drink. Wine was offered him, but he refused it, with many signs of impatience at the delay I made in giving him water.

"His frugal breakfast over, he rose, ran towards the gate, cleared it at one bound, and in spite of my shouts fled so swiftly that I had much trouble to catch him. I led him back without his making any sign of pleasure or pain. He had already greatly interested me as an unfortunate being; I began to feel sentiments of another sort, those of surprise and curiosity. The refusal of bread, meat, the preference given to potatoes, a kind of agreeable sensation which he appeared to experience at the sight of the acorn which had been given him, and which he held in his hand no longer than any other objects, his satisfied air, which nothing troubled, except at intervals, although in the most absolute nudity, the dread of being deprived of liberty, made me conclude that the boy had lived from his tenderest years in the woods, a stranger to social wants and customs."

On the 20th of Nivose he was removed from St. Sermin, to the hospice of St. Africa. According to the observation of citizen Guiraud, at the period of his arrival, he was *really dumb*; that is to say, that he absolutely articulated no sound: fifteen days afterwards his tongue seemed a little loosened; he screamed.

Accustomed to bear all the rigours of winter in a very high country, [the highest point of this mountain, where citizen Mechain had established a signal in 1797, is 1284 yards above the level of the sea,] this child could not suffer any sort of clothing: he quitted them as soon as he was dressed, or tore them when he could not otherwise take them off. To cover his head, he wore a child's cap, which was fastened under his chin to prevent him from pulling it off.

When he arrived at the hospital, he showed much repugnance to sleep in a bed; yet he accustomed himself to it by degrees, and in the end manifested much pleasure when his sheets were changed.

He then fed on raw potatoes, nuts, and chestnuts: in the latter time of his stay he accustomed himself to eat soup with brown bread soaked in it; but in every case he took no food before smelling it after the manner of a monkey.

Though his existence during his stay at St. Africa was milder and less dangerous than that of the forest, yet he sought to forsake the society of men and return into the desert; twice he escaped, and it was only by great exertion that he was retaken. Citizen Nougairolles,

governor of the hospital, an eye witness, told me that, being pursued in the fields, and seeing himself on the point of being taken, he was observed to put his hands to the ground and go on all-fours.

The child had already been some days at the hospital, when the fame of his history spread throughout the republic, accompanied, according to custom, with the most extraordinary circumstances. Some affirmed him to be covered with hair like a bear; others that he swam and dived like a duck; and others, in short, that he jumped from tree to tree like a squirrel.

Many journals made mention of him, and all Paris discoursed of the Savage of Aveyron; but the central administration of the department had not, as yet, received any official relation of his history.

In my impatience to learn upon what foundation the popular noise rested, I went to the office of the central commissary on the 3rd of Pluviose; and although the weather was very bad, I offered to set out immediately for St. Africa, to see and examine this individual, whose fame flew into every part of the republic. Then citizen Randon, [now under-prefect at Millau,] zealous for every thing which concerns the public, wrote to the commissary of St. Sermin to have positive instructions concerning the child, and have him removed to Rodez if he were still in his hands.

He arrived at Rodez on the 15th of Pluviose last, at three in the afternoon, surrounded by an immense crowd of people, which gave him so much trouble that he bit indiscriminately those who came near him. Immediately the central administration wrote me a letter to request me to take charge of the child; and to procure him every thing he required till they had determined what should be done with him.

A short time after the minister of the interior gave orders to the central administration to remove the child to Paris, but important considerations engaged the administrators to defer this removal. We had not received any answer to the questions we had asked; we did not yet know what were the intellectual faculties of this individual, we knew not what was his origin, we thought some persons might perhaps come and claim him; and, in this case, not being able to describe him, how could we have proved his identity.

In effect, since that period, two unfortunate fathers, who had lost a child of this age, one at the time of the revolt of Lezore in 1793, the other at the siege of Toulon, came successively to examine him; but they declared he was not their son. [One of these unfortunate fathers is of Marvejois, the other of Toulouse.]

Conjectures upon his Origin.—According to some very recent reports which I have had communicated to me by persons worthy of credit, and the rumours which circulate in the canton of —, this child belongs to a person named D—N—, at M—. He is, they say, born of a legitimate marriage, but his inhuman parents have abandoned him for six years because he was dumb. They point out the place where he lodged in the night, and where he gathered leaves to make his bed. They know the fields and gardens in which he was accustomed to seek potatoes and turnips, and they indicate the oaks which furnished him with acorns.

Such is the substance of the information which we have collected up to the present time, of the origin of this unfortunate being. We have, in truth, but mere conjectures upon the place of his birth, and the causes which led him into the forest; but it appears certain that he has lived for some time in a state similar to that of a brute, as is proved by the reports of the commissaries of

St. Sermin and St. Africa, by the testimony of persons worthy of faith, and moreover by his own tastes, habits, and manner of life.

Exterior Conformation.—In his exterior, the child shows no difference which distinguishes him from others. He is about four feet high, and appears twelve or thirteen years old. His skin is white and smooth, face round, eyes black and sunk, eyelashes long, hair brown, nose long and a little pointed, mouth middle size, chin round, physiognomy agreeable, and smile graceful.

His tongue does not present any vice of conformation. The teeth of his lower jaw stand clear from the gums, and are yellowish at the base. All his body is covered with scars, the greater part of which seem to have been produced by burns. He has one upon his right eyebrow, another in the middle of his cheek on the same side, one upon his chin, and one on his left cheek.

When he is seated, and even when he eats, he makes a guttural sound, a dull murmur, and swings his body from side to side, and backwards and forwards, holding his head up, the chin protruded, the eyes fixed, and the lips closed. In this position he sometimes suffers spasms, a sort of convulsive access, which seem to announce some affection in the nervous system.

Sense.—All his organs are well disposed, and his senses in general good. Some persons suppose him to be deaf, because he does not turn or answer to the cries and questions which are addressed to him; but with a little reflection we may conceive that his ear, though perfectly conformed, is much less useful to him from the want of speech, which in man is a dependency of the sense of hearing, an organ of communication, an organ, in short, which makes this sense active; instead of which, in the present individual, this sense is nearly altogether passive, not being connected with speech.

The sense of smell is very strongly developed. Taste being an interior smell, and consequently more relative to the appetite than any other sense, we may conclude that this child has likewise a surer, finer, and more exquisite taste than a civilized man. This conjecture is founded upon his repugnance for certain aliments, and his natural appetite, which forces him to choose, without deceiving himself, those which agree with him.

A quick, clear, and distinct perception of objects depends upon the perfection of the organs of sight, and under this relation our savage has this sense excellent, as his eyes are well conformed; but as the judgments of the eye, relative to his nourishment, have need of being rectified by the olfactory organs, they cannot be a surety, or give a knowledge without the organ of smelling: so the sense of sight, considered as a witness, is more imperfect, or rather has acquired less perfection in this child than in an individual living in society.

In a man endowed with strong intelligence, touch occupies the first rank, as it is the sense most relative to thought and knowledge; but in a simple and almost imbecile being, who covets more than he knows, this sense must be placed in a lower rank.

This, then, is the order of the senses, as nature has apparently disposed them in this savage; smell is the first and most perfect, taste the second, or rather these two are one; sight occupies the third place, hearing the fourth, and feeling the last. His sensations follow the same order, that is to say, that he is more moved by the impressions of smell; and the greater part of his judgments and determinations depend upon these dominant sensations; those of the other senses being less powerful and numerous, are subordinate to the first, and influence but in a secondary degree upon the nature of this individual.

Privation of Speech.—Among the writers who have undertaken to discover in the human character its original qualities, and trace the line which separates nature from art, some have represented man in his primitive state as confined to a purely animal sensibility, without any use for those faculties which exalt him above the brutes, without any means of communicating his sentiments, and indeed deprived altogether of the voice and actions which are so proper to express his ideas: our savage justifies one part of these conjectures; he does indeed employ some signs, which he has acquired since he has been in society, to express his principal wants and the means by which they may be satisfied; but he is altogether deprived of the gift of speech, and can only utter inarticulate cries and sounds. Perhaps this is owing to some fault in the conformation of the organs of the voice; perhaps the consequence of the wound he has received upon the glottis: but even supposing that in some former period he might have spoken, it is certain that having lived for some time out of all communication with men, he would have lost the use of speech. A boy of California, about twelve years old, who had lived with his parents in a desert, having been found some years after, knew so little of his maternal tongue, very defective in itself, that all his knowledge of it was confined to a very few words. [Description of California, page 176.] Selkirk, the Scotchman, had forgotten his language, and even lost the faculty of speech, after passing five years alone in the island of Juan Fernandez. [Allgemeine Historie der Reisen.]

Instinct.—Given up by nature entirely to instinct, this child exercised but purely animal functions. He was unacquainted with our facitious passions, those wants of convention, which become as pressing as the natural wants: his desires did not overstep his physical needs. The only good he knew in the world was nourishment, repose, and independence. Age has not developed that impetuous passion which torments and perpetuates all animated beings: he has not yet proved the sentiment of love. All his sensations, then, have relation but to the care of procuring the food which is necessary to him, the charms of liberty, or the sweets of repose. If he manifest some ideas, their object is the means of discouraging his existence: if some principle of reason be discovered in him, it is only applied to his wants; if he appear to possess some trace of memory, he only exercises it upon his own preservation. The mind of a person deprived of all intercourse with others is so little exercised and cultivated, that he only thinks when he is indispensably obliged by exterior objects. The great fund of human ideas is in reciprocal intercourse.

His affections are as confined as his knowledge; he loves no one, he attaches himself to no one; and if he show some preference for the person who attends on him, it is the expression of want, not the sentiment of gratitude: he follows him, as he is attentive to satisfy his wants and content his appetite.

The most piercing shrieks, the most harmonious sounds, make no impression upon his ear, or at least he appears insensible to them, and shows no perception of the noise made close to him; but if a cupboard, which contains his food, be opened; if a nut, of which he is fond, be cracked behind him, this noise immediately strikes the organ of hearing, and he turns himself to seize it.

Food.—All those who examined this child at the moment of his entrance into society agree in saying that he had a very decided repugnance for bread and meat; and that he only eat raw potatoes, chestnuts, and acorns

during his stay at Caune, at the end of Messidor, 1797, he learned to cook his potatoes, and since then he never eats them raw. At St. Africa he first eat rye bread, soup, beans, and nuts.

In the first days which he passed at Rhodéz he ate only roasted or half-burned potatoes, raw chestnuts, and common nuts; afterwards he took a fresh liking to rye bread and broth. In Prairial he had so decided a taste for meat that he ate it indifferently, raw or cooked. The dishes he most likes at present are green peas, windsor beans, and walnuts.

This want of food, continually in exercise, multiplies his relations with the surrounding objects, and develops in him a certain measure of intelligence. His whole occupation at Rhodéz was to shell beans, and he performed this task with as much discernment as the most accustomed person. As he knew by experience that these vegetables were for him, as soon as a bundle of dry stalks was brought he sought a pot or a pipkin, and established the scene of his operations in the middle of the room. There he disposed of his materials as conveniently as possible; the pipkin was placed on the right, the beans on the left; he successively opened the pods one after another with inimitable suppleness of fingers; he put the sound beans into the pipkin, and rejected those which were mouldy or stained. If by chance a bean escaped him, he followed it with his eye, picked it up, and put it with those destined to be cooked. As he emptied the shells, he piled them orderly by his side, and when the task was finished, he poured water into the pipkin and placed it on the fire, the heat of which he increased with the shells he had piled up. If the fire were out, he took the shovel, placed it in the hands of Clair [the name of the person who took care of him, and who accompanied him to Paris. See Dr. Hurd's *Education of a Savage*;] making him a sign to go and seek it in the neighbourhood. Hardly did the beans begin to boil than he desired to eat them, and his solicitations were so pressing that there was no means of refusing him, and he greedily ate them half done as they were.

When he wanted his potatoes fried, for which purpose he chose the largest, he carried them to the first person he saw in the kitchen, gave him a knife to cut them in slices, fetched the frying pan, and pointed to the cupboard in which was the oil.

Towards the end of Ventose, a piece of sausage was given to him, which after his custom he smelt, and then greedily devoured it. The next day the captain of the auxiliary battalion of Aveyron, who dined in his apartment, made a sign to him to approach, by showing him a small piece of sausage which he had cut from a larger piece on his plate: the young savage drew nigh to take the piece which was offered to him; he took it from the captain with his left hand, and with his right dexterously seized the larger piece on the plate.

To see what impression the sight of the country would make upon him, I took him one day some distance from Rhodéz to the house of Citizen Rodat, at Olemps. All was disposed for his reception: beans, potatoes, chestnuts, and common nuts had been prepared. This abundance gave him great pleasure; and without noticing the persons about him, he seized the beans, put them into a saucepan, filled it with water, and put it on the fire. With the shovel he opened the cinders, threw some potatoes in, and retained the sister of Citizen Rodat to help him in his cookery. In waiting they gave him the nuts and chestnuts, but he soon required to be served with his beans and potatoes; and when his hunger was ap-

peased he carried away, in his petticoat, the remains of his food, went into the garden, and by a foresight common to all animals which are liable to want, he buried them in the ground, doubtless that he might seek them again in a case of necessity.

Since some time, on entering a kitchen, he is accustomed to hasten towards the fireplace or stove, and examine all the saucepans which are around it. He successively takes the lid off, and if he see in one or other any meat stewing, he soaks a piece of bread in and eats; but as the woman who has charge of him has severely repressed this act of gluttony, he watches the moment when she is occupied, and her back is turned, to dip the bread in the pan,—a thing which I saw him one day do five or six times following unperceived.

On our journey to Paris we took care to put in a knapsack a small store of rye bread, potatoes, beans, and nuts, thinking that either we should not readily obtain these things at the inns we stopped at, or that we should not always have time to cook them. The child, who knew that these things were for him, paid particular attention to the knapsack; he had it always by his side when he was seated, and when we changed coaches, or when we arrived at an inn, he stayed before the door, and would not enter into the house till he had been preceded by the dearest object of his affections.

The first time that we showed him a looking-glass, he immediately looked behind it, thinking to find the child whose image he saw. At the same time a young person who was standing behind him offered him a potato. In his impatience, to take it he put his hand towards the glass; but seeing that, instead of obtaining it he was farther from it, he, without turning his head, put his hand behind him, a little on one side, and placed it upon the hand of the person who held the potato.

Suspensions of Imbecility.—All these details, and many others which might be added, show that this child is not entirely deprived of intelligence, reflection, or reason; yet we are compelled to acknowledge, that in every case which has no relation to his natural wants, or to satisfy his desires, only purely animal functions are observable. If he have sensations, they can produce no ideas. He has not the faculty of comparing one thing with another. We may say that there is no correspondence between his soul and body, and that he reflects on nothing. He has consequently neither discernment, mind, nor memory. This state of imbecility is manifested by his regards; they rest upon no object. The sounds of his voice are discordant, inarticulate, and made both day and night. In his walk, he always trots or runs; in his actions, they are without aim or determination.

Character.—When he is flattered and caressed he is mild and complaisant; if a sign be made him to approach, he approaches; if the hand be held out, he advances his, but withdraws it quickly, like a monkey. On the contrary, when he is put out of patience, he shows motions of passion and anger, and he moves his arms, legs, and head quickly, places his closed hands on his eyes, and shakes his head with vivacity. He at the same time screams with despute, and sometimes bites with subtilty those who are the cause of his rage.

Regimen.—It would indubitably have been imprudent to reform too hastily the way of life he had contracted in the forests. A too sudden change might have caused his destruction, or at least destroyed his health, as it happened to the girl of Chalons. Consequently, since the 15th of Pluviose, he has, without constraint, followed his own inclinations and tastes.

Notwithstanding the liberty he enjoys, and the facility

of obtaining the food he is most fond of, he always endeavours to escape, and takes advantage of every occasion. When he finds the door open, his first motion is to fly. He has already evaded Rhodex four or five times, but happily he has always been caught—sometimes at a very considerable distance from the town. On our journey to Paris he also made many attempts, which did not succeed.

The presence of fire always causes an agreeable sensation in him; he moves his hands in sign of joy, laughs heartily, pulls his petticoats above his middle to feel the heat better. When he is called to with a loud voice, "Oh, the rogue!" he immediately drops his petticoats over his knees, but the next minute they are up again.

This eagerness to warm himself, and the pleasure which he shows at the sight of fire, caused me to suspect that this child had not lived, as was said, in a state of perfect nudity during a winter so rude as the one just past, for I could not conceive how an individual who had supported such rigorous weather could be so sensible to the impressions of heat; but the trials I have made have dissipated my doubts and uncertainty. One evening the thermometer being four degrees below zero, I stripped him naked, and he seemed very much pleased to be disencumbered of his clothes; I afterwards pretended to lead him into the open air; I took him by the hand, and led him along the passages of the school to the principal door of the buildings, and instead of showing any repugnance to follow me, he pulled me towards the door, from which I concluded that these facts were not incompatible; that he could be indifferent to the impressions of cold, and be pleased with the sweet influences of heat, since we see dogs and cats subject to the same habits.

He slept while he stayed at Rhodex in a very dry apartment, the casements of which were covered with cloth, as he had broken the glass. His bed was composed of some bundles of straw, and he had only a linen sheet for a cover, in which he enveloped his whole body. Light as was this covering, he was never cold during the rigours of winter, a fact which I ascertained by feeling his arms and legs, which I always found penetrated by a gentle warmth; I also observed that he slept with his two hands closed upon his eyes, and his knees against his face.

This series of facts and observations may perhaps appear simple and minute; but vast and brilliant delineations afford but vague and imperfect knowledge; whilst, on the contrary, trivial details furnish exact and precise ideas.

His sleep is very light, and he wakes at the least knock at his door. When the south wind blows, we hear him laugh heartily during the night, and make from time to time some sounds expressive neither of pleasure nor pain.

He commonly wakes at day-break; sits up in his bed with his head and the other part of his body enveloped in the sheet; he rocks himself for some time, and lies down by intervals till his breakfast-hour: in these moments, which may be called moments of recreation, he will neither get up nor go out of his room.

At nine, or thereabout, the door of his room is opened; he then goes into that of the person who takes care of him; rye bread, potatoes, nuts, chestnuts, green peas, and beans, are given to him. If the weather is cold, he warms himself, resting himself upon his knees as a monkey [now he willingly sits on a chair]; afterwards he goes to his room, where he remains till dinner time.

This repast, which he takes about twelve, is composed of soup with bread in it, sometimes a little meat, and sometimes potatoes or beans. Water is his ordinary drink; he has, until the present, refused beer and wine.

When, in eating soup, or by any other accident he

wets his fingers, or any other part of his body, he uses ashes in the place of a cloth to dry them; his instinct is sufficient for this.

Sometimes after dinner he is taken out to walk: in the winter he stays by the fire; but every day about two he eats some bread, chestnuts, potatoes, or greens. After this luncheon, when he has no beans to shell, he retires into his room, lies upon the straw, wraps himself in his sheet, and rocks himself or sleeps till six in the evening. Then he sups, sometimes on meat, greens, potatoes, or beans, which are put before him at every meal. Then it is bed-time; nothing can stop him; he takes a candle, points out the key of his room, and becomes greatly enraged if he is not obeyed.

He eats about two pounds of bread, as much of roots or greens, each day.

His winter dress consists of a shirt, a carmagnole, and a short petticoat, which reaches his knees. His feet and head have been bare throughout the winter; when he goes to bed, he takes his clothes off, and puts on those proper for the night.

This kind of life appears favourable to his health and development. He has grown much since his stay at Rhodex; his body is strengthened; and he has only suffered from an obstinate cold, or some other light indisposition.

When he arrived at St. Africa, he was accustomed to do his needs wherever he was; now, when he is pressed by necessity, he most commonly makes a sign for the door to be opened, and he goes out into the court, or the place destined to that purpose. He often coughs, but never spits.—*Translated from the French of P. J. BONNATERRE, Professor of Natural History, Aveyron.*

ETYMOLOGY.

ETYMOLOGY throws great light upon antiquity, when used with a skillful hand; but few are sufficiently moderate and unbiassed to make a discreet use of it. Hence, like many other of the sciences, it has incurred considerable odium merely by the imprudence and intemperate zeal of its own friends. The Greeks were most extravagant punsters, and they published these productions of their own ingenuity with all the gravity of Harlequin or Pantaloon himself. Indeed, whether they were serious or in jest it is hard to say. If they were serious, they must have been uncommonly ignorant; if in jest, they were as grave as monkeys with their burlesque. They were uncommonly vain, and seemed to think their own language the most ancient in the world; therefore all their derivations were taken merely from their own tongue, although the words themselves were entirely foreign. Dean Swift has written a most admirable satire upon this etymological foolery, in his essay on the antiquity of the English language, in which he shows that Archimedes is derived from the three English words, "Hark, ye maids;" for this old philosopher during his study was very much annoyed with the gossip of his maid-servants, and he was frequently in the habit of calling out, "Hark, ye maids, can't you cease your prattle!" And as he was in the habit of prefacing his complaint with the same three words invariably, they gave him the nickname of Archimedes. Alexander the Great also was very fond of roasted eggs, and it was his usual practice, when he re-

turned to his tent, to roar out, "All eggs under the grate." Hence arose the name of Alexander the Great; and hence also arises the proof of the antiquity of the English.

The ancient Greeks inform us that there was a set of people with dogs' heads, and another with no heads at all. Herodotus says so with great gravity, and he is the king of historians; and moreover we are told by Horus Apollo that these dog-headed people were kept by the Egyptians in their temples—that they could read and write—that they died piecemeal, and not all at once like other animals; and that they made water once an hour, or twelve times a-day, and this first suggested the idea of dividing the day into twelve hours. This ridiculous fable, however, is now very easily understood. The Greek word for these monsters is *Kunocephaloi*. The *Kunes* were the prophets or priests of the temple, as the Scholiast on *Lycophroz* informs us; and *Cephalos*, or *Keph*, or *Caph*, the rock on which the temples were built: the whole word in Egyptian referring merely to the inhabitants of the temple on the rocks, so built for astronomical observations. Moreover, the word "*ouran*," which means heaven, and refers to celestial observations, is as like as possible the Greek word "*ourein*," to make water, from which our word urine is derived. And as these celestial observations were made every hour, and reported or written in the books of the temple, we can easily interpret the ridiculous story of the "*Kunocephaloi*" making "*ouran*" once an hour. "*Acephaloi*," which in Greek means "without a head or heads," in Egyptian has the same meaning as the former. When Diodorus Siculus therefore informs us that at the great solemnity of Isis, the Egyptian goddess, dogs went in front of the procession, it is difficult to determine whether they were really dogs or priests. The prophet Isaiah also confounds the two; for he says the priests are dumb dogs and greedy dogs; and St. Paul very gravely exhorts the Christians to "Beware of dogs."

It is reported of Socrates that his usual oath was "by the dog and the goose"—a most ridiculous oath for so grave a philosopher; but the words "*kuna* and *chena*," which in Greek mean dog and goose, in Egyptian mean God and the Son of God, which transforms the oath of the philosopher from one of the most vulgar and contemptible to the most sublime and imposing which the human imagination can invent. Plato himself says that the "*chena*," or "*Cahen*," was an Egyptian god. The Greeks, however, studied no language but their own; they ascribed to every name a Grecian origin, and made up for the apparent inconsistency of their fanciful interpretation by some more fanciful and ridiculous fable. Many of our modern etymologists follow their example; and, by the help of a pretty large bump of comparison, continue to bestow upon words and things an origin as far from the literal truth as east is from the west. Etymology is a useful science when studied with caution and extensive information; but in the hands of a wag, or a bigoted partizan of any particular creed, it becomes nothing else than a burlesque upon literature, and an outrage upon common sense.

Our word "*sun*" is most probably derived from the old Babylonish names "*San*, *Son*, *Zon*, *Zaon*," which

mean the same thing; but still, the mere resemblance won't prove it, for, upon the same principle of reasoning, our word "*cur*," a dog, is derived from the Oriental word "*kur*," a title of the sun. And "*curtain*" might be easily divided into two words, "*cur*" and "*tin*," which mean an "*altar of the sun*," between which and the use of a curtain there is only a very far-fetched resemblance. *Chrus* and *Chrusaor* and *Chrisna* and *Christos* are all very like each other, and all titles of Deity; but if you merely infer from the resemblance that they are one and the same thing, you may also demonstrate that the sun is only a cur dog, or that a cur dog is the light of the world. But then, you may reply, it is also said of *Chrisna* he was born of a virgin; so is the sun, to which all these words apply, which is born twice every year in the two equinoxes, the houses of justice. In the vernal equinox, he "*rises out of the sea*," or the constellation of the fish, the fish's belly; in the autumnal equinox, he is born of the virgin; he comes out of the sign *Virgo*. But when you have discovered this, how far have you got?—have you demonstrated that there was no such being as Christ? Don't be so hasty: you have only got thus far—that there is a very curious resemblance between things in heaven and things on earth; but, more of this hereafter.

TWO BLACKS MAKE A WHITE.—When sal-ammoniac and quick lime, two substances destitute of odour, are blended together, they produce hartshorn, or the spirit ammonia, which has a very pungent agreeable smell.

ERRATA IN OUR LAST.—Page 33, first column, line 12, for *yields*, read *rejects*; and page 36, second column, line 53, for *doles*, read *does*.

TO CORRESPONDENTS.

One of the Unwashed in our next.

Such is the vanity, or the impudence, or the wickedness (excuse our want of charity) of some individuals, that they actually take the trouble of transcribing the beauties of our national poets, and sending them to the periodicals of the day as their own original productions. We have received several of these impositions, and heard of many more; as yet, we have, we believe, always been so lucky as to detect them; but if any should chance to escape our recognition, we should not be ashamed of the fact, inasmuch as we do not profess to be so universally read, or to be gifted with such extraordinary powers of observation, as to be able to expose every instance of literary plagiarism and imposture. Two pieces of very beautiful poetry have been sent to us this week as original; they are both copied from Lord Byron, and, as far as we remember, verbatim. We don't doubt that our two correspondents wrote the poetry; but they must allow that we are also right when we affirm that it was written, printed, and read over and over again before it ever captivated their fancy. Indeed, we wonder much that they ever conceived a relish for such refined sentiments.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 7.]

SATURDAY, OCTOBER 11, 1834.

[Price 1d.]

SYSTEM OF NATURE.

NATURE is generally divided into three kingdoms—the mineral, the vegetable, and the animal. The distinction is very well adapted for the ordinary purposes of language, but it is far from being literally correct. These three departments merge into each other so imperceptibly that it is impossible to draw a line of distinction between them. All attempts to give a characteristic definition of each have hitherto failed. It is not enough to characterize the vegetable by growth alone, for growth is a mode of existence which belongs to the mineral and the animal also. We have no better proof of the growth of the mineral world than the discovery of fossil remains of animals and plants in the hardest rocks; even live toads are sometimes found imbedded in the quarries, which could only have been secreted there by the circumstance of the solid material growing around them. Besides, we have numerous instances of rocks of several hundred feet in thickness growing in the course of a few centuries by the deposits of mineral or petrifying springs, waters which contain the oxide of iron, or the carbonate of lime, &c. What are all the strata which form the foundation of the soil which we inhabit, but vegetable growths upon a large and magnificent scale? There is no peculiarity in the vegetable or animal world, which has not something analogous to it in the mineral. To the superficial eye, in the general survey of the stratified masses which form the interior of our mountains, our valleys, and our plains, there is nothing perceptible but a heap of dreadful confusion, and lavish expenditure of labour, and deplorable loss of useful material. But the reflecting and inquisitive mind regards them with a very different eye. Every thing there is disposed with the same regularity, order, and utility, as the different functionaries of an animal or a plant. The strata, which lie in succession one over the other, instead of lying horizontally, which would render them inaccessible to human labour, are broken and inclined to the surface of the earth, in such a manner that the lowermost strata are frequently seen towering above the level of the soil; the beds of coal are all so conveniently arranged by means of dykes, or divisions that part them, that the pits, which would otherwise be completely flooded with water, are left comparatively dry, from the impenetrability of the solid clay of which the dykes that separate the coal beds are invariably composed; and all those useful materials in the bowels of the earth, which are the formations of myriads of years of mineral vegetation, are accessible to man only by the expenditure of a certain amount of

labour, without which it is an unalterable and judicious decree of our common mother that no great and important good be obtained. What is all this great process within the bowels of the earth, but a species of subterranean vegetation preparing for the use of the intelligent inhabitants of the earth—minerals, metals, salts, fuels, &c., of infinite variety, as the vegetable world is bringing forth food and other necessities and luxuries? The principal difference between the two kingdoms is this, that the vegetable world is more rapid in its process, and subject to frequent successions of growth, decay, and reproduction; whilst the mineral world is one eternal uninterrupted continuation of all the three in one: its spring, its autumn, and its winter are everlasting.

Vegetables are organized substances which grow upon the body of the earth, like down upon the human body. They receive all their life and all their substance from the soil, and contain no property which does not belong to the mineral world, into which they all dissolve again after a temporary existence. They are nothing else than the mineral world shooting itself up into the light of day, with an organization enabling it to ascend with rapidity, and develop its hidden beauties in all the multiplied varieties of trees, herbs, fruits, and flowers. They are still, in every sense of the word, a part of the mineral kingdom, have no consciousness of a separate existence, and no self-moving properties.

This peculiarity of *self-motion* is the characteristic of animals. Animals are “automata,” that is, organizations which possess the power of self-motion; and every organized being which possesses this power may be called an animal. But this definition, which is the nearest approximation to accuracy that we can attain, is not a definition which applies solely to what mankind in general call animals, for it also applies to the mineral world, which contains in itself the power of self-motion. Philosophers have in vain endeavoured to find out a definition of animal, which should exclude the remainder of nature, but they have always failed. They have ascribed this failure to the imperfection of the language, or the extreme nicety of the subject; but it is neither the language nor the subject which causes the failure, for it is not a failure at all; there is no generic distinction between the two, for both are animals, and the only difference which subsists between them is, that the one is a finite and dependent, the other is an infinite and independent animal. Nature is an animal, inasmuch as she is an automaton: she moves herself—there is no other power to move her. The mineral kingdom is Nature; and within herself she produces her *two* offsprings as

usual; the one representing death, the one extreme—and the other representing life, the other extreme. These two are vegetable and animal—mere representatives on a small scale of the different attributes, moral, intellectual, and physical, which their common parent inherits on a large scale. The three kingdoms, then, are merely our old acquaintances, Nature and her two sons, the *bond* and the *free*—the vegetable being *bound* to the earth, the animal roaming *free* upon it. These two are law and liberty, or, in the scriptural language, law and gospel; the one being a schoolmaster to lead us to the other, even as the vegetable world is a necessary process to lead to the animal world, for no animal can live upon any food which has not first experienced the process of vegetation.

We must not however be understood as asserting that a stone is an animal, for a stone is only a part of the mineral world; nor that the earth is an animal, for the earth is also merely a part; nor that the solar system is an animal, for that is but a mere fraction—a mere wart on the finger of Nature. What we mean by the mineral world is universal Nature, or the infinite universe. This is “the living God,” “in whom all fulness dwells,” “in whom we live, and move, and have our being.” This is only one single infinite Being; but finite animals are incalculably numerous; there are supposed to be four or five millions of species in this planet alone—the lowest species being by far the most numerous. But all these are merely parts of the one, being bone of his bone, and flesh of his flesh.

There is nothing more sublime than a general, all-embracing view of Nature, so far as our humble capacities can take it in; and in order to obtain a consistent view of it, we must contemplate the two extremes at one and the same time—the two extremes of great and small. They are both equally inconceivable to us, but yet it is quite possible for us to express ourselves upon the subject in language which is strictly correct, and involving no other absurdity than the immensity of the idea. Nature, though infinite in magnitude, is infinite also in the minuteness of her operations. Great as she is, she works with much smaller instruments and materials than we. When we mean to build a house, we go to a quarry, and cut out large masses of stone, for material to erect our buildings. We do it hastily, and really appear to be more active creatures than Nature herself, who built the stone—for the stone is literally built. She brought forth the material by a slow and tedious process—she wrought with individual atoms, laying one atom upon another atom, as we do with bricks, and taking myriads of years to accomplish the process of petrification. This to us appears infinitely tedious, for we are creatures of a day old, and a span long; but to Nature a thousand years are as a day to us, and millions of years’ incessant labour upon a single object is but a little agreeable recreation. We must not measure great things with small, nor infinite with finite, otherwise we merely bewilder ourselves in our own philosophy.

But unremitting and unwearied as Nature is, there is the most consummate order in all her productions; the three kingdoms, though they imperceptibly merge into each other, have each a distinct mode of operation. Thus we can say at once, when we see any object, of

whatsoever material it be formed, whether it belongs solely to the mineral or vegetable, or whether it has been the produce of animal labour.

The productions of man are as distinct as man himself. Were it not so, there would be confusion in Nature, and our judgments would be baffled in their investigation of facts. The nests of birds are equally specific, so that we can discover the species of the tenant by the nature of the habitation which it has formed. No art of man can vie with the productions of the vegetable world, which is equally original and exclusive in its manner of working. The mineral world only displays more apparent confusion because it is infinite in extent, and the mind cannot grasp and contemplate the whole at once; but there is a manner of working peculiar to itself (which we are in the habit of calling disorganization, because we merely view it in detached fragments), so that we can at first sight distinguish it from either of the other two. Were these distinctions not irrevocably fixed by Nature, the greatest disorder would prevail. Were the mineral department to build houses, hew wood, and make furniture, such as are fabricated by men, the progress of human industry would be stopped for ever. The evidence of the senses, the inductive reasonings upon observed facts and acknowledged premises, which now lead to such important results, would then be futile. If we found the ruins of a castle, a temple, or a city, we could not from such a circumstance infer that men had once dwelt on the spot; for it might be replied, that Nature had built it. The ruins of ancient pyramids and temples, the fossil remains of animals and plants, which are found in the rocks and deposits of the earth, would then have amounted to mere nothing as facts upon which to exercise the human mind, and develop its hidden faculties. But all these evils have been prevented, and prevented too by those very wise and judicious means which some of our modern philosophers allege as proofs of the insensibility and judicial blindness of Nature. What they call ignorance is the perfection of wisdom, the law of everlasting order, without which the mind of man could never be of any intellectual or moral benefit to him.

The three kingdoms, the mineral, the vegetable, and the animal, are one, inasmuch as the same substances belong to each, and the same animating power pervades them all; but they are all included in the mineral, which comprehends universal Nature. It may well be said of this trinity, therefore, as well as of every other, the first being the Father, the second the Son, and the third the Spirit of Life, “proceeding from the Father and the Son,” as the Athanasian Creed hath it: “The Father is made of none, neither created nor begotten; the Son is of the Father alone, not made, not created, but begotten; the Holy Ghost is of the Father and of the Son, neither made, nor created, nor begotten, but proceeding: the Father eternal, the Son eternal, the Holy Ghost eternal; and yet they are not three eternals, but one eternal.” This creed is perfectly applicable to the three kingdoms of Nature, only the old parson who wrote it understood it in a very different light. His was a grope in the dark; but his words are prophetic, and really not more mysterious than Nature herself. *THE SHEPHERD.*

GEOLOGY.

GEOLOGY is the science which treats of the interior formations and arrangements of the various materials of which the solid body of the earth is composed; and of late years it has attained so much importance and certainty in its demonstrations, as, notwithstanding its comparative novelty and infancy, to be almost upon a par with the other sciences. There is, however, much conjecture still mixed up with its interesting and convincing facts: its parties are actuated by divers conflicting prejudices, by which the simplicity of plain truth is for a time distorted, but many curious discoveries are thereby brought forth, which are indispensable to the final determination of its great fundamental principles. The strongest of all these prejudices, as usual, are religious prejudices, which, according to an unalterable law of nature, invariably stir up an equally powerful antagonist party, which goes as far to the one extreme as the old conservative party goes to the other.

Some of the early discoveries of geology alarmed the religious world as much, if not more, than the revival of the old Oriental system of the heavens by Copernicus, or Galileo's discovery of black spots upon the disc of the sun. It was quite enough that the Mosaic account of the creation was attacked in its literal sense, to stir up the pious zeal of the whole army of the church militant on earth. All the Christian world was drawn up in battle array against it, insomuch that only desperate individuals, men who had no character to lose, or did not care for losing it, had moral courage sufficient to express their belief that the internal organization of the earth presented abundant proofs of much greater antiquity than was generally ascribed to it. When the subject, however, was fairly started for discussion, the most absurd hypotheses were gravely maintained and propagated by both parties. Theories of the earth then poured out from the press in all directions; the one party endeavoured to demonstrate that all the geological phenomena of strata and fossils were accomplished in a few days by the all-destructive, all-dissolving agency of the deluvial waters; whilst the other party maintained that these phenomena were the effects of the tedious operations of ordinary causes for a vast succession of ages, to which some even went so far as to ascribe no beginning. Still, however, both parties were deficient of facts, which they did not seem disposed to collect until they had spent the energies of their imagination. It was not until the last century that the first important geological fact was generally acknowledged, namely, that the fossil remains of shells and bones had formerly belonged to real animals. The idea was first suggested by Fracastaro in the sixteenth century; but long after that it was maintained that they were merely imitations formed by the plastic agency of nature. This point gained, the next thing to determine was in what manner they came there, and what sort of animals they were. In the infancy of anatomical science it was impossible to ascertain the species, for the distinctive properties of each animal had not yet been sufficiently analysed; hence the large bones of the fossil elephant, rhinoceros, and hippopotamus, were frequently taken for human

bones, which confirmed the popular belief of the multitude that the human race had degenerated in stature. This accounts for the fabulous stories of human skeletons, thirty and forty feet long, found in morasses, peat-bogs, &c., the length of the body being calculated from the comparative size of the bone. Cuvier was the first to make an application of comparative anatomy to the examination of organic fossils, and then it was immediately discovered that the greater proportion of these remnants of a former world were the bones of animals now no longer in existence. This was one proof at least of a great revolution, which had swept away from the surface of the earth a great proportion of its former inhabitants. "It may be seen," says Cuvier, "that Nature every where distinctly informs us that the commencement of the present order of things cannot be dated at a very remote period, and it is remarkable that mankind every where speak the same language with Nature;" and again, "I am of opinion with Deluc and Dolomieu, that if there is any circumstance thoroughly established in geology, it is that the crust of the earth has been subjected to a great and sudden revolution, the epoch of which cannot be dated much farther back than five or six thousand years; and that this revolution had buried all the countries which were before inhabited by men, and by the other animals that are now best known."—*Theory of the Earth*.

Dr. Buckland has supported similar views in a very masterly and ingenious manner. His description of the organic fossils found in the Cave of Kirkdale, Yorkshire, contains an amount of circumstantial evidence as complete and conclusive as is to be found in the minutes of any science, which is not purely arithmetical and experimental. He concludes that the cave was inhabited by hyenas, at a time when elephants, hippopotami, &c., were the inhabitants of this island; that these were of a species not now extant in any part of the world; that the cave, which now opens into a quarry at a great distance from and height above the sea, was afterwards immersed in water, which left a deposit of sand, in which the bones of the animals, all broken and gnawed by the teeth of the hyenas, are now found in great abundance. He has compared the appearance of the fossil bones with the bones which had been subjected to the operation of the jaws of the same genus of animals which are kept for public exhibition, and found the resemblance to be perfect; even the dung of the animal was discovered, and at once pronounced to be genuine by the keeper of the menagerie. From all this, and numerous other striking facts, he concludes that the den was inhabited by these ravenous animals at a very distant period, when the climate of this country was much warmer than at present, and that they were suddenly ejected by some dreadful inundation, which filled up the cave with mud, and destroyed many of the then existing species. Nothing but a sudden invasion of the waters can account for the phenomena; for the bones seem to have been caught as they were left by the animal; and besides, the floor of the cave is smoothed and polished with their tread; whereas, if it had been forsaken for some time previous to the deposition of the sand, it would have been all rough and uneven with stalagmite, a kind of pyramidal crust which is formed by the dropping of

the water from above. This stalagmite is still visible, but it is worn by the feet of the animals. There are numerous caves in Germany full of the remains of bears and other animals, but principally bears; these are also all enveloped in deluvial soil, and seem to have been involved in a similar catastrophe; at all events, they have been submerged in water.

Now there is another party of geologists, who turn up the lip at the very mention of deluvial agency, and maintain that all things have been going on as now from the beginning, or from everlasting; but that the land and the sea are alternately changing place by a very slow and regular process, which is rolling the waters alternately from north to south during a period of 20931 years—moving during half that period in one direction, and the other half returning to their former position. This, they maintain, accounts for all the phenomena of bones and shells, valleys, pebbles, and boulders. We, for our own part, see the most convincing truths in both opinions: one, alone, cannot account for all the phenomena which present themselves. The sudden inundation of a universal deluge can never satisfactorily account for the beautiful, the regular, and the systematic depositions of strata; and their organic remains, rising up in succession one over the other, and giving ocular demonstration of a graduated scale of vegetable and animal creation, which could only have been produced by a long series of ages; ages, too, of alternate rising and falling above and below the surface of the waters. If the process was so slow and gradual as the one party would have it, such bones as are found in the Cave of Kirkdale, and other places, would be rolled and polished by the waters which would have washed them in the cave for hundreds of years, and polished them like ivory before they had buried them in the mud; and also deposited many shells, and other inferior marine animals, along with them. The other party, however, replies that the cave might have sunk, as many other huge masses of mountains and earth have sunk, into the bed of a river, by means of some internal convulsion of nature, and been raised again, after a long lapse of ages, by a similar process. This is quite possible, and in accordance with known facts, as Professor Lyell has shown in his excellent work on the *Elements of Geology*. Still, however, it is not to us so satisfactory an account of the *modus operandi* as the deluvial agency, for the whole catastrophe seems to have been the work of a moment, and to have swept away the whole race of animals, whose bones are found scattered over the whole island, whilst the living race is entirely extinct from the earth.

In respect to this redoubted deluge, which has caused so much jealousy and bad feeling between the two parties, we have only room for a few short remarks. The two extremes are much nearer than they seem to imagine; for that very party which prides itself most on what are called *physical* causes (an epithet which has no meaning, inasmuch as all causes are physical or natural) not only acknowledges the possibility of an almost universal deluge, but maintains it as an article of philosophical faith. Thus they say, that as the perihelion of the earth changes, the waters move along with it,

and, in the course of ten thousand years, the seas which now cover the southern hemisphere will then be rolled over to the north, covering all our present continents, islands, &c., but leaving exposed an equal proportion of land in the south, which is now submerged in the water; what is this but a deluge of the northern hemisphere, in other words, of the *Old World*? This, however, is done in thousands of years, not in a few days; but the possibility is all that we are speaking of; and any planetary or cometary agency, and a very little could do it, which would merely disturb the motions of the earth, and shift its poles, would flood the whole of Europe and Asia. This would be slow or rapid in proportion to the duration and power of the cause which produced it; whilst the recession of that same cause would reduce the waters, and restore them to their former level. We don't assert that such was the case; we only contend for the possibility of the thing, upon the admission of the party which scoffs at it. And this hypothesis is certainly not only more in consistency with the phenomena of the wreck of the old world, but is also in accordance with the universal traditions of almost all nations. These traditions are, no doubt, to be received with a considerable discount; but they are not to be totally rejected upon the authority of an immature philosophy, which pretends to read the book of ancient history by the insulated facts of an infant science, as a gipsy reads fortunes by the lines of the hand. History is to be corrected, not to be written by such means. We conclude at present with the words of Sir Richard Phillips: "If, then, the present mean depth (of the northern seas) is two miles, or 10,560 feet, the sea (by the process above alluded to) would rise 3,520 feet, and if three miles 5,280 feet; in either case leaving but five or six hills in Great Britain uncovered, and ascending a fifth or third up the sides of Mount Blanc." Sir Richard smiles at the idea of a flood, yet these are his own words. The more we see and know of men and science, the more we are tempted to believe that they fight for fighting's sake. They are quite as pugnacious as our ancestors were, only they have got another weapon, which is much more noble certainly, but hitherto has been very destructive in its effects. Man is a warrior by nature; we are told that the heaven of the ancient Scandinavians consisted in eating [and drinking] to excess, and then rising up and cutting each other to pieces. The Irish are proverbially fond of a spree, after a social glass.

SCULPTURE.

BELIEVING that the FINE ARTS form a subject of peculiar interest to the majority of your readers, I have sent you this paper, being the first of a short series on the history and art of Sculpture.

The origin of the beautiful art of Sculpture stands so very remote in the history of mankind, that it seems coeval with society itself. Wherever rational and educated man has discovered any remnant of the human family in a primitive and pastoral state, wherever he has had an opportunity of examining the untutored savage under circumstances the most dull, degraded, and un-

awakened; whether he has viewed him as the free, dauntless warrior, the bold and intrepid hunter, or the skilful and hardy fisher, still he has been able to discover, in a thousand varieties and forms, a feeling and a love of imitative art. In the sculptured war-club, in the carved hunting-spear, and the enriched canoe-paddles, we can discover the germs of art, the very same in principle as that which through time and education has bequeathed to civilized society the lasting and almost breathing forms of those conspicuous actors in the extraordinary drama of by-gone times; and although Sculpture has too often been forced to yield to the debasing influence of tyranny and oppression, although the chisel of the artist has too often been plied to give dignity and beauty to the archetypes of heroes and conquerors, men who, through being ignorant of the certain means of securing posthumous fame, have sought it in discord, war, and misery; still the talents of the sculptor have frequently been employed in their peaceable and legitimate avocation of preparing for posterity the dignified representations of the wise and virtuous, under circumstances the best calculated to improve the moral feelings of our nature; for the true end of Sculpture is to inspire our minds with noble thoughts—to give us the most affecting views of human nature—to touch and influence the tenderest sensibilities of the heart. With regard to the origin of Sculpture, many theories have been promulgated. It is more than probable, I think, that wood-carving was the first among the imitative arts that engaged the ingenuity of man. The representation of external forms in such a soft material as wood must have been easy, compared with the more stubborn materials of the earth. The near resemblance that some trees bear to the human figure might have first tempted the untaught hand of man to commence this delightful art, by merely cutting off the more superfluous branches, to make the form more natural and obvious. In this way might those mighty powers of the mind have been first brought into action, whose object it has since been to awaken remembrances of human actions and human suffering from the earliest times, to call up sensations of beauty or of awe in the human breast, to rouse the noble feelings of patriotism, gratitude, and friendship, beginning with less durable but more faithful memorials, and proceeding onwards by gradual steps from the little mound of earth bedecked with field flowers, the rugged moss-grown stone, the rude and scarcely visible representation of the human form, till arrived lastly at the colossal statue, with its gigantic proportions combining the noble qualities of truth, grandeur, and minute refinement; resembling more the spontaneous overflowings of inspiration than the laborious offspring of thought and science.

Egyptian monuments carry us to so early a date, that most historians make that country their starting point; the mysterious fabrics of Hindostan alone seem to claim an equal or more ancient date: hence there have been great controversies upon this subject, and many great men have contended that all arts have been derived from India, as their parent country. But careful observations of the works of ancient art will supply more rational means of decision than the dubious inferences of philo-

logical and antiquarian erudition, for the sculpture of Egypt, like its architecture, is massive, unpretending, and simple in its character and composition, compared with the more numerous and elaborate details of Asiatic art. But your space is too limited to permit me to go into this subject at present; my next letter will be strictly confined to EGYPTIAN SCULPTURE.

ONE OF THE UNWASHED.

DRUNKENNESS.

WE publish another extract from the Parliamentary Report on Drunkenness, as we know that the original is not accessible to many of our readers, although weekly abridged in Buckingham's Parliamentary Review, from which we have transferred it to our own columns. We do not venture to give our opinion at present upon the mode of legislation best calculated for the suppression of this degrading vice; but we are pretty certain that no local application can ever be successful in curing the evil. The evil lies in the general degradation to which the great mass of the people have been reduced by maladministration in every department of government; in the studied endeavours of our political rulers to put restrictions upon the free circulation of knowledge, and their indifference to the important task of providing rational and refined amusements for the public mind. Morals are not to be refined merely by severe prohibitory laws; the human mind is too ingenious to suffer itself to be drilled into a refined species of recreation, merely because an embargo has been placed upon those of a brutal description; the resources of vice are quite as exhaustless as those of virtue; and even ignorance itself is quite notorious for its inventive genius. The public mind can never be moralized until a more equal distribution of the rewards of labour be established, the education of the people become one of the most important concerns of government, and their amusements be regarded as subjects not only for political legislation, but the expenditure of the public money. Millions spent upon these two departments of moral government would not be expended in vain. The idle and the profligate, who now spend their evenings in low scenes of debauchery, acquiring in a few weeks or months habits which become a part of their nature, and drag them, reluctantly, through manifold wretchedness to an immature grave, might then be engaged in some innocent and virtuous exertion of mind, or enjoying with a light heart and pure conscience the ennobling representations of dramatic life, regulated by the universal principles of virtue which have obtained the sanction of the wise and the good of all ages and of all denominations.

You are a Police Magistrate?—I am; now of Great Marlborough-street, but twenty-five years previously at Union-hall, Southwark.

In the exercise of your magisterial duties, have you paid much attention to the connexion of drunkenness with crime?—The charges brought on Monday mornings far exceed the charges brought on any other morning. A great proportion of them are cases of drunkenness, and assaults, riots, and similar offences connected with drunkenness.

Do you impute this increased number of charges to the parties being in the receipt of money on the Saturday?—I attribute it to the gin-shops and beer-shops doing more work on Saturday and Sunday than on any other days in the week—selling more liquor.

Do you observe any change in the proportionate number of females who become drunk now, than in former times; is it more the habit of females to be found to drink to excess?—Whole families feel no shame in going into gin-shops, who, I am convinced, when I was first made a police magistrate, would have been ashamed of going into them, and misery has in consequence been produced to all the family.

Do they go in open day?—Yes, all day.

Among those families you include even the children?

—Yes; and mothers frequently give their children gin, and I have even seen children beaten when they refused to drink it.

Can you give an idea of the probable proportion which drunken cases bear to others?—The Metropolitan Police Report states it as follows for the last year: apprehended, males, 18,268; females, 11,612. Total apprehended for drunkenness, 29,880. To which in fact should be added, males, 3382; females, 5178. Total charges for disorderly conduct in the streets, 8560. (Nine-tenths of which originate in or about the doors of public houses.) As to the proportion which this bears to the whole of the charges enumerated in this Report of last year, the total is 69,959, in which is included the above 38,440.

It appears by a return made to Parliament that the number in 1831 of drunken cases was, males, 19,748; females, 11,695. Total persons, 31,443.

The number of persons charged with drunkenness before the magistrates, by no means represent the number of persons actually in a state of drunkenness?—Certainly not: it includes only a certain class, who are very troublesome when they are drunk, who cannot or will not go quietly about their business.

Have any remedies suggested themselves to your mind of a legislative nature, that can be at all applied to lessen the amount of the evil?—I think an encouragement to the drinking of tea and coffee, by diminishing the duties on them, would amply make up to the revenue for the loss on the sale of spirits, in due time, with much good to the morals of the poor. Formerly the magistrates made the licensed victualler produce his receipts of the quantity of beer and gin which he consumed in the house, from which they judged whether it was necessary to continue the same as a beer-shop, without which they could not get a spirit license; in fact taking away their license, unless a quantity of beer was drunk, and necessary accommodation afforded as a victualling-house.

Is it not true that houses where spirits are sold have greater indulgence in the length of hours they may keep open, than places where coffee is sold?—The coffee-houses and beer-houses are regulated by hours, the licensed house is regulated only by the words, "early and late," *i. e.* under no regulations as to hours.

So that, in point of fact, houses where the most temperate beverages are sold, are restricted to narrower limits than where the poisonous spirit is sold?—It is so.

Has it ever occurred to you to be obliged to punish a person selling coffee, for keeping his house open beyond the hours?—Frequently.

While you have never been called upon to punish a spirit dealer for so doing, there being no limit?—The keeper of a licensed victualling-house, or of the beer-shop, is convicted solely if drunken persons are actually found therein, as a disorderly house; drunken persons may be

round the door all night, but if not seen actually coming out of the house in that state by policemen or some witnesses, the keepers of the licensed houses and beer-shops will not be punished.

Are you inclined to think that poverty and want of employment are a cause of drunkenness?—I think some poor wretch may take to spirits to get rid of the effect on his mind; but it is more often a pleasurable excitement among a large class, who have neither poverty nor melancholy to drive them to such a course; this habit, if brought on in youth, increases with old age.

You think it is not a frequent cause of their being addicted to drinking, their wish to drive away care?—A few such instances there may be, particularly of poor women in that state.

Has it fallen within your observation to see the downfall of a class of men from a higher condition in life, gradually to a low condition in life?—I think I should enumerate the hatters as such, from their drinking.

The question alludes to the reduction of a large class of operatives from a state of good wages and prosperity, gradually lower and lower, till they arrive at a much worse condition from want of employment? Not often from want of employment; every distressed trade drinks much less when they earn less wages; that is a certain fact; they have not got the money to spend.

Sometimes it happens that the men receive only half wages, or wages insufficient to support their families; can you state whether, under these circumstances, they are as much disposed to attend to their domestic duties and the state of their families, or whether, from recklessness and despair, they plunge into these habits?—No, I do not think that they do, except the poor unfortunate prostitute. In a population of 240,000 in the Borough, I never observed that the males of a family drank, because they were on short wages or distressed. The weavers of Spitalfields, during the great distress, although their families were in a dreadful state of poverty, none of them were necessarily driven to drunkenness in consequence. Distress, I think, does not drive them to drinking as a general effect.—*Extract from the Evidence of Robert Joseph Chambers, Esq., before the Parliamentary Committee on Drunkenness.*

PHOSPHORUS.

PHOSPHORUS is a simple combustible substance, which was unknown to chemists till 1667, when it was discovered by Brandt, a German chemist, who kept the process a secret; soon after Kunkel found out Brandt's method of preparation, and made it public. It has ever since been known by the name of Kunkel's phosphorus. The appearance of phosphorus is that of a transparent substance, of a colour inclining to yellow, like clear horn; it is specifically heavier than water, is tough, and cuts like bees' wax, and like it melts with a gentle heat into a transparent fluid. With this heat it may be melted in water; but if the same degree of heat is applied in the open air, it melts, takes fire, and burns, producing a bright white flame with intense heat. Phosphorus should be handled with great caution, as should any of it adhere to the skin, or get under the nails, the heat of the human body is sufficient to inflame it. The process for obtaining phosphorus from bones was described in treating of the phosphoric acid.

Phosphorus seems to be almost universal in the animal kingdom, and is also found in some minerals, and in a very minute proportion in most vegetables. The bones of animals are a true phosphat of lime, or an earthy salt

composed of phosphoric acid and calcareous earth. The urine also contains a considerable quantity of phosphoric acid, chiefly combined with volatile alkali, but partly also with calcareous earth. This compound salt, afforded by the evaporation of urine, was formerly known by the names of essential salt of urine, or microcosmic salt. Brandt, Kunkel, and Margraff, and all chemists till lately, prepared their phosphorus from that substance, but it is now almost entirely obtained from bones, which afford it more plentifully and with less trouble. Phosphorus does not yet seem to have been applied to any important uses.

From the remarkable ease with which the phosphorus is inflamed, several experiments may be exhibited by means of it, which appear like the effects of magic to persons unacquainted with the nature of this substance. Thus, for example, if the outside of a bottle is rubbed with phosphorus, and then surrounded with tow, and hot water poured into it, the phosphorus takes fire, and communicates the inflammation to the tow. If a stick of phosphorus is used to write on a piece of paper, or on a wall, a quantity of phosphorus is abraded, and, undergoing a slow combination, renders the strokes visible in the dark, while in the light they can only be perceived to exhale a whitish vapour.

A fluid called liquid phosphorus is prepared by digesting some phosphorus in the heat afforded by horse-dung for two days, in oil of cloves, oil of turpentine, or any similar substance. After dissolution, the oil will be so impregnated with it, that when the vial is opened, it will appear luminous. Any thing moistened with this fluid will in the dark seem to be on fire.

Many natural phenomena, which in the ages of superstition served to astonish and affright mankind, have received a satisfactory solution from the discovery of the phosphorus of Kunkel. We learn from Fabricius *ab Aquapendente*, that three young men at Padua, having bought a lamb, and eaten part of it on Easter day, 1592, several pieces of the remainder, which were kept till the day following, shone like so many candles when casually viewed in the dark. It appears by his account, that the astonishment of the whole city was excited by this phenomenon, and a part of the flesh was sent to him, who was professor of anatomy, to be examined by him. He observed that those parts which were soft to the touch and transparent in candle light were the most resplendent. A philosopher of not less note has furnished us with a very pompous account of a similar phenomenon, which occurred at Montpellier in 1641. A poor old woman had bought a piece of flesh in the market, intending to make use of it the day following; but happening not to sleep well that night, and her pantry being adjoining to her bed, she observed that a quantity of light proceeded from the meat, so as to illuminate almost the whole place where it hung. We may easily judge of the terror and astonishment of the poor woman herself, since we find that a part of the flesh was carried, as a very extraordinary curiosity, to Henry Duke of Condé, who viewed it with the utmost surprise for several hours. The light was as if gems were scattered over the surface, and continued till the flesh began to putrefy, when it vanished, which it was believed to do in the form of a cross.

The attention of a more philosophic age was directed to experiments to ascertain the cause of this light. Mr. Boyle found that the light of rotten wood was extinguished in vacuo, and revived again by the admission of air, even after a long continuance in vacuo. The extinction of the light was not so complete immediately on exhausting the receiver, as some little time afterwards.

The wood was not much affected by condensed air; but the light of a shining fish, when put into the condensing engine, was rendered more vivid by that means. As air is therefore necessary to combustion, these experiments clearly indicate that this light is the effect of a slow combustion, or something analogous to it; and, indeed, the experiments upon the phosphorus of Kunkel have since placed this matter beyond a doubt. The combustion, however, in these cases, is so very slow, that no change of air appeared necessary for the maintenance of this light, for it continued for a long time, even though the wood was confined within a glass hermetically sealed.

To explain the cause of this combustion it is only necessary to repeat what has been just stated, that there exists in every animal body, and in most vegetables, a certain quantity of phosphorus. This principle, we have seen, is extremely active, and has the strongest tendency to unite with the pure part of our common air. During that separation, therefore, of the parts of bodies, which takes place in an incipient putrefaction, these phosphoric particles are detached from those with which they are combined, and by the action of the air a degree of combustion takes place, but so extremely faint, that light only is produced, without the least appearance of sensible heat.

This short explanation of the cause will, I flatter myself, correspond with most of the phenomena of this kind noticed by philosophers. Mr. Boyle found that the light of rotten wood was in most respects analogous to that of putrescent substances. The light of the former, however, differed in some respects; it was presently quenched with water, spirit of wine, and several other fluids; but the light of some shining veal was not entirely quenched by water, though its virtue was instantly destroyed by spirit of wine. The same philosopher was sometimes disappointed in his experiments on shining fishes; particularly he observed that they failed to become luminous in cold and frosty weather, which is perfectly agreeable to the nature of phosphorus, since its combustion is exactly in proportion to the heat which is applied to it. He remarks also in another place, that the light of shining wood was completely extinguished by extreme cold.

Some bodies have a much greater tendency to produce this light than others. A foreign philosopher remarked, that on opening a sea polypus it was so luminous as to startle most of the persons who saw it; the nails and the fingers of those who touched it became luminous also. The light of the glow-worm and other luminous insects must depend upon some slimy or fluid matter which they emit, and which is probably a combination of phosphorus with oil. There is a remarkable shellfish, called *phos*, which forms for itself holes in different kinds of stone. This fish illuminates the mouth of the person who eats it; and it is remarked that, contrary to the nature of other fish, which give light when they tend to putrescence, this is more luminous the fresher it is, and when dried its light will revive on being moistened either with salt water or fresh; brandy, however, immediately extinguishes it.

The luminous appearance of the sea in the night time cannot have escaped the observation of any person in the least conversant with that element. The light occasioned by the dashing of oars, or by the motion of the waves by night, is extremely beautiful. Father Bourzes, in his voyage to the Indies in 1704, remarked particularly the luminous appearance of the sea. The light was sometimes so great, that he could easily read the title of a book by it, though nine or ten feet from the surface of the water. Sometimes he could easily distinguish, in

the wake of the ship, the particles which were not luminous from those that were. The luminous particles also appeared of different forms; some appeared like points of light, others like stars; some of them resembled globes of a line or two diameter, and some appeared as large even as a man's head; they assumed square and triangular as well as globular forms; and not only the wake of the ship, but fishes in swimming, produce these luminous appearances. All these phenomena he attributes, and rightly, to the fat or putrescent state of the water, and observed, that when the wake of the ship was brightest, the water was most clammy and glutinous. In some parts of the sea, he saw a substance like yellow and red dust, and the sailors told him it was the spawn of whales which produced all these appearances. Later experiments have proved, that the luminous appearance of the sea entirely proceeds from the putrescent parts of marine animals.

Human bodies, as well as those of other animals, emit light just when they begin to putrefy; and the walls and roofs of places in which dead bodies have often been exposed have been observed to have a slimy matter deposited on them, which was luminous in the dark. The lights which are sometimes seen in burial grounds undoubtedly proceed from this cause alone. Similar appearances have been observed about the beds of sick persons, probably in putrid diseases: one of these was observed about the body and bed of a sick woman at Milan, which fled from the hand that approached it, but was at length dispersed by a stream of air. It is well known that the sweat often contains a considerable quantity of phosphoric matter; and the fact which has now been stated is strongly confirmed by a circumstance related by Henckel in his *Pyritologia*. One of his friends, who was of a sanguine temperament, had indulged himself in the exercise of dancing to such an excess, and his perspiration was so profuse, that he imagined his life in danger. While he undressed, traces of phosphoric light were seen on his shirt, and in those parts were a number of reddish yellow spots, exactly resembling the concrete phosphoric acid.

In all those animal exhalations which exhibit phosphoric appearances, the phosphorus in the state of a gas is mixed with hydrogen, and the compound is called *phosphorated hydrogen gas*. Of this nature, probably, are many of those phenomena, which are classed under the general name of *ignis fatui*, and of those which were described in a former volume as *igneous* or *luminous meteors*.—*Dr. Gregory's Economy of Nature*.

UNITY OF NATURE.

British Association; Fourth Annual Meeting, Sept. 1834.

An important discussion in the *Chemical Section* arose from the attack made by Professor Clarke, of Aberdeen, on Dr. Prout's account of the atomic analysis of carbonate of lime. Dr. Thomson ably defended Dr. Prout's views; he stated, that what is chemically designated an atom is, in fact, a congeries of atoms, for it was little short of absurdity to speak of the fraction of an atom. It was stated as Dr. Prout's opinion, that all elementary substances are multiples of hydrogen. Thus carbon, oxygen, &c., are, in reality, certain combinations of atoms of hydrogen. This singular theory has revived the popularity of the German hypothesis, first broached we believe by Kant, that every thing is eliminated from a common principle.—*Athenæum*.

From a little work just published, called, "Songs for the Many, by Two of the People."

LOVE.

God hath given me store of love;
All the things that breathe and move,
I love, I love.
I love the earth, I love the sky,
The sweets that bloom, the sweets that die,
I love, I love.
I love the trees, songs, birds, and flowers;
The summer and the winter hours,
I love, I love.
I love the fairies and the moon;
The balmy eve, the sunny noon,
I love, I love.
I love the sun, the brave, free blast;
Repose, and thoughts of trouble past,
I love, I love.
I love the rich, I love the poor;
The tatter'd beggar at my door,
I love, I love.
I love the friends of love and truth;
The friends of flowers and flow'ry youth,
I love, I love.
I love old age, infantine glee;
All earthly things have charm for me;
But most of all, whoe'er loves me,
I love, I love.

TO CORRESPONDENTS.

A Correspondent has enquired what we mean by Nature being possessed of intelligence. There is surely no difficulty in admitting such a principle, or even in regarding it as an axiom which requires no proof. Some truths are so self-evident that an attempt to demonstrate them only confuses the mind. We do not pretend to be able to comprehend immensity, but we think it perfectly possible to attain to something like consistency in the use of language and the rules of reasoning, and it is evident that nothing like consistency can ever be attained by regarding Nature as an infinite mass or promiscuous assemblage of unintelligent causes, moved they know not how, nor for what purpose. We can have no idea of motion or unity of action, without intelligence. We have no better definition of inertness or chaos than want of intelligence; and no better definition of order and system than intelligence. All we mean to say is that Nature as a whole is a self-organized and organizing being, both cause and effect, infinite and eternal, whose operations are conducted by the all-pervading power of a well-ordered mind. A man who reasons upon any first principle opposed to this will find himself miserably bewildered. The laws of Nature are nothing else than mental operations, and are unchangeable, only because that mind to which they belong is perfect in wisdom, and can meet with no accident or unexpected occurrence. All that is done is done by itself; hence it moves around the innumerable circuits of incessant action with all the precision of the most perfect clock-work. Thus all Nature is purely mechanical.

[Price 1d.]

SYSTEM OF NATURE.

LAST week we treated of the three great divisions of visible nature; namely, the mineral, vegetable, and animal kingdoms, and reduced them all to unity. Now we mean to take a survey of another threefold division, which results from the union of the material and intellectual world; namely, the physical, intellectual, and moral. The physical and intellectual are the two extremes, and the moral is a combination of the two in one. Still, however, the three are so intimately connected, that it is impossible to draw a line of distinction. The body and mind act and react upon each other; and every social or solitary act which we perform is a moral act.

The intellect is the great moving power—because it is the most subtle and intangible element of Nature. We have already observed, in a former chapter, that the greater the solidity of a substance, the weaker the active power it possesses. Solid rock and earth have no activity—water has much greater—air greater still—the more elastic gases still greater—and hydrogen gas, the lightest and most intangible substance in the material world that we can discern, is the most powerful element of matter. It is therefore in perfect “keeping” with this graduated scale of ascent to maintain that mind, which, whatever it is, and however incomprehensible, is an essential constituent of universal nature—is the great moving power of the system. This lays the foundation of a very beautiful distinction between mind and matter, which designates the one as the active, and the other as the passive; or *male* and *female*. This distinction, however, only serves the purpose of facilitating thought and perfecting language, since all Nature must, somehow or another, resolve itself into unity. Mind, so far as we can judge of it, is inactive without matter, and matter equally inactive without mind.

But if, as we observe, the mind be the only active power, matter may be denominated a passive power—it has the power of resistance. Philosophers generally call it by the name of inertia or inactivity, the very opposite of activity; but this very inactivity, or want of active power, is the means of modifying the active power of Nature, checking its ardour, and controlling its impetuosity; and by means of these two opposite extremes all the infinite variety of action observable in Nature is produced. Morality is the result of both. Morality means nothing more than the manner and purport of an action. Every movement of Nature, therefore, is a moral act. We are, however, generally in the habit of applying the epithet moral only to the actions of men, because other animals are incapable

of judging of the tendency of actions to produce good or evil, and are indifferent about it. This is nearly, but not altogether correct. When a dog leaps into the water to save a child from drowning, takes it by the hair of the head, and holds the head out of the water till it reaches the shore, what can we call this but a moral act? We have every reason to suppose that the feelings of the dog are precisely analogous to those of the man, who is prompted to do the same thing. The moving power is the same, but the organization of the dog is not fitted by Nature for being influenced by so many motives as the man, whose mind can retain more ideas, and foresee a greater number of consequences. The same difference might exist between two human beings; one of a very capacious, well-informed mind, the other perfectly illiterate and uninformed. This difference of intellectual character would make a similar difference in the moral character. In doing the very same kind of action, the one is innocent, the other guilty. By the progress of intellect, therefore, man becomes more and more responsible to society for his conduct, more and more refined and virtuous, yet more and more liable to infringe the laws of good morals; for these laws are always increasing in number in the same proportion as his mind is improving. There are thousands of little faults in refined society which are perfectly unknown and inconceivable to the rude and unpolished.

It is in this stage of our enquiry that we are called upon to examine the celebrated question of the “Origin of Evil.” This has puzzled the heads of divines and philosophers in all ages; and many have even gone so far as to assert that it is unintelligible to the human mind! Yet there is no subject within the whole circle of the sciences which is more simple and intelligible than this. We have read many dissertations upon the origin of evil, such as King’s, Edwards’s, John Calvin’s, Soame Jenyns’s, &c., but they all assiduously endeavour to involve the subject in mystery. The latter is nearer the truth than any of them; for he seems to have got some idea of the ultimate utility of evil, and hence imagines that it is not altogether inconsistent with divine goodness to permit it, &c. All, however, proceed upon the idea that there is some other than divine power at work to produce it. Their very first axiom is, “It cannot be from God;” and having adopted this, without even asking the reader’s consent, they proceed to build a hideous superstructure of mystery and absurdity. Evil is the bottom of the scale of intellectual and moral education; the beginning of the progress of mankind. We have already shown that the intellectual and moral characters go hand in hand; that less or more

of what we call virtue is expected in proportion to the understanding of the agent. When man therefore came into being, he came without experience and without knowledge; he had no memory of the past, and no foresight of the future; he had no idea of consequences; wisdom and folly were the same to him; he could not perceive the difference; his intellect was uninformed. But there is a portion of the mental character which requires little teaching; that is, passion or appetite. If this were as powerful as it now is, and with fewer restraints arising from experience of the past, it would necessarily lead to the most unfortunate results. Hence, as soon as man began to act, he began to sin, for ignorance always prefers the worst alternative. But as soon as he began to act, he began to acquire experience, or knowledge of good and evil: he ate of the fruit of the tree of knowledge, and is still continuing to eat. The sin and the knowledge came together; nor was it possible for him ever to acquire knowledge, but by coming through the ordeal of ignorance and immorality. All knowledge is acquired by experience, and ignorance and folly always precede experience. Hence he must fall before he can rise, or even walk.

But experience is of three kinds—physical, intellectual, and moral. Physical experience is bodily pain and pleasure; a knowledge of these is essential to happiness. Pain and pleasure are not two distinct perceptions, but one. We have not a nervous system for pain, and another for pleasure, but one nervous system for both. The one is merely the concord, the other the discord of the nerve; and there are some sensations, of which it is hard to say to which department they belong; tickling possesses the character of each; it makes us laugh and cry at the same time. Pain is merely an excess of sensation. To be unsusceptible of pain, then, would be insensibility to pleasure itself. They are two extremes, for us to balance when we have by experience attained to a scientific knowledge of their respective natures and causes. But before we can be thorough masters of evil, we must know it in all its infinite varieties; it must attack us with all the heads of the hydra; in other words, we must "*eat of the tree of good and evil before we can become as gods.*"

The same may be said of intellectual and moral evil. Intellectual evil is ignorance and error; moral evil is folly and wickedness, which are the consequences of error. All these lead man to wisdom, and enable him to appreciate the value of that which is really good. That which is applicable to individuals is applicable to the species at large, that "adversity is the school of wisdom and virtue." But there is a time for teaching, and a time for reaping the benefits of education. That time of reaping is the celebrated period of the redemption of man, so frequently predicted in all ages; of which poets have sung, and seers have spoken in the language of mystery; which the learned themselves have admitted into the number of probabilities; and which in these latter days is now preached in the spirit of enthusiasm by the two opposite extremes of spiritualism on the one hand, and materialism on the other. Where, then, is the mystery or difficulty of the origin of evil? It is intelligible to the simplest minds; the very children of future genera-

tions will regard it as the rudiments of education, and seriously enquire of mamma and papa what sort of men the present order of priesthood were, who neither comprehended the subject themselves, nor would suffer others to see it.

These three species of evil are so amalgamated with each other, that it is not only impossible to draw a line of distinction, but even to say which is the cause of the other—they all reciprocally produce each other. But there is more of the active cause in intellectual evil, or ignorance, than in the other two, for wisdom has power to remove them both. There can be no moral, no physical evil, where wisdom is perfect, for it teaches the means of curing the evil; the presence of evil of any kind, therefore, implies ignorance in the individual who suffers it. There can be no moral evil where there is no physical evil, for immorality is merely that species of conduct which creates evil. There can be no intellectual imperfection where there is no moral imperfection, and no moral imperfection where there is no physical suffering. Falsehood and error always disorder society, and bring sorrow to some one; truth reveals the cause of the evil, which is removed as soon as men are convinced of it. Truth, then, is the great reformer. The people can find no deliverance without it—their railing, their threatening, their violence, are all in vain. Success in such attempts at reformation would prove their ruin, unless they were so well informed as to agree upon the general principles of political and moral legislation. Are they so agreed? If so, they are ripe for salvation—and they shall have it instantly.

As Nature is a complete picture of herself, in whatever aspect you contemplate her, so we may expect to find a similar threefold character in the progress of society, as well as in the character of individual man. In the individual, the physical department is first developed. We were informed by M. Bonaterre, in his account of the Savage of Aveyron, that the sense of taste was most powerful, then the sense of smell, afterwards sight, hearing, feeling. Children have the sense of taste predominant; a sweet cake is one of the most powerful motives to stir them to action. It is only when the body and mind have come to maturity that the more refined stimulants of the intellect take hold of them. The caterpillar is a voracious insect, "all stomach," says De Tigny, "from the throat to the anus;" in the second, or butterfly state, the stomach dwindles away to nothing, and the animal devotes itself to the more refined pleasures of love. In the history of mankind the same general character is perceptible. The early ages were ages of splendour and magnificence, which eclipse the simplicity of later times, and cause us to dwindle into insignificance. The pomp and pride of ancient royalty, the strength and magnitude of ancient cities, the sensuality, martial propensities, and gymnastic exercises of the character and education of ancient nations, all accord with the general definition of the physical stage of the progress of society. The dawn of intellect arose with Socrates and Plato amongst the Greeks, whose philosophy has impregnated the whole of the civilized world. If we look at religion, the same progressive character appears. The

Jews were utterly devoid of philosophy; they merely waited, in idle expectation, for their great Messiah, who was to make them kings, and priests, and tyrants over the Gentiles. With Jesus Christ began the reign of metaphysics and intellectual warfare, which has sharpened the wits of Europeans, and given them a superiority over all nations of the world; but this has been carried to such an extreme as to reprobate all the pleasures of the body. "Mortify the flesh" is the old Christian motto, which, although it is by no means practised either by teacher or pupil, still pervades all the philosophy of the church, and perverts the judgments of its members. The third stage is the stage of sober sense, when men shall practise good morals, with minds well balanced and regulated by the discovery of the fundamental principles of truth, the first elements of the science of nature; when the pleasures of the body and the pleasures of the mind shall be weighed in the scales of justice, and found equal; when faith shall not complain of want of works, nor works call faith an hypocrite. Thus Jesus Christ says, "the kingdom of heaven is like unto leaven, which a woman took and hid in *three* measures of wheat till the whole was leavened." The third is the union of the other two, the period of our fondest hopes.

As an illustration of the tendency of all extremes to unite, we may here allude to the singular circumstance of the Jews with a spiritual God having one of the most sensual of all religions: almost every species of licentiousness was permissible to the sons of Jacob, and their expectations were equally unintellectual. Whilst the Christians, with their God-man, went to the opposite extreme, and indulged in spiritualities, until all Christendom became a raving bedlam. Each party still preserves its distinctive character, and abuses the other. Little does either imagine what large concessions it must make to the other. Each is blind of an eye; and so are all men. Therefore it is that they cannot conceive how one image only can be seen with two eyes—how the two sides of a contradictory doctrine can so intimately blend, like the two images of the two organs of vision, as to make one perfect doctrine; and how all the sectarian systems and fooleries of the species can be as easily arranged into one beautiful and consistent whole. It shall be our duty, however, to show them this simple truth, for without it all efforts at union, peace, and charity are but illusions of the brain. That department of mind which has ruled the world hitherto, must rule it for ever; we can reform, but not dethrone it. There never was a revolution in society which was not a reformation of the system preceding. Christianity is only Jewism spiritualized; Roman Catholicism is impregnated with Paganism; and Church of Englandism is impregnated with Catholicism. They all exist as before, only modified by the progress of mind, and are as indestructible as the atoms of Nature. They are the root, the branches, and the leaves of the intellectual and moral plant—the fruit is coming.

THE SHEPHERD.

HAIR.—A hair of the body is composed of many finer hairs bundled together; the same may be said of a spider's thread, which can even be separated with the hand.

GEOLOGY.

(Continued from our last.)

ABSTRACTLY considered, it matters very little to us whether there was or was not a deluge; but relatively considered, it is of very great importance, inasmuch as it is connected with opinions which have swayed the moral and political world for thousands of years, and whose dominion never can be destroyed, either by persecution or contempt. Viewed in this light, religion becomes a political question, and must continue to be so, even when the established church is no more. Every subject, therefore, connected with religion demands the investigation of every public-spirited individual, who ought not to be rash and superficial in his criticism of a system so universal and all-prevalent, but to ground his opinions upon positive facts and well-connected reasoning. No man can ever be an honest opponent who is not well acquainted with both sides of the question. We are very sorry to be obliged to say that neither party, neither the believer nor the infidel, is ingeneral acquainted with the other's views; and moreover, that they both invariably argue upon false principles.

In our last article on geology we ended with some remarks respecting the flood: we shall now continue the subject, and proceed from thence to the Mosaic account of the creation. Almost every nation of this, or any former age, has preserved a tradition of this universal catastrophe. The Chaldeans, the Egyptians, the Phenicians, the Greeks, the Persians, Indians, Chinese, Mexicans, Peruvians, and other tribes of America, Otaheitans, &c., all have a tradition of a great inundation, by which the whole world was destroyed, and a small remnant preserved. The greater part of them even mention the number, eight; which number the learned Bryant has shown to be the number of the primitive gods of Egypt, the chief of whom was carried in procession yearly in a ship called *Baris*. This festival of the ship was admitted amongst the Romans, and set down in the calendar for the month of March. Most of the old Eastern Pagan writers even say that the ruins of the ark were still in existence in their day, but that the neighbouring people were perpetually diminishing its bulk by abstracting portions of it, which they carried about their persons as charms; whilst Bryant, Faber, and others, have brought forth a host of circumstantial evidence to prove that the story of the flood was incorporated with the faith of almost every people of the ancient world. Make any allowance you please for errors of every description in this evidence, deduct even 90 per cent. if you will, and that is certainly a very extraordinary discount, still there remain 10 per cent. to surmount, with scarcely one plausible objection to enable you to take the leap. Hence, we conclude, that the evidence in support of the deluge, although merely circumstantial evidence, is as conclusive as circumstantial evidence can ever be: many are hanged for murder, or transported for theft, upon much weaker testimony.

[The first monarch of China, according to what is by some reckoned their true history, was Fohi, who had a serpent's head, and lived 21,000 years B.C. The second is Sin-Noo, 3,000 B.C., 18,000 years after Fohi. The third

is *Hoam-Ti*. Were we to judge by the ear, as many do, we would say these are the serpent, or first man, Noah, and his son Ham. The 18,000 years between Fohi and Sin-Noo, or Chin-Nong, as some provinces pronounce it, is the imaginary interval of unrecorded time, which we call the antediluvian period. The Indians make these imaginary periods much greater by converting minutes, or some small fraction of time, into years. Thus Albunazar, the Arabian astrologer, says that, according to the Indians, it was 720,634,442,715 days between the deluge and the era of Mahomet, which he says means 3,725 years.

Noo is quite the same as the Hebrew *Noe*, and *Nong* is merely the Chinese twang in addition. A cockney calls him *Noar*, for a cockney invariably puts an *r* at the end of every word that ends with a vowel. The law he calls *lawr*, he says an *umbrellar*, the tribe of *Judahr*; then again, he puts an *h* before every word beginning with a vowel; an *egg* he calls a *hegg*, and he calls the *hen* that laid it an *en*,—the Chinese would call it *heng*: no wonder, then, if they call Noah *Nong*; and what would a Yankee, a Low Dutch, or Welchman, &c., call him? Our readers, however, must not pay any attention to this note, the Chinese tell so many different tales.

Berosus, the Chaldean historian, says that Xisuthrus, in whose days the flood happened, was the tenth in descent from the first man; so says Moses; but Berosus says that between the first and the tenth there was a period of 120 *sari*, and each *saros* 3,600 years, in all 432,000. Suidas, however, informs us, that a *saros* was 222 lunar months, and says, 120 *sari*, according to the calculations of the Chaldeans, are 2,222 years. The Greek Bible makes 2,242 before the flood—difference 20 years. The Chaldeans, as well as other ancient people, called a day a year. Some nations made two in twenty-four hours; some made years of minutes, seconds, half-seconds, &c. Thus, the fourth great chronological period of the Indians, at the end of which the world is to terminate, is 432,000 years; now, according to the Indians, there are 60 hours in a day, 60 minutes in an hour, and 60 seconds in a minute, in all 216,000—this doubled for half-seconds is 432,000 years, as they call them! and before these, there was a period of 864,000 years again; but this last number is only the former doubled, or brought into quarter-seconds; so that these enormous periods are, after all, merely *one day*. Neither the astronomy nor history of any people can be traced 4,000 years back.]

We shall now see what geology says of the Mosaic account of the creation. Both parties, as usual, are full of inconclusive and irrelevant reasoning upon this subject. One says it is literally true, and the other says it is utterly false, and infers very frequently from this alone, that the whole Bible is false also! Such is the philosophy of the nineteenth century, such philosophy as that of Paine's Age of Reason, and the sermons and the commentations of the clergy, which all stand upon the absurd position that Nature cannot be the author of what we call error and deception! We say that it is neither literally true, nor wholly false, but just what it ought to be, a mixture of both, that is, a very correct and general, but allegorical, outline of the progress of Nature in creation. It is not

history, nor is it tradition, for no man could witness creation, and the professed character of revelation is parable or mystery. Hence, it is said of Christ, "Without a parable, spake he not unto them; that seeing, they might see and not perceive; and hearing, they might hear and yet not understand," &c.: let them find it out, it will do their eye-sight good to grope for it. As then it is neither history nor tradition, we are not authorized to receive it as a literal account of creation. But the general outline is correct: thus it begins with the mineral world, then proceeds to the vegetable world, last of all to the animal world, bringing forth the most perfect organization last, by a graduated scale of progression, corresponding with the discoveries of modern science, that "*no animal can live upon food which has not gone through the process of vegetation.*"

There is one very curious circumstance in this account of creation, namely, the creation of light on the first day, and the sun on the fourth. Moses was not such a fool as not to know that light came from the sun; so that this discrepancy, so far from deserving to be treated as an absurdity, ought only to be regarded as a proof that the whole story is merely an allegory. The greater proportion of the clergy have now abandoned this part of the literal meaning, and yielded to their opponents. They allow that the sun, moon, and stars were all created at the *beginning*, but did not make their appearance through the fogs, clouds, haze, &c., of the watery firmament until the fourth day, and that their *appearance* is called their *creation*. Very ingenious and very plausible. It certainly would have been very singular if the planet had been created before the centre of the system; but, by making this admission, they grant that there was *no creation* on the fourth day, only an appearance; and if so, why may not the same be said of all the six?

Another curious thing in the account of creation is the division of the waters on the second day. "Let there be a firmament in the midst of the waters, to divide the waters from the waters; and God made the firmament (atmosphere), and divided the waters which were under the firmament from the waters which were above the firmament." This looked very absurd until the modern discoveries of chemistry respecting the composition of water. Moses seems to have had an idea of an ocean above the clouds, whence the rain trickles down through a sieve. We know an old orthodox preacher who has this idea still, and who is determined to stick to the literal word as long as he lives: we asked him who held the sieve, he said it was the Almighty, "who else could?" But Moses is not so far wrong; we have no idea of the quantity of water which is contained above our firmament in the state of pure gas, hydrogen and oxygen, nor of the immense height to which these two substances can ascend. Hydrogen, the principal element in the composition of water, and, as some imagine, the only element in nature, is the lightest substance known; and we know from the barometer that the more moist the atmosphere is, the lighter it is—were it not so, the earth could not be watered from above. The possibility, therefore, of the earth being surrounded by the elementary principles of water to an indefinite extent, is not only admissible, but seems to be

the necessary result of many of the late discoveries in electro-magnetism. We can now, without any mechanical contrivance, produce a rotatory motion in a needle and magnet, resembling the revolutions of the planets; which makes it highly probable that there is an ethereal medium in space, through which the planets move, and from which they acquire their motion. Such are the speculations of philosophers of the present age, and the materialists are not the least eager to receive them. Here, then, we have the watery ethereal element, of infinite extent, the atmosphere beneath or within it of limited extent, and the water within the atmosphere more limited still,—all in different degrees of solidity. Now, this is the order of the Mosaic creation; afterwards, it is said, earth rose up out of the waters: this is a greater degree of solidity still: then vegetation arose, and this completes one series of creation, quite in accordance with modern philosophy. The second series begins where the first began, and may be called the series of life. We are taken back to the heavens again, and, first of all, the great lights and the smaller lights are presented as the celestial inhabitants; then the next in solidity are the air and the waters, and these are provided with inhabitants also; on the sixth day the earth is provided with inhabitants, and the seventh day is the Sabbath. This also agrees with the order of Nature, and with all the discoveries of geology, which, as yet, has discovered principally marine animal productions in the lower strata, and terrestrial animal productions in the higher: vegetables are to be found in both. In other respects the order is very vague: thus, there are more fossils in the argillaceous schist, which is the lowest in which such relics are found, than there are in the first red sandstone, which is considerably above it; there are vegetables in *lias*, which are wanting in all the secondary strata above it, &c. This much, however, is evident, that the first formations are marine, and afterwards they are marine, fresh-water, and land intermixed. All this is quite in accordance with the general outline of the Mosaic account.

But what are we to make of the days? Here geology and Moses are directly at variance. All known facts are at present directly opposed to the idea of a six-days' creation, and we believe the most enlightened men in the church have already abandoned it. A day, they say, is a period of time—a day for a year was common with the ancients—and the astrologers still calculate by that rule; and as a day is a type of a year, each being a *revolution*, which is the original meaning of the word "year," so also it is a type of any other revolution however great. This is quite correct. Isaiah himself speaks of a day which was more than seventy years; for he says, xxiii. 15: "In that day Tyre shall be forgotten seventy years." But what is to be done with the evening and the morning of such a long day? These are the beginning and end of the period, of course. But all this destroys the literal meaning, and the literal meaning *must go*, for it is quite contrary to nature to suppose that such a variety of materials containing the wreck of vegetable and animal existence, disposed above each other in beds some hundreds and thousands of feet in thickness were deposited all in a day, and that, too, in the very day on

which the animals were created; and no possible conception of a flood can account for the phenomena. Hence we are obliged to conclude that the period of creation, as it is called, occupied a long series of ages, and included a number of great and overwhelming revolutions, inundations, and convulsions.

So much for the Mosaic account, and that of its opponent. We have stated the argument as fairly as possible, and we believe we have done justice to both sides. We shall close this article by a few general observations.

Granite rock is the foundation of the crust of the earth as far as we have discovered it. In it, and a few more immediately above it, there are no vegetable or animal remains. Hence it is supposed by some that it has been subjected to the influence of subterraneous heat, which has reduced it to a state of fusion and destroyed all the remnants of organic life; but were this the case, we should meet with the higher orders of animals in the very first stratum where fossils are found; we do not—we find only the lowest, and as we ascend they improve in shape and intelligence; this seems to prove a graduated scale of creation from the lowest to the highest. This is according to the law of progress. This progress went on in the material, or what some would call the physical, department, until it came to man, and then a new species of progress commenced—the first was a progress from one species to another—now the progress went on in man himself, and will continue to do so for ever. It is a progress from the lowest species of intelligence and experience, to that state of intellectual perfection to which the human race is destined. The whole is a beautiful ladder of ascent, having two distinct departments, corresponding to the material and mental character of the universe. The intellectual geology is perfectly analogous to the other. In the lowermost strata of the earth there are no organic remains of any description, nor have we in like manner even one single remnant of the primitive ages of human society: as society progresses and intelligence increases, they begin to appear: we find pyramids, temples, cities, hieroglyphics, sarcophagi or tombs, of which we know quite as little as of the mammoth, the fossil elk, plesiosaurus, &c. By-and-by we find traces of true history, and can point out the various strata of political and religious institutions, all rising up one after another, till we come to the age in which we live and move; which is yet destined to transmit its memorials to future generations. These are always becoming more perfect as time advances, but not more monstrous; for as we find the greatest monsters in the primitive strata of the earth, so also we find the most huge and monstrous remnants of human workmanship in the earliest ages of the world.

The circumstance of no human bones having been found amid these relics of a former world, has induced many to suppose that man was not created till after the last great revolution. This, however, is rather a hasty conclusion: [There are some exceptions to this statement. In a quarry near Leipzig, human bones have been found twenty-six feet below the surface, and eight feet below the bones of a rhinoceros. There are some

other instances of a similar nature, but none are conclusive; besides, one or two solitary instances are not sufficient to establish so important a point.—*Buckland's Reliquiæ Deluvianæ.*] The researches of geologists have been confined principally to Europe and America. Asia, the cradle of the human race is as yet wholly unexplored. Upon this subject, therefore, we must be silent until we have got a sufficiency of facts to pronounce a judgment. We may safely say that man was last brought forth, but the researches of geology can go no farther. Tradition, however, supplies this deficiency in part by preserving the memorials of a tremendous and universal catastrophe, in which the human race as well as other animals was involved, and from which a remnant was preserved. Of the importance to be attached to this tradition we have already treated.

REGENERATING FABLES.

I.—THE OLD WELL.

Two ways the worldly-wise applaud
To rule mankind—by force and fraud;
And no two ways can be more sure
To make the evils they would cure.
To prove this proposition true,
Just any point of history view,
And you will find each government
Was on like policy intent,—
To shut out knowledge, and contrive
To keep man's vices all alive;
Thinking by craft to curb their courses,
And manage men like dunghill horses.
But they forget: vice never fails
To prove a cracker at their tails,
Which may not for a while explode,
But, when it does, they leave the road,
Rear up, and, cap'ring round and round,
Soon throw their riders on the ground:
No crackers are so sure to act
As vice, in ignorance thus pack'd.
But squibs and crackers, after all,
As similes, are much too small;
Statesmen, more bold in their designs,
Instead of crackers deal in mines;
Mines, charged with vice as ammunition,
Sending whole races to perdition;
Insidiously thus under-wrought,
And with combustibles well fraught,
A casual spark ignites a nation,
The mine explodes, and scatters desolation!
"Alas! what dreadful revolutions!"
"Alas! our precious institutions!"
They cry—forgetting Nature's laws,
That all effects must have a cause;
And that—this fact they cannot smother—
The faults of *one* produce the *other*.
In private life, too, it is so;
We walk before they let us know
That there are quagmires where we go.
Parents from children truths suppress,
Both miss and master should possess;
And leave them rambling to guess out
What they should know beyond all doubt;
Teach them to tremble, fib, and hate,
To keep them in a *quiet* state.
In fact, the bomb they prime and load,
Forgetting that it *must* explode.

'Tis time that mankind should grow weary
Of this hood-winking, blinking theory;
And here, perhaps, a fable may
Make clearer what I wish to say.

Near to the confines of a wood,
Poor Widow Dobson's cottage stood;
And, close beyond her garden paling,
There was a well, which had a failing:
It had run dry; half-choked with stones,
It seem'd prepared to fracture bones,
If any one should choose to jump in,
Or by blind destiny should plump in:
'Twas in a dark umbrageous nook,
And those who jump'd could never look.

The widow had of children three,
And finer ones you could not see.
The eldest, Bill, a boy of six,
Began to play off naughty tricks;
Display'd propensity to roam,
And scarcely could be kept at home.
His mother tried her utmost skill
To keep this active boy from ill:
His intellect outmarch'd her care,
And Bill was caught just every where:
She did, as some think mothers should,
Scolded and flogg'd him, for his good;
She loved the boy, e'en to an error,
And was in a continual terror
Lest he some accident should meet,
Which might her many cares defeat;
And what she dreaded most of all
Was, that he in the well should fall.

One law, laid down like law of Persian,
Had, therefore, cramp'd poor Bill's diversion,
That no one ever was to pass
Beyond her little homestead grass;
Or, if they dared, that she would take
Instant revenge, and, ruthless, make
(At such a threat who would not start?)
Scotch'd collops of a certain part!
And more, her doctrines to enforce,
To pious fraud she had recourse,
Until she scared them; she would tell
Of buggaboo, or giant fell,
Who always walk'd about the wood,
And pick'd up naughty boys for food.
"There, in that corner," she would say,
"Obscured by gloomy trees from day,
His castle stands; and it is paved
With skulls of boys who misbehaved."
This was to frighten them when playing,
Lest near the well they should be straying.

Sometimes, impell'd by other views,
She strove her children to amuse:
She told them tales of demons dire,
Whose nostrils pour'd forth smoke and fire;
Of giants of enormous limb,
Man-eating monsters, gaunt and grim!
For she, like graver teachers, sought
To mix with wonders what she taught;
She told them falsehood to despise,
And fill'd their little heads with lies.
Sometimes, when putting them to bed,
She "Jack, the Giant-killer" read;
Which sent poor Bill to sleep a-dreaming,
Or, if awake, to active scheming;
Putting his little brains to rack,
How he might imitate brave Jack:

He thought how happy he should be,
If buggaboo he could but see.
Suspended on the garden rails,
See-sawing, like a pair of scales,
He oft was seen, with curious eye,
Trying the castle to espy;
But, 'twas in vain; beyond his mark
The castle stood, and all was dark.

Those who know man, need not be told
That thinking *boldly* makes him *bold*.
Bill thought of Jack and buggaboo,
And every day more valiant grew.
One afternoon, when all was still,
Except the miller's wife and mill;
And nothing *stirring* in the house,
Not e'en the fire,—not e'en a mouse;
When every man was at his labour,
And Widow Dobson with a neighbour;
While all her little ones were sleeping,
Bill thought it was the time for peeping,
So, getting on the pales astride,
He look'd around, and dropp'd outside;
Peering about, cautious and slow,
With lion-heart, but pussy's toe,
Our hero ventured by degrees
To creep within the clump of trees.
He nothing saw—still on he went,
His soul on giants quite intent,
When two stray geese cried out "quack, quack!"
And sent poor Brennus scampering back.
He lost his way, with terror stumbled,
And plump into the well he tumbled;
He roar'd: two neighbours passing by,
By mere good fortune heard him cry;
They drew him out,—they home convey'd him,
And on his mother's floor they laid him.
At first, all terror and alarms,
She wept, and press'd him to her arms;
But when she found out, as she soon did,
Bill was not kill'd, but only wounded;
And that his wounds were only scratching,
Not needing but a few days' patching;
She then began that strain of reasoning
Which is of marriage term'd the seasoning;
That harrowing, *after-wise* reflection,
Which some say ladies in perfection
Keep always ready in their store,
As anodynes to heal a sore.—
I said not so, nor so have sung;
I libel not the female tongue;
That dulcet tongue *I* would not fether,
And think, so much we are its debtor,
The more the darlings talk the better.
But others other doctrines hold;
Some say that woman e'en can scold;
And widow Dobson's genius say,
I own, a little in that way;
At least her powers of *bland persuasion*
Were rather *loud* on that occasion.

When Bill had ceased to sob and sigh
He made this cogent short reply:
"Mamma, 'twas your fault, after all,
Which made me get this dreadful fall;
Of giants, wondrous tales you told,
And I much long'd one to behold;
I thought his castle was a sight
Which would my curious eyes delight;
But, had you told me of the well,
I never should have in it fell."

This tale is simple, but apply it,
And all mankind may profit by it.

First—ye divines, who never fail
To preach the devil, his horns, and tail;
Who paint him, like yourselves, in black,
And make a pulpit of his back;
Learn from this tale your fatal error,
Nor think to govern men by terror.
Your policy has this sad flaw—
What is familiar loses awe;
And talking much of old Paw-paw,
Emboldens some to touch his claw.
Man would not useful duties slight,
Or so confuse the *wrong* and *right*,
Could they obtain but *honest* teaching,
Instead of such *infernal* preaching.—
Turn a new leaf, then,—change the strain,
And teach us Truth in language plain;
Become the lamps to light our way,
Not goblin lights to lead astray;
Of Christ the moral axioms give,
And from *them* teach us how to live;
Teach us that acts of love insure
Those pleasures which alone are pure;
Do this,—the church's fears dispel;
We all shall love, and—pay you well.

Then next, ye statesmen, from this story,
Learn to obtain more solid glory;
Consult man's feelings and his reason,
Nor practise longer moral treason;
Lead man by either heart or head,
He very easily is led;
Lead him by both, he trots along,
And has no chance to wander wrong;
Over his eyes the blinkers place,
Stumbling, he cannot gain the race;
And urge him on by whip or goad,
Wildly he gallops o'er the road,—
But, the first time you let the reins out,
Most probably he'll—kick your brains out.

Lastly, unto my tale give ear,
And "ponder well, ye parents dear;"
Be not afraid of broad day-light;
It strengthens and improves the sight;
Your peep-hole boxes throw aside,
And open *all* your knowledge *wide*:
Your children should see *every thing*,—
Not only puppets, but the string.
Better to leave them quite in dark,
Than give them sunshine spark by spark.

L. P. P.

RESPIRATION.

WE convert the oxygen of the atmosphere into carbonic acid by respiration, and plants are continually decomposing this carbonic acid to feed upon the carbon. There are many other processes besides this, however, by which the air is purified. Carbonic acid gas is very destructive of life; hence the atmosphere of large cities, large and crowded assemblies, and ill-ventilated apartments, is not conducive to health.

"It is impossible," says Dr. Priestley, "not to observe the admirable provision in nature to prevent or lessen the fatal effects of putrefaction, especially in hot countries, where the rays of the sun are most direct, and the heat most intense. Animal and vegetable substances, by simply putrefying would necessarily taint great masses of air, and render it unfit for respiration, did not the same

substances putrefying in water supply a most abundant nourishment for this wonderful vegetable substance, (green vegetable matter which grows on the surface of water,) the seeds of which seem to exist throughout the atmosphere. By these means, instead of the atmosphere being corrupted, a large quantity of the purest air is continually thrown into it. By the same means, also, stagnant waters are rendered much less offensive and unwholesome than they would otherwise be. That froth which we observe on the surface of such waters, and which is apt to excite disgust, generally consists of the finest vital air supplied by aquatic plants. When the sun shines, this air may be observed to issue from them. Even when animal and vegetable substances putrefy in air, as they have generally some moisture in them, various other productions, in the form of mould, &c., find a proper nutriment in them; and by converting a considerable part of the noxious effluvia into their own substance, arrest it in its progress to corrupt the atmosphere."

FUNGI.

THE fungi possess considerable toxicological interest. They constitute a very numerous class of plants, amounting, all sorts included, to some hundreds. They are very extensively diffused, and are met with in every quarter of the globe. Pallas, who is my principal authority on this point, informs us that in many forest districts of Asiatic Russia, in which fungi abound, the people feed during Lent exclusively on bread and fungi, and that they eat all kinds, except the *Agrarius muscarius*, the fetid dunghill mushroom, and some other juiceless sorts, and we have it on good authority that in the Tuscan markets no less than 300 different species are found for sale; but the inferences to which these statements would lead are as much beside the mark, in all probability, on the one side, as the prejudices of the British public on the other; and there can be no doubt that amongst the most virulent vegetable poisons must be numbered a large portion of the mushrooms. After relating an instance of the death of a family, occasioned by partaking of a dish of carp stewed with some *Amanita citrina*, and of four French soldiers, who had eaten of the *Agrarius muscarius* near Potosk, in Russia, the lecturer states that the narcotic power of the *Agrarius muscarius* is illustrated in a very interesting manner by the accounts of travellers relative to the use of that fungus in the north-east of Asiatic Russia, as a succedaneum for the brandy, opium, &c. of other nations.

The *Amanita muscaria* is found principally in the vicinity of Wischna, Kamtschatka and Melkowa Derwna; it varies from one and a-half to five or six inches in diameter; they are gathered in July and August, and dried in the air. They are used in various ways, but principally in a dried state, in which they are rolled up singly into a bolus, and swallowed entire without chewing. One large fungus, or two small ones, are enough for one day's debauch. Drunkenness commences, as after wine, within the first or second hour after the dose, and with similar symptoms—viz. hilarity, flushed face, delirium, disposition to bodily motion, and, if the dose be very large, spasms; there is often great increase of muscular energy. The debauchee is sometimes observed to stride or leap over a straw, as if it were a beam; the drunkard sometimes so completely loses control over his locomotive powers, that under the exciting influence he is unable to stop himself, or to avoid plunging into any ditch, pit, river, &c., which may be in his way. While under this influence a Kamtschatkadale has been known to carry for fifteen successive wester a flour-bag weighing 120 pounds, and which when sober he could scarcely

have lifted. The fungus-like alcohol exposes the natural tendencies of the debauchee, causing the communicative to prattle, the musical to sing, and is a great betrayer of secrets, so that it would seem a well-known saying might, according to Langsdorff, be thus parodied, "In fungo veritas."—*Dr. Clendinning's Lecture on the Fungi.*—*Ryan's London Medical and Surgical Journal.*

TREACHERY AND CRUELTY OF NATURE.

THE leaves of the *Dionea muscipula*, or fly-trap, are beset with thorns, and their surface secretes a sweet liquor very attractive to flies. At the instant an insect touches the surface of this treacherous apparatus the two lobes of the leaf approximate, and the thorns, crossing each other, pierce the unfortunate animal in a manner analogous to that execrable engine of selfishness and cupidity, the man-trap. There are several other plants which have a similar mechanism. It is not the animal world alone which devours the animal, but life is assailed in a thousand ways both by the animal, the vegetable, and the mineral.

PIETY BEWILDERED.

MR. KIRWAN, the late celebrated philosopher and chemist of Ireland, is said to have maintained that inferior animals were incapable of sensation, that they were mere combinations of machinery, maintained in action by a perpetual miracle. He was led to this extraordinary doctrine in despair of otherwise reconciling the phenomena of the moral world to his ideas of the Creator. According to the reasoning of some of our modern philosophers, it would be difficult to prove Mr. Kirwan in error, for it is quite as easy to demonstrate the existence of intelligence as of sensation. This is only one of the innumerable dilemmas with which the false systems of religious and antireligious doctrines have bewildered the human mind. There is nothing more simple than truth; nothing more complicated and unintelligible than error.

A HINT TO THOSE WHO TAKE IT.

INNUMERABLE facts may serve to convince us that the mind cannot well attend to two or more sensations at the same time. "Hold your tongue!" said a Frenchman; "you talk so, I cannot taste my meat." The Frenchman was certainly in the right; for attention of mind is not less necessary to full perception than a healthy state of the organ of sense.

VEGETABLE OIL.—Vegetable matter consists of carbon, hydrogen, and oxygen. The sun's rays produce a disengagement of the latter principle in the form of vital air, and the two former are the constituents of oil. The old chemists used to think that the sun produced oil by furnishing the principle of *inflammability*!

EDINBURGH ASSOCIATION.—A letter was read from Prof. Quetelet, of Berlin, expressing his regret at not being able to attend. He stated that, in a new work which he is about to publish, he has reduced the theory of population to mathematical formulæ, and that the equations by which it is represented are very similar to those that express the planetary perturbations.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone; Exeter; Yates, Coventry; Baker, Sodbury, Worcester; Bready, Saffield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 9.]

SATURDAY, OCTOBER 25, 1834.

[Price 1d.]

SYSTEM OF NATURE.

THERE are some who say we are fond of searching after resemblances and family likenesses in Nature, and then very inconsiderately enquire what is the use of all this? If such people know any thing about science, or care at all about it, they must know and they must confess also that science begins and ends with this search, and consists of nothing else but the discoveries of *search*. It is by the discovery of such simple and all-prevalent facts that we come at last to confidence and certainty respecting the laws of Nature. Nor can any man be said to know any thing of Nature's elementary principles of action, until he has discovered and intimately perceives the truth of those fundamental divisions of which we treat. They are also exceedingly simple, and easily understood. They could not have been thoroughly comprehended, far less illustrated, before the present age; but now there are few so illiterate or rude of intellect, as not at once to understand them when pointed out with accuracy and simplicity of diction.

NOTWITHSTANDING the immensity of general information possessed by some individuals, and the smattering of almost all the sciences which is acquired by all the intelligent portion of the community, there are none amongst this great multitude who generalize their knowledge, and make it all converge in a focus. We have known many learned men, and read many learned authors, who wondered at the silly and unmeaning preference given by men in all ages to the numbers three and seven. They have called it a foolish superstition, absurd, nay even unnatural; for they regard it as an axiom that nature gives no preference to one number over another; and our modern popular philosophers have taken up the sneer which they have borrowed from the aristocratical party, and it has spread like oil upon the surface of water, till every man, for the sake of his reputation, is obliged in decency to sneer at this as well as a thousand other things, which he knows nothing of except as possessing a fashionable or a party interest. We hope to set all our intelligent readers right upon this and many other subjects. The numbers three and seven are the fundamental numbers which Nature employs in the composition of bodies, and a very few words will illustrate the truth of it. The two simplest, and consequently the two fundamental or primary figures, are a triangle and a circle; the one composed of a straight line, the other of a curved; every other figure is made up of parts of these. Now, supposing all Nature to be composed of atoms, it is evident that the smallest number which can compose a

regular figure is three. Take three sixpences, and place them on the table so as to touch each other, and you find that there is no possibility of making any other figure than a triangle. Then again, take seven sixpences, and place one in the centre and six around it, and you find that the seven form the figure of a circle, and no other number but seven will accomplish it. A square is generally accounted a fundamental figure; it is composed of two triangles, and in that sense it is not fundamental; but as they are not equal-sided triangles, it becomes entitled to the name of a primary figure. This can only be formed by four atoms at the least; but they are very differently arranged, being placed in rectangular rows. Four therefore is next in order to the three and seven, and there are only these three fundamental figures.

THese simple facts may be illustrated by many of the sciences; but we cannot in this short and simple outline give a great variety of detail, neither are we disposed to enter very minutely into the subject, until the general idea is conveyed to the minds of our readers, and sufficient interest is excited to seek for further information. Those who are eager to obtain it, however, will find it abundantly in every department of Nature. Let them merely apply the rules which we give them from time to time, and they will find all Nature combine to confirm them. These few observations upon numbers and figures are very beautifully illustrated in the science of crystallogogy, or the formation of crystals, where we see Nature arranging her atoms in the manner we have described, and forming the most beautiful triangles, rhomboids, squares, trapeziums, &c., so perfect that when you cleave the crystals even by violence, they naturally break into one or other of these figures, with smooth and polished sides.

WHEREVER we cast our eyes upon Nature, whether we take the visible or intellectual world—the world of progress—or that of coexistent forms, institutions, and systems, we find this everlasting law of the trinity prevail. It is actually the beginning of every science, the first movement of Nature, and manifests itself from first to last in every imaginable variety of forms. The four and the seven are its first-born. Take an example very different from the subjects above treated of. We shall take the three original colours—blue, red, and yellow. This is the trinity of light. These are simple, uncompounded colours. Then let us mix them, and we find that only four different mixtures can be made of them: first, blue and red; second, red and yellow; third, blue and yellow; and last of all, blue, red, and yellow in one;

in all, seven. There are only three different ways in which they can exist: first, in a simple state, as *three* distinct colours; second, all the three mixed, making in all *four*; and third, with only two colours mixed, which makes three more; in all seven. In imitation of, or accordance with, this simple law, there are seven colours in the rainbow or prism; the indigo, as an exception to all the rest, being composed of three: this is the deepest or blackest colour of the seven, the opposite extreme of white, which is also a mixture of three. Thus white and blue are the opposite extremes of light, and therefore the lights of heaven are set in blue. Green is the very central and most perfect of all the seven, therefore the earth is clothed in green.

We might prolong this interesting and instructive subject to an indefinite length, did time, and space, and the inclination of our readers permit; but we hope we have said quite enough to convince them that we were by no means building upon the shadowy foundation of vain imaginings, when we commenced our analysis of Nature with the disclosure of her threefold arrangements; and, after having pointed out these arrangements in every department of Nature, both in the past and present, both in history, politics, religion, and science, it cannot surely be thought inconclusive or rash in us to infer that the same eternal law of action will also regulate the future. It is by the past alone—by the invariable sameness of the results of experiments on figures and substances, that we attain to any knowledge which we possess. The same causes operating on the same subjects, always produce the same effects. Did we perceive any variation or fickleness in the operations of Nature, our confidence would be destroyed—there could be no science; the chemist could not be certain of the effects of his combinations; we ourselves could not have any faith in the food we eat, or the medicine we take to relieve our complaints; we could not even be certain that we should obtain a glass of soda water, by dissolving the acid and the alkali together. But Nature is unchangeable; her laws are for everlasting. Upon this datum we reason on all subjects, and for this reason alone are facts of any use in leading us to the knowledge of first principles—on this account alone do first principles exist.

It is foolish, therefore, to assail us with the usual retort of ignorance—What is the use of these things? Their use is to enable you to act the part of rational beings, by employing in a conclusive manner those powers of perception and judgment with which you are endowed by Nature, and thus accomplish that unanimity upon general questions, the absence of which has created all the political and religious divisions of past ages, and the attainment of which introduces the great Sabbath of the rest, that is destined for the universal species. Did these elementary truths not apply with resistless cogency of argument to the most important problems of politics and religion, the material and spiritual interests of mankind, we should regard them as mere amusements, such as Chinese puzzles, conundrums, and other childish toys. But their utility is not only infinitely superior to such puerile trifles, but actually indispensable as a standard by which to determine the right and the wrong, the

curse and the blessing, of any general subject of discussion.

Thus, for instance, we see the law of the trinity prevailing in politics as well as in light, &c. We have the three great sectarian divisions of monarchy, aristocracy, and democracy, each of which in all ages of the world has had its devoted partizans. To what conclusion does Nature directly lead us in the solution of the question respecting the comparative excellence of these three forms of government? The answer is obvious: they are all bad—all imperfect; for Nature divided is imperfection, or evil; in active and harmonious union, she is what we call good. Monarchy is evil, inasmuch as it subjects the many to the caprice of one; aristocracy is evil, inasmuch as it subjects the many to the caprice of few; democracy is evil, inasmuch as all are masters, and there are no directing, no controlling minds; but by uniting the whole you have a combination which is without a blemish. In democracy, you have the power of the people, or the species, where alone power can reside; in aristocracy, you have the directing influence of superior minds, to give order and utility to the general movements of society; in monarchy, the presidency of an individual, to give unity to the operations of the whole combined. Thus the doctrines of our system of analogy demonstrate the necessity of a general union of the leading principles of prevailing parties, in order to give being to a perfect system. Any man, therefore, who calls himself by the name of either party is in error; he only is right who unites the whole in one.

The same may be said of state and church, or the physical, intellectual, and moral government. It is not their division that will profit the people. The destruction of the Established Church would not put a sixpence in the pockets of the poor; the revenues of the church would soon be swallowed up by the all-devouring *kraken* of private capital and monopoly. It is the union of the church and state which is required: first, the union of all sects, and then the union of these sects with the political department so closely entwined that the church shall be the state; and the state the church, and both united shall watch over the temporal and spiritual, or intellectual, improvement of the population. We have no national church at present, no national state; we have merely the government of a sect; one sect has enslaved all the other sects, as a planter enslaves a number of naked and defenceless negroes. To be national, it must be approved and beloved by the whole, it must seek the good of all, and its blessings must be experienced and acknowledged by all.

Now all this can never be accomplished either in time or eternity, without a harmonizing doctrine, which shall gather together the scattered elements of truth from every sect and party, and make of all one perfect whole. A negative doctrine, which merely denies, and says religion has done no good, it is therefore all false, there is no truth or meaning in it,—is an irrational doctrine; for upon the same principle you may prove that wealth is of no use, machinery of no use, education of no use. And the positive doctrine, which says that any sect is right, and all others wrong, is also contrary to the first principle.

ples of natural science, and belied by experience. Neither the infidel nor believer can redeem the world; they each want the uniting doctrine, the spirit of interpretation, to simplify all things, and bring order out of confusion. The very argument of the infidel, that Christianity has proved a curse, (strange to tell!) is an argument for its truth, for its founder declared that he came *not to send peace, but a sword*. The very argument that the Bible contradicts itself, is another proof in its favour, for so does Nature invariably, always producing one extreme to oppose another; and therefore that book, which is emphatically called the book of Nature, ought to be a book of contradictions; and the Bible is such a book, for there is not one single doctrine in it which is not contradicted flatly in some other page. What is the use, then, of the infidel proving religion a curse, and the book a contradiction? He will find in the end the use to be very different from his expectations. Each party has a powerful weapon against the other; they are both indestructible; they are the oxygen and hydrogen of Nature; they may attempt each other's annihilation, but they will fight to eternity without accomplishing it any other way than by union, and the formation of a new church compounded of both. Thus the furious engagement of those two gases in the thunder-storm makes the vaults of heaven re-echo with its "deafening roar;" but after the fury of the onset is spent, the two conflicting spirits combine, and together form the liquid element of water, which moistens and nourishes the earth. Thus also it is said of him who will recal the wandering tribes of men, and lead them to his fold again, that "he shall come down like rain upon the mown grass, and showers that water the earth. In his days shall the righteous flourish, and abundance of peace so long as the moon endureth."

THE SHEPHERD.

CHEMISTRY.

CHEMISTRY may be called the universal art and science; it comprehends all others; all the operations of nature are chemical; nature is only one great or infinite laboratory. This science is at present advancing with astonishing rapidity, and throwing a flood of light upon all the phenomena of nature; sublime and intellectual, however, as it is, it had its origin in a source which is now considered contemptible. Alchemy was the parent of chemistry. The alchemists employed all the resources of genius and of art in the hopeless, but by no means fruitless, search after the philosopher's stone, or the universal solvent, (which would convert rude matter into gold,) and the universal medicine, which would prolong human life to an indefinite period. Paracelsus boasted he had discovered the latter; but he died before he was fifty. Van Helmont, his pupil, was equally vain-glorious; but he also died, and was buried with his fathers, and with him the ancient science or art of alchemy terminated its long reign of delusion and disappointment. However, it had not reigned in vain, for, although these enthusiasts failed in discovering the universal solvent, they discovered what was much better, the elements of a new art, which has revolutionized the whole of the arts and sciences, and

been the instrument of introducing innumerable domestic and personal comforts of which former ages had no conception. It is destined to perform still greater exploits as time progresses. Beccher, a Jew, was the father of chemistry; he brought it forth out of the dead and excommunicated body of alchemy, which had entirely fallen into disrepute; and since the year 1669, when he published his first work, it has been progressively advancing and undergoing successive reformations by the discoveries of extraordinary characters. Lavoisier effected a new reformation about the time of the French revolution, and the liberals of Paris rewarded his scientific zeal, and uniform meekness and innocence of character, with the honours of martyrdom, by the guillotine!! Before his day, the older chemists imagined that combustion took place by the combustible body emitting phlogiston, a name that they gave to the imaginary principle of inflammability. But experiment completely contradicted this theory, for it was found that a body, instead of losing, actually gained weight by combustion; thus, for instance, if all the smoke which is emitted from a burning candle be collected in a glass receiver, and afterwards weighed, it will be heavier than the candle was before it was lighted. This principle of inflammability, therefore, has no existence; but combustion is merely a violent chemical decomposition of the substance of the burning body, none of which is lost. The additional weight is occasioned by the combination of the gases which escape from the body with the oxygen or hydrogen of the atmosphere, the whole forming a new substance totally different from the original candle. The old theory was gradually dying before the time of Lavoisier, principally by the discovery of British chemists: he only accomplished the crisis. The discoveries of our own day are likely to simplify the science still more, and accomplish a still more important reformation than ever. Thus we see in the history of chemistry a beautiful illustration of that universal law of nature, that light comes out of darkness, or truth is brought into being by error. Man never stumbles upon truth at first; he always prefers an erroneous principle; but that erroneous principle contains within it the germ of truth, and a stimulus to action which never ceases to operate till truth is full blown. This stimulus is the life and soul of man; without it, his intelligence would be annihilated.

Delusive and absurd as were the dreams of alchemy, there were important truths concealed within them. The philosopher's stone and the universal medicine were types of the great and ultimate benefits which were to be derived from the science; nor is it all improbable that both may one day be realized; gold plate be as common as Wedgwood ware, and the period of human life prolonged by the final discoveries of chemical science respecting the constituent element of the human frame, and the antidotes which nature has provided against the evils which she herself has generated.

Although chemistry comprehends within its infinite grasp every other science which treats of action, inasmuch as all action is a chemical process, the name is popularly applied to the analysis or decomposition and composition of bodies. The chemist analyzes a body by discovering its component elements; he discovers in water the two

elementary substances, oxygen and hydrogen; he separates the two gases by the application of heat, and reunites them again by mixing them in their relative proportions. These two processes comprise the whole art of chemistry, and it will be easily seen that they also comprehend the whole of the operations of nature, which are nothing else than the eternal composition and decomposition of temporary forms and substances from everlasting elements.

The results of chemical discoveries demonstrate beyond the reach of doubt that gases, fluids, and solids, the three varieties of material existence, are all convertible into each other; that gases can be converted into fluids or solids, fluids into gases or solids, and solids into gases or fluids, and, consequently, that the trinity of matter is a perfect unity. Thus, for instance, take ammoniacal and muriatic acid gases, which are pure and invisible, transparent as air itself, and mix them together; you instantly perceive a white cloud of smoke to fill the bottles in which they are confined, and this smoke collects into a white solid substance called sal ammoniac. Little would the unexperienced mind imagine, when it sees two or three strong-bodied horses pulling along a waggon-load of this solid matter, that it is nothing else than two invisible gases in a state of union. Thus we come to the important conclusion that the original element of nature is gas, and fluids and solids are condensations of its particles.

The mode in which the different substances in nature combine, constitutes a particular branch of chemistry, called the atomic theory, or the theory which treats of the relative proportions in which the atoms of nature combine with one another. These proportions are constant and invariable; thus, for instance, if 104 parts of lead combine with 8 of oxygen for one proportion, the other proportions of oxygen must be 16, 24, 32, 40, 48, &c., or what are called multiples of 8, for 8 can be multiplied into one or other of these numbers. Knowing, therefore, the original atomic number which belongs to each substance, and each substance has only one appropriate number attached to it, you know at once the proportions in which any two substances in nature can unite. The atomic number of hydrogen is 1, because it is the lightest substance; oxygen is eight times heavier; its number, therefore, is 8, and 8 to 1 of oxygen and hydrogen in weight compose water, whose number is 9, because it is composed of 8 and 1. [The one grain of hydrogen occupies twice the space of eight of oxygen, so that it is really sixteen times lighter. This makes the numbering of the atomic theory very puzzling to a learner, although nothing is more simple than the theory itself. In the formation of water there is one measure of oxygen to two measures of hydrogen, or one to eight in weight, and they have made this one to eight the relative weight of the two gases; but it is only their relative weight in water.] It is impossible to unite them 5 to 1, or 8 to $1\frac{1}{2}$; and so accurately do they abide by the definite proportions, that whatever superfluous quantity of each is employed in the mixture is cast off, and mixes with the surrounding air, and there floats alone until it can find some other disembodied spirit like itself with which to enter into connubial union. Hydrogen, being so exceedingly light, must fly up with the greatest rapidity (witness the ascent of a balloon which

is charged with hydrogen), so that our earth and atmosphere must literally float in it. Thus we account for the northern lights, and other meteoric appearances, which have been calculated at the height of several millions of miles. Were space a literal vacuum, which is an absurdity to suppose, it would be impossible to account for such phenomena; but knowing that gaseous substances can be rarefied to an indefinite extent, and that these substances contain within them the electric properties of lightning, and the magnetic properties of iron, we can not only account for their appearance at such a distance, but also for their appearance in the north immediately above the magnetic pole of the earth.

Chemistry not only ascends to the sublimest regions of nature, but also condescends to the humblest employments of life. The food which we eat, the clothes which we wear, all our forensic and domestic comforts, are derived from the valuable transmutations which it effects. Thus the simple art of bleaching depends for its existence upon the chemical action of chlorine upon vegetable colours. Many of these colours are entirely destroyed by it; some are rendered faint, and some more brilliant. Any acid will change vegetable blue to red, and an alkali will change it to green; an acid will restore the colour destroyed by an alkali, and an alkali will restore the colour destroyed by an acid; and upon an intimate knowledge of these simple facts depend the invaluable arts of bleaching and dyeing.

This conversion of one colour into another evidently demonstrates that colour is only an effect produced by the mutual action of the elementary gases. This idea is also sufficiently confirmed by numerous experiments. The colours, as exhibited in the prism, have oxygen in the red end and hydrogen in the blue. Now oxygen and hydrogen produce flame or light, and so also we find the greatest light in the yellow between them; the oxygen and the hydrogen are thus extreme opposites to each other; the one decomposes what the other composes; the heat is in the red, the cold in the blue, and yellow is a medium. Yellow therefore is evidently produced by the union of blue and red, in a manner somewhat resembling combustion. The seven colours are arranged as follows: RED, orange \div YELLOW, green \div BLUE, indigo, violet; the red is the oxygen end, from blue to violet is the hydrogen end; the one the acid, and the other the alkali. Nitrogen is found between them, and it has no effect whatsoever upon vegetable colours; it is a combination of both extremes. The greatest heat is in the red, the greatest light in the yellow, the greatest cold and darkness in the blue division. This sufficiently accounts for the action of acids and alkalis upon colours. Chlorine, the principal substance used in bleaching, is an acid—oxymuriate.

As oxygen corresponds to the red or warm colours, and hydrogen to the blue or cold, so also we find, when water is decomposed by means of electricity or galvanism, that the oxygen goes to the positive end of the tube, and the hydrogen comes out at the negative; showing that the two poles of the earth, or the two sexes of the electric galvanic and magnetic fluids, are merely these two everlasting, omnipresent principals, oxygen and hydrogen; the oxygen being the male, and the hydrogen

the female. The two sexes of animals are also personifications of the same. Thus, the Scriptures say, "God made man in his own image, male and female." These two gases are the male and female nature, the father and mother of all organic beings, the *yea* and the *nay*, the alpha and the omega, the beginning and the ending. We speak merely of the visible and tangible Nature, or God (as it is written, every eye shall see him); as for the invisible spiritual power of unity which animates them, we cannot discover him. "No man hath seen God at any time, nor can see him."—"God is love," all the productions of nature are nothing else than the fruits of the loves of the elements.

The general outline of chemistry is extremely simple, but its varieties are infinite; there is no end to its transformations and changes. Every individual best knows those which belong to his own profession or experience. All its infinite varieties, however, are merely modifications of one simple law of action, and it is more than probable that the simple elementary substances are not more than two in number; these two at the same time resolving themselves into perfect unity and trinity by combination. Some of the most eminent chemists of the present age are of opinion that hydrogen is the elementary principle; that other substances are merely multiples of hydrogen, or hydrogen in different combinations. If this be so, it must contain two natures; the active and passive, or acid and alkali. By giving out its active principle it creates oxygen, which reacts upon the passive and produces all the movements of nature. That hydrogen has an acid within it is evident; there are a few hydracids, showing that it is not entirely destitute of the active principle. Oxygen forms also the principle of some alkalis. Like the male and female, they partake of the qualities of each other, whilst they preserve their distinctive character. It is impossible to say which is the original; they are both original, for the active and passive must be co-eternal and co-equal. The same reasoning holds good with man and woman, matter and mind; whenever a beginning is spoken of, however, the male, or active, is usually identified with it. This would give oxygen as the prime mover; but nature is both cause and effect; there is no beginning; therefore we must here pause, for to proceed would be only to reason in a circle.

We can only say that this splendid male and female organization, to whose existence there are no limits either of space or time, must be supposed to be equally infinite in every other attribute. There is nothing in existence which is not originally in it the source of all; whether it be wisdom, power, weakness, ignorance, heat, cold, light, darkness, love, hatred, &c., all exist in it in infinite immeasurable perfection. The wisdom, the power, the heat, light, love, &c., all correspond with the oxygen, or active principle; the weakness, ignorance, cold, darkness, hatred, &c., all correspond with the hydrogen or passive principle; yet each partakes in part of the other's nature. Thus the material world becomes a perfect type or resemblance of the spiritual or mental world, and all reasoning which applies to the one may be applied with equal certainty to the other. The one

is the invisible, the other the visible God, the Father and the Son; the Son is "the brightness of the Father's glory and the express image of his person." "The only, begotten of the father: he hath declared him;" and who is the only-begotten? The Christ universal, or material Nature? "In the dispensation of the fullness of time, he will gather together in one all things in Christ, *whether things in heaven or things on earth*, even in him;" that is, universal nature, of which the man Christ was merely an atom typifying the whole, which, in the progress of creation, begins with one atom and at last embraces all.

TIME

Is defined by philosophers to be "a succession of phenomena in the universe" better to be conceived than described, and of which, as Mr. Locke hath observed, we can only form an idea "by considering any part of infinite duration as set out by periodical measures;" other and later philosophers define the nature of time in terms somewhat differently expressed, though in meaning precisely the same.

The "measure" of such "part of infinite duration" depending therefore upon motion, the heavenly bodies have in every age been selected for that purpose, and the ancients distinguished their different seasons by the appearance of particular constellations; the rising of the Pleiades they made to denote the commencement of summer, and that of the Dog Star its declination: and by such general regulations alone, Aristotle marked the times of gestation and migration of animals; while subsequent knowledge enabled mankind to arrive at a more exact and better understood method of tracing the course of time, and to distinguish it by epochs, millenniums, cycles, centuries, years, months, weeks, days, hours, minutes, and moments, seconds, or instants.

Of the mechanical means that have by degrees been discovered of computing, and as it were marking time in its flight, the following is a general outline selected from a vast variety of sources.

The first mention of any instrument to show the passing period, is in holy writ, in the reign of Hezekiah king of Judah, and refers to the

SUN DIAL

of Ahaz, his father, who died about the year of the world 3278, or 736 years before the Christian era; though there is reason to conclude that the very obvious method of ascertaining the time of the day by a shadow, must long ere that period have been resorted to.

The dial of Ahaz was described upon the steps of his palace, and the shade of a pillar (erected probably for that express use) passing over it, was the full extent of accuracy at which the art had then arrived. There was no gnomon to this dial, nor is there any account of such addition until the invention of Maximenus Milesius, about 160 years afterwards. From the East, these dials found their way to Rome, though not until about 295 years before the Christian era, when Papirius Cursor erected one in the court of the temple of Quirinus; while before that period the nearest approach made by the Romans for ascertaining the hour, was, by observing

when the sun appeared between the rostrum where orators harangued and the spot called the station of the Greeks, or where ambassadors stopped when they were deputed to the senate, at which time the crier of the consuls proclaimed Noon.

M. Valerius Messala, after the taking of Catana, brought out of Sicily a dial which he caused to be fastened upon a pillar near the rostrum; and although it was inaccurate, inasmuch as the lines did not regularly accord with the time of day, not any better standard was used for near a century.

Lucius Paulus set up a dial about eleven years after that of Messala, though it was equally erroneous; and about that period Quintus Marcus Philippus is stated to have made another dial more correct.

But as these instruments were, even in their improved and corrected state, of use only in the day-time, and not even then when the sky was overcast, the Romans were frequently at a loss to know the hour of the day, and were totally incapable of deciding that of the night.

In the year of Rome 595, being 157 years before the birth of Christ, Scipio Nasica brought into use an instrument called

THE CLEPSYDRA, OR WATER CLOCK,

which, by acting in all weathers, and by night as well as day, was of the utmost utility and importance: whether he borrowed the idea from other nations cannot be now ascertained; but it is beyond all doubt that the clepsydra is very ancient, and, as well as the dial, an invention of the East; and Vitruvius attributes it to Cresibius, of Alexandria, who lived under Ptolemy Euergetes, about 245 years before Christ. The clepsydra of Scipio Nasica is thus described by Pancirollus: "They took," says he, "a vessel made of glass, in the bottom of which was a narrow hole done about with gold, lest the water should wear it away; on the other part of the vessel was drawn a right line having the twelve hours set upon it, after which they filled the vessel with water, which issued drop by drop out of the little hole: in the water was a cork with a pin stuck into it, and the point of that pin turned to the first hour when the glass was full, and to the other hours in proportion to the gradual decrease of the water. This by a Greek derivation was called a clepsydra, and with us an hour-glass." But the Romans afterwards made several alterations, and reversed its original method of showing the time, making the water escape into the lower receptacle of the horologe instead of the top glass, thus computing by increase instead of diminution; and they were soon brought into general use.

The Roman advocates, who in their pleadings had been considered to amplify beyond what their subject required, were, by the Pompeian law (founded upon a similar regulation among the Greeks) restricted to a certain period in their harangues, and for that purpose had always clepsydre placed in view to keep them within the prescribed limits. These clepsydre were of different sizes, so as to admit of longer or shorter periods of pleading, and they were distributed at the discretion of the judges according to the nature and importance of the causes; always allowing the accused half as much more

time to justify himself as was granted to his accuser in making the charge.

Julius Cæsar is said to have brought sun dials and clepsydræ to Britain, and they are stated to have been used in this country for several ages. It is however worthy of notice that although there might be one or more of each description so used, the want of some plan for measuring time was so generally felt, that Alfred the Great about the year 886 invented a new method of measuring time (which was followed for general purposes) by the burning of wax candles, three inches of which lasted an hour. These were committed to the custody of the clerk of the chapel, who placed them in horn lanterns, invented also by Alfred, to protect the flame from the wind, and who regularly communicated to the sovereign how the hours passed away.

The idea of the sand hour-glass was taken from the clepsydra: and our gallant tars still generally inform us how many glasses they engage with the enemy, instead of how many hours.

There are upon the continent at this time some clepsydræ or water clocks upon very scientific and accurate principles, with dial plates, and with bells that strike the hours. They are mentioned in Beckmann's History of Inventions and Discoveries, translated by Mr. W. Johnston, as having been revived and improved principally by Dom. Charles Vailly, a Benedictine monk, in 1690; though even so far back as the ninth century, they would seem to have arrived at great perfection in Asia. In the French annals there is the following description of one by Eginhardt, the secretary to Charlemagne, which he states to have been sent to his royal master by Abdalla, king of Persia, about the year 807. "A horologe of brass, wonderfully constructed for the course of the twelve hours, answered to the hour-glass, with as many little brazen balls which dropt down on a sort of bells underneath and sounded each hour; and there were also twelve figures of cavaliers, which at the approach of each hour came out of small openings in this horologe," &c. The Venetians likewise had clocks in 872, and sent a specimen of them that year to Constantinople.

After the clepsydra, the next and most essential improvement in mechanical contrivances for marking the lapse of time, was that of a

CLOCK,

impelled by springs or weights, and regulated by wheels and other contrivances, of which the Romans were entirely ignorant. This was called a nocturnal dial, to distinguish it from a sun dial, regardless of the apparent absurdity of that appellation.

Pacificus, archdeacon of Verona, who lived in the ninth century, in the time of Lotharius, the son of Louis le Debonnair, is esteemed as the inventor of clocks worked by wheels; though this reputation rests solely on the authority of an epitaph: and the merit of the invention is by many strongly contested as due to Boethius, who is said to have made the discovery about the year 510: whether, however, machinery by wheels and pulleys was invented by either of these persons, or only recovered from the celebrated sphere of Archimedes or that of Posidonius, it is certain that either Pacificus or Boethius was the first by whom such powers were applied to the regulation of time; and that a very considerable period had elapsed before the invention became practically use-

ful. Dante, who was born in 1265 and died 1321, mentions a clock in Italy that struck the hours, which is the earliest instance on record: and it appears that some such kind of horologe was about the same period fixed to the famous clock-house near Westminster Hall, the expense of which was defrayed out of a fine imposed on the chief justice of the King's Bench in 1288. In 1292 a similar clock was constructed for the Cathedral at Canterbury.

Mr. Warner, in the description of Glastonbury Cathedral, from his work entitled "A Walk through the Western Counties," has the following passage: "The northern transept contains a curious old specimen of the *ars horologica*, or ancient clock-making: it is a dial constructed by a monk of Glastonbury called Peter Lightfoot, about the year 1325, of complicated design and ingenious execution: on its face the changes of the moon and other astronomical particulars are contrived to be represented, and an horizontal frame work at the summit of the dial exhibits, by the aid of machinery, a party of knights armed for the tourney pursuing each other on horseback with a rotatory motion."

In Rymer's *Fœdera* mention is made of protection granted by Edward III., in 1368, to some Dutchmen who were "Orlogiers;" and Richard Wallingford of St. Alban's, in the reign of Richard II., from 1377 to 1399, made a clock for the abbey at that place.

Pendulum clocks, whereby the measure of time is reduced to the greatest precision, are but of recent date. The honour of the invention is disputed by Huygens and Galileo; "the former, who has written a volume on the subject, declares it was first put in practice in the year 1657, and the description thereof printed in 1658. Becker, *De nova Temporis dimetiendi Theoria*, anno 1680, contends for Galileo, and relates, though at second hand, the whole history of the invention, adding that one Treasurer, clockmaker to the then Grand Duke of Tuscany, made the first pendulum clock at Florence, by direction of Galileo Galilei; a pattern of which was brought into Holland. The academy del Cimento say expressly, that the application of the pendulum to the movement of a clock was first put in practice by his son Vincenzo Galilei, in 1649. Be the inventor who he will, it is certain the invention never flourished till it came into Huygens' hands, who insists on it, that if ever Galileo thought of such a thing, he never brought it to any degree of perfection. The first pendulum clock made in England was in the year 1662, by Mr. Fromant, a Dutchman."

Having traced the origin and progressive improvements in clocks, which in their original state implied those machines used in ascertaining the flight of time by striking the hours upon a bell, called in old German *clock*, and from thence in French *une cloche*, we proceed to the pocket movement of a similar use, denominated a

WATCH,

which is the latest name given to that minute piece of mechanism, to distinguish it from the clock, which, as before observed, denoted the passing time by sound and sight, while the watch expressed it by sight only.

But it is to be remarked that they originally were called dials, not watches, because they exhibited the fleeting hours of the day; and that, from the like cause, the part on which the hours are marked on both clocks and watches, is yet denominated the dial plate. This pocket dial is now generally called a watch, a name thought to have been given to it from the term watch having been antiently applied to the time when centinels paraded; from whence also we have styled our civil guardians of the night watch or watchmen; and on shipboard we still use the term watch for the divisions of nautical duty, morn-

ing watch, mid watch, &c., although watching is properly only applicable to night, and warding to day duty, and is so distinguished in all respectable old authorities.

Now, however, we have watches that regularly strike the hours and quarters, called striking-watches; and others which only strike on the pressure of a spring, termed repeaters; and we distinguish a watch from a clock, not only from the latter being generally impelled by a pendulum, though sometimes also by springs, but chiefly from a watch being so contrived as to be carried in the pocket.

The precise period when watches were first used is not known: the earliest on record were invented at Nuremberg, by Peter Hele, in the year 1490, and called "Nuremberg Eggs," on account of their oval form; and most of the antient watches in the different collections of our antiquaries, and that of the late Sir Ashton Lever, were of such figure. In 1500 George Purbach, a mathematician of Vienna, possessed a watch that described seconds, which he applied to the purpose of taking astronomical observations, so that they must then have arrived at great perfection. A watch thought to have belonged to Robert Bruce, king of Scotland, who reigned from 1305 to 1328, was said to have been dug up at Bruce castle not many years since; but this story is generally supposed to have no foundation in truth. The emperor Charles V. is stated to have had several watches, with which he was accustomed, after his abdication, to amuse himself, by trying to keep them all in an exact agreement of time; but it is asserted by modern authors, that they were only small table clocks. Our Henry the Eighth, who lived at the same period, is declared by Derham, who published his *Physico-Theology* in 1514, likewise to have had a watch which continued, during Derham's life, to keep time correctly. It is nevertheless now contended, that these machines were invented only so recently as the year 1658, and that they owe their origin either to Dr. Hooke, our own countryman, or M. Huygens; but to which of these two distinguished philosophers the merit of the invention is due, the learned have not yet been able positively to decide. By many it is conjectured that both these great mechanical geniuses invented a similar machine about the same period; and a watch after the model of those made by Hooke and Huygens, was presented to our Charles the Second with this inscription:—"Robert Hooke invent. 1654. T. Tompion fecit 1675."

From that time watches have gradually improved to so very considerable a degree, as to be regarded by some as having attained their *no plus ultra*; and they are now constructed with such extreme accuracy as not to vary many seconds in the course of a year, whence they are emphatically denominated timepieces, to mark that astonishing precision of action.

Repeaters, or such clocks and watches as strike the hour, and the quarters, by the pulling of a string, or pressure of a spring, are universally admitted to have been invented by Mr. Barlow, who first put the contrivance into practice to clocks in the year 1676, though he did not apply his invention to watches until the reign of James the Second, when he procured a patent; but Abraham Quare having made and shown to the king and council a watch upon the like principle, to which a preference was given, the same was explained in the Gazette, to the injury of Barlow's fame and interest.—*Clavis Calendaria*.

MAN.

"In consequence of possessing the intellectual nature, man differs so much from the rest of animated nature

that he can hardly be considered as part of the system. It is true that, in so far as he is material, his body must obey the laws of matter, or overcome them only by means of organisation mechanically fitted for that purpose, just as is the case with other animals; but when we come to study the structure of his body, and the functions which it is capable of performing, we find that they are regulated by principles to which there is nothing analogous in the rest of creation.

"When we examine the other animals in conjunction with the physical circumstances under which they exist, we find so perfect a coincidence between the animal and the circumstances, that we can only say the one is made for the other, and that the animal is perfect in its place. One is fitted for one climate and surface, and another for another; but they are all equally well-fitted for their several places: and when we attempt to take them out of these, their nature resists; and, if we push the case to extremities, their life yields. But man is not completely in his element any where in wild nature, and as little can we say that any where he is completely out of it.

"Place man in the very richest spot that can be found upon earth, and notwithstanding the richest luxuriance of nature—that luxuriance in which all the rest of the creatures wanton, as it were, in the fulness of enjoyment,—there is so far from being enough there for the full development of his powers, that these seem to remain inert and he to languish, in proportion to the richness of that plenty in the midst of which he is set."—*British Cyclopædia*.

[The distinction between man and the inferior animal creature is infinite. No doubt man is a material being like other animals, but so is Nature herself, she is material also; this is no proof of imperfection, but necessary for the acquisition of that experience which gives birth to scientific knowledge. There is this remarkable difference between man and the brute creatures; that man only is a scientific and progressive animal. Whatever symptoms of science and progress any other animal possesses, are rather to be considered as resemblances than realities; sometimes a dog may be taught to do many things which give evidence of foresight and concatenation of ideas; but it cannot communicate its discoveries to another, and very little is the amount of experience which it can acquire. A cow has been known to lift the latch of a gate, and go out of the inclosure, but it could never teach the trick to the herd, who stood like brainless boobies, lowing and murmuring until their accomplished portress made her appearance and gave them release. The greatest idiot ever suckled by woman has more intelligence, art, and mechanical skill, than the most perfect of the brute creation; but the limited intellectual capacity of the latter, whose ideas extend not beyond the present spot and moment, when compared with the mind of the philosopher, who analyzes the past and anticipates the future eternity, whose ideas extend to the infinity of creation, and whose genius investigates the elements of nature, and forms new combinations, new worlds and systems, like nature herself, is so exceedingly contemptible that the one may be called the one extreme, the other, the opposite. What has led some to the absurd idea that the difference is but trivial between man and the brute, is the contemplation of man in the infancy of intelligence and morals, overlooking his unlimited capabilities. It is one of the greatest proofs of the infinity of the distinction which subsists between man and those animals subjected to his control, that he himself can descend as far beneath them in folly and brutality as he rises above them. He has the hell and the heaven of in-

tellect and morals within him. He is a beautiful, a complete image of Nature herself. "God made man in his own image;" and he is so in a peculiar sense, for he can do both good and evil to excess. Man is the one extreme, the inferior animals are the opposite extreme. These extremes correspond to the extremes of unity and division; therefore there is one species in the one extreme, and infinite variety in the other. But it is not until the social unity of the human race be accomplished, that its godhead can be complete. Division is mortal, unity immortal. Hence an argument for the immortality of man. Brutes can never be socialized, that is, they have not the principle of unity within them.]

THERMOMETERS.—There are two liquids in use for the construction of thermometers, mercury and spirit of wine. Each has its peculiar advantages. Mercury can withstand a very high temperature, and spirit of wine a very low temperature. The latter cannot be frozen. Neither of them, however, can measure the gradations of furnace heat. This is generally done by a bar of platinum, the most valuable metal in existence, and the least fusible by heat. Its expansion by heat and contraction by cold afford the means of ascertaining the relative power of the most intense furnace. Such an instrument is called a pyrometer (or fire measurer). There are several different thermometrical scales used throughout Europe, which caused considerable confusion and unprofitable trouble in the scientific world. Our own scale is that of Fahrenheit, a Dutch merchant, in which the freezing point is 32, and the boiling of water 212. The centigrade is used in France, freezing point 0, boiling point 100. Reaumur's has the boiling point 80. De Lisle's is a descending scale, boiling point zero, or nothing. This is in use in Russia. This all produces the same effect as a difference of language, in causing a separation between the scientific pursuits of different nations, and preventing that free and social intercourse, without which illiberal and limited views of all subjects must to a certain extent possess the minds of nations and individuals.

CORRESPONDENTS.

We have read R. L.'s Essay on Friendship with pleasure and approve of the sentiments contained; but whilst we moralize occasionally, we always connect our maxims with some useful matter-of-fact information, which is cognizable to one or other of the five senses. We have set out upon this principle, and we mean to abide by it: good morals are not to be accomplished either without or before instruction. The morality and the scientific intelligence of the people must progress together. Hence our system is neither to give scientific analysis without moral conclusions, nor moral instruction without scientific analysis; but to build the former upon the latter—and we wish our Correspondents to remember this.

The Printer says the Essay on Aphorisms must stand over till next week.

One of the Unwashed is just received; we have not yet perused it.

In our last article on Geology, 4000 years ago was substituted for 4000 B. C. The mistake, however, might almost be maintained as a literal fact.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Brady, Sheffield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A.M.

No. 10.]

SATURDAY, NOVEMBER 1, 1834.

[Price 1d.]

SYSTEM OF NATURE.

WE shall now investigate a very nice and important question, namely, whether the good or the evil of Nature predominates.

This question divides itself into two departments; the one relates to evil and good co-existent; the other to evil and good in succession. The former is not of much importance to our present purpose, and therefore we shall pass it over in a very summary manner, leaving it to the judgment or the humour of each of our readers to determine the case for himself, provided only that he take a general view of the subject, and not that partial, individual view which still perverts the reasoning powers of the whole species to such a degree as proves disgusting to the refined and generalizing mind. But the determination of the question in favour of the prevalence of evil at present is in perfect accordance with the doctrine which we teach.

It is to the progress of Nature that we look with the greatest interest. Existing institutions, systems, and dispensations, are merely upon a par with existent individuals of animals and plants; they for are ever changing, for ever dying, and reproducing their likenesses. The question, therefore, of most momentous interest is, what is to be the result of these progressive changes; which extreme is to preponderate?—is the progress to move onward everlastingly toward good; or is it at any time to retrograde towards evil?—have we better reason to encourage *hope* than *fear* of futurity?

This point, we think, is very easily settled. There is a youth, a manhood, and an old age; a birth, and a dissolution; not that there are any limits to the progress of mind, but there is a limit to the sphere of its operations in this part of creation. There are limits to population, limits to production, limits to fuel, limits to cultivation, limits to geographical, geological, astronomical discoveries, limits to improvement in every one of the sciences, beyond which it is impossible to progress in the present state of being. But before such a consummation as this arrives, the world will be all cultivated, the inhabitants all civilized, unity of sentiment upon all general subjects will prevail; and comparative perfection, such perfection as a planet will admit of, will be attained in every one of the arts and sciences; for all must progress and be perfected together, inasmuch as they are all one science, the science of Nature. This is the millennium that we anticipate; it is but a temporary state of being, not from any want of unity and inclination in the human species to continue it, but from a deficiency of material for the in-

satiable infinitude of the human mind to work upon; hence, all religions, in perfect accordance with this philosophical doctrine, have taught that this long-promised, long-desired age of unanimity and happiness will prove but a limited period. The Christian religion says one thousand years, during which the human race will enjoy the fruits of the labour of six thousand previous years, as a working man on the Sabbath-day enjoys the fruit of his six days' labour, and relaxes himself from his toil; it is merely a Sabbath; and then the whole process of labour commences anew, or the whole is dissolved for a recommencement. This is not only a reasonable doctrine, but, in our opinion, perfectly conclusive, as it is in accordance with all the established laws of Nature's action in this planet; still, however, in ordinary language, we do not hesitate to talk of the progress of the species going on for ever.

This dissolution is no defect in Nature; it is merely the resolution of all things into unity. The political and religious systems of all ages are first united, terminated, and consummated. They are like the individuals who found and compose them. Then greater and greater systems unite, in infinite progression; and although it be going rather beyond the bounds of certainty to say that all the planetary systems shall one day have a central union, yet it is quite in consistency with the law of Nature's progress to suppose it. Upon this idea one of the most sublime, the most practical, the most philosophical visions of refined and elevated fancy may be erected, which is innocent at least, and ennobling to the human mind, if not literally correct, and infinitely more exhilarating than the doctrines of everlasting night, which are so grateful to the modern disciples of the old French philosophy. The universal gathering of all the sons and daughters of the solar system in their common centre of light and motion, is not more unlikely, nor more impossible to Nature, than the union of the working-classes, the union of sects, or termination of wars, and the reformation of political and ecclesiastical establishments; it is the same idea of reformation and union extended, and a splendid subject for an epic poem, to which we hope some poetical genius will speedily treat us.

Whatever be the fate of partial and local systems, the result must invariably be extended or greater good. This is the simple inference which must be drawn from the acknowledged fact of the unity of Nature. Harmony never can bring forth everlasting discord; union, everlasting disunion; and order, everlasting confusion. Now we know from overflowing evidence, that universal harmony prevails in the operations of Nature's laws; they are

unchangeable—the same yesterday, to-day, and for ever. This is the harmony of coexistent laws and modes of action, and the harmony of progress must correspond with it.

But it may be asked, how does it happen that there is so much discord in Nature, if her laws are harmonious, and her progress the same? We answer, it is only the ignorance of the individual which creates the discord, which must gradually disappear as knowledge progresses; and no sooner shall unanimity on the first principles of Nature prevail, than public peace and prosperity shall come along with it. The operations of systematic thought in each individual mind are working to a general combination, and the rapidly increasing means of correspondence and social intercourse are daily facilitating its accomplishment; so that the discord of which we speak is not the discord of general, but individual Nature; and without it there could be no progress, no variety. Nature is unchangeable as a whole, but for ever changing in her parts; and thus she (or God) is both *changeable* and *unchangeable* at one and the same time. Hence the folly of those arguments which oppose religions upon the principle of their changeable character. They can only be used by those who are utterly ignorant of the science of “Progress.” The arguments are quite conclusive against the final truth or perfection of any system of religion which is not universal; but not effectual against its divinity, for *nothing is more changeable than divinity*.

It is in this changeable department of Nature alone that progress can exist; and wherever that progress, as is the case with the progress of mankind, is intellectual; where-soever the experience of the past is accumulated and acted upon by successive generations, there can be no retrograde movement. Any relaxation of activity which can take place will settle down into the quietude of age.

The consummation of all the great dispensations of Nature is, without doubt, a work of great beauty and great goodness. She was, no doubt, in earnest when she arranged the various systems of which the universe is composed; and she is equally in earnest in conducting their movements with such unchangeable nicety. There is no appearance of chaos within her rich domains; no jostling of stars, planets, or systems in the heavens above; and equal distinctness and order of arrangement in the earth beneath. This convinces us that her great plans are good; and is a sufficient security that the subordinate plans, which are conducted by man, will converge in the same focus of general utility.

The application of this axiom, for it may be considered as one, is of great importance. We have often been opposed by the religious world, upon the plea of putting a negative upon all the hopes, as well as the superstitious and horrific fears, which are inspired by the priesthood, in maintaining that the source of evil and good, error and truth, is one; that, such being the case, our doctrine must be subversive of human happiness, inasmuch as it destroys some of the finest and the noblest feelings which cheer the progress and illumine the gloom of the short allotted span of existence. We answer, that no such accusation can alight upon us, for our doctrine of progress from evil to good, our doctrine of uni-

versal harmony, evidently implies that the truth and the good must ultimately prevail; that the evil is of temporary duration, everlastingly changing and progressing towards better; but that good is the goal to which the evil advances. We destroy the evil only, and not the good; the falsehood only, and not the truth; the fear only, and not the hope. We never yet lifted our voice nor moved our pen against the highest and fondest hopes of humanity, and never will. We should accomplish no good by destroying them: but we know very well that their destruction is impossible. We choose rather, therefore, to sail along with them, and enjoy the consolation which they inspire.

We shall give a common-place instance, which was urged against us by a preacher of old Christianity, a few weeks ago. “If,” says he, “truth and error come both from one source, how am I in my religion to distinguish the truth from the error? I am told that ‘the wicked shall go into everlasting punishment, but the righteous into life eternal;’ don’t you destroy my hopes entirely, by making it problematical whether this be true in part or in whole?” We replied, “No, we destroy no hope; we never lift our hand against hope; hope is not an evil. Hope does not extort tithes to pay lazy and luxurious priests, for hope is its own priest. It is fear alone which supports the priesthood, and the whole mystery of clerical iniquity. ‘There is no fear in love,’ says an apostle; ‘perfect love casteth out fear; because fear hath torment: he that feareth is not made perfect in love.’ Love gains the victory, and so does truth; hence, wherever we find good and evil intermixed in religions, we lay it down as a universal rule to receive the good and reject the evil; at the same time that we regard them both as divine. Notwithstanding, we do not do so without an ample sufficiency of other reasons, nor without giving a definite meaning to the errors we reject. Nothing can be more true than the passage you have quoted, ‘the wicked shall go into everlasting punishment.’ Who are the wicked? the man, or his principles? When he changes his principles from bad to good, he becomes good; and when he changes from good to bad, he becomes bad; which shows the good or the evil to be in the principle alone. Hence the destruction of wickedness alone can be inferred from a saying like this, contained in a book like that.” “Then,” replied the other, “it follows that the good principle only, not the individual, will be preserved; and this completes the destruction of my hopes!” “The very contrary follows from the law of progress, and the ultimate subjection of evil to good; for if it be an evil to be destroyed, it is a good to be preserved; it follows, then, from the doctrine of GOOD AND EVIL, that the promise may be literally received, the curse literally rejected, whilst both are spiritually true in respect to principles. All men are wicked; the destruction of their wickedness is the greatest blessing which can be conferred upon them. Even the *fearful* are to be cast alive into the lake of fire (Rev. xxi. 8), and this includes all those who through *fear* support a luxurious priesthood, and a system of religious mockery. You accuse us of destroying your hopes; yourselves are the greatest enemies of hope, for if your doctrine be true, the *fear* of the Lord is

the broad way to perdition. But we have one eternal axiom, which all Nature and all Scripture conspire to confirm; and by this one axiom we destroy all fear, and encourage all hope; for we prove to demonstration that Nature progresses to good, and that all evil, physical, intellectual, and moral, must gradually disappear."

THE SHEPHERD.

THE SOLAR SYSTEM, &c.

HAVING pointed out some of the general laws by which Nature has arranged her component parts in the combination of her elementary principles, we shall now see how these laws apply to the formation of the gross material arrangement of the system to which we belong. We shall find that it is fashioned upon the original model, which seems to be the "*beau idéal*" of universal nature. There are *seven* primary planets which move round the sun; there are eighteen satellites, and four asteroids, or little planets, which divide the system into two great divisions: the model, omitting the minor bodies, may be represented as follows:—

● ● . . .

The SUN, then Mercury, Venus, the Earth, and Mars, for the first division; afterwards, at a greater proportionate distance than divides the members of the first division, Jupiter, Saturn, and Uranus: compare this with the division of light, and you find the resemblance perfect. Light for the Sun; then red, orange, yellow, green÷blue, indigo, violet. Red, orange, yellow, and green, as we observed in our last, are the division of light and heat—(oxygen, &c.); blue, indigo, and violet are the division of cold and darkness—(hydrogen). Mercury, the Earth, and Jupiter represent the three original colours, red, yellow, blue. The greatest heat is in the red, and Mercury is nearest the sun; the greatest light is in yellow, and the Earth is the best illuminated of all the planets, inasmuch as it is nearly as well illuminated during the day as Mercury and Venus; and being provided with a satellite, with which Mercury, Venus, and Mars are not, it enjoys the superior advantage of "moonlight day," a privilege which belongs to no other planet in the division of light; and the three great planets in the division of darkness have but a very scanty supply of light both by night and by day. This is the true scientific reason why the Earth is provided with a satellite; there is no accident in it. Philosophers have entered into many ridiculous speculations concerning these satellites; some have supposed they are fragments of planets burst by some furious convulsion of nature; and many other chaotic notions of their chaotic origin, have amused the leisure hours of the disciples of chaos. These notions may be correct, but it will ultimately be found that there is a better reason for every thing, and that there is not a planet in the system, nor a political or religious establishment within the planet itself, which has not as definite and precise a meaning, end, and purpose, as any bone, muscle, or nerve of the human body.

Between Mars and Jupiter there are four little asteroids, which cross each other's orbits, so that their orbits mingle with each other. This expresses, in the

only way in which a solid model can express it, the four-fold compounds which divide the seven colours into three and four, or the musical notes into three simple and four compound; and they also completely tally with that universal notion which has prevailed amongst all people of the four ages or empires which have divided the human family, and created bloodshed and strife amongst all the interests of mankind. These four ages are incorporated with all the poetic writings of the ancients. Servius informs us that the prediction originated with the Cumean Sibyl; and Probus also declares that she predicted the "Palingenesia," or universal regeneration, after the revolution of the four ages. The same idea is also to be found in the Hebrew seers, who usually described the church, or human family, under a seven-fold character. The seven churches, the seven spirits, seven eyes of the Lord, seven horns of the lamb, seven stars, &c., are only different modes of describing the seven-fold features of the great catholic or universal Jerusalem. "What be these?" said the prophet Zechariah when he beheld *four* horns which scattered the nation; and the angel answered, "These are the horns which have scattered Israel, Judah, and Jerusalem."

The ancients generally distinguished these ages by the names of the four metals—gold, silver, brass, and iron. These are all very tastefully arranged in Nebuchadnezzar's celebrated image; the head of gold, the breasts and arms of silver, the belly and thighs of brass, and the legs of iron:—the Chaldean, the Medo-Persian, Grecian, and Roman empires. After that, the little stone appears, which breaks the image in pieces, and founds the universal empire. "And in the days of these kings shall the God of heaven set up a kingdom which shall never be destroyed, and the kingdom shall not be left to other people; but it shall break in pieces and consume all those kingdoms, and it shall stand for ever." The same may be said of the four beasts.

This idea is very beautifully illustrated in the five senses, for which we refer our readers to another article. Four of the senses are partial, or local; the fifth, which is the sense of feeling, is universal, and comprehends all the rest: hence, Nature, in following up the order of the senses, arrives at universality at the *fifth* stage, which is a perfect note in the musical monochord, and corresponds with yellow, or the greatest light in the seven colours, counting from darkness upwards; and it corresponds with Jupiter, or the greatest bulk, counting from Mercury outwards.

The descent from gold to iron, in the enumeration of these four ages is a curious illustration of the deceitfulness of truth to the ignorant mind; it has even, to the modern and more enlightened mind, the appearance of a gradual deterioration, inasmuch as it is a descent from the more precious to the least precious. But this is an illusion of the ear; it is not a descent, but an ascent; the golden age is the age of barbarism, the least liberal and extended, when men first begin to form themselves into society, and hold commercial intercourse with each other. Then gold is accounted the most precious of all metals; it is the *summum bonum* of human happiness. As knowledge progresses, the least splendid metals then begin to be

more and more appreciated, till finally, at the consummation of the progress of civilization, iron assumes the supremacy over all, and rules the destinies of the world. There is another sense in which the succession may be esteemed a progress to perfection: gold is a rare metal, silver less so, brass still less, and iron the most common. The next age embraces all.

We have made a strange digression from the solar system to the age of iron, but it is all in perfect accordance with our views of the harmony of Nature; therefore our readers must just be contented to follow us, whilst we run up and down the surface of existence, snuffing, and smelling, and poking our nose into every thing. They will be sure to learn something from us, if they are not already perfect, as some folks either are, or think they are. New minds view Nature with new eyes; and when new views are pointed out, new modes of reasoning and improved systems of philosophy are the consequence. True philosophy is only refined superstition. Every thing, even superstition, is good when it is well polished. What is a looking-glass, but earth or sand?—what is a diamond, but a piece of charcoal?—what is a razor, but a piece of pig-iron polished?—what is a poor Irishman, but live potatoes? A true philosopher is a universal chemist; he decomposes every subject, and reduces it to its original elements; and as a chemist finds the most useful ingredients in the most useless compounds, so the real philosopher will convince the world at last that that which is least honourable in the sight of men contains the pearl of great price.

This is an age of knowledge; and matter of fact, as they call it, is in great repute. Thousands of individuals are employed in gathering mere scraps of information to satisfy the appetite of the people for real facts; and verily they are provided with facts; but they are like the Sibyl's leaves, flying in the wind, and no one to arrange them in order. Hence the confusion which prevails in the world of opinion. We have lectures upon all the sciences, by the most learned and ingenious men of the age, men of invention and discovery, who are always adding to the ample stock of useful information, and are practically conversant to an extreme nicety with the departments of knowledge which they possess; but there is this singular peculiarity about them all, that they never compare the first principles of their own science with the first principles of other sciences. There is no science of unity or analogy, no comparison instituted between the different departments of nature: on this account the idea still prevails that the sciences are distinct from each other: and when such separation of mind exists in the leading department of human society, what else can we expect but division in the system throughout, extending even to the minutest veins and arteries of social life? It is vain to attempt unity of any kind until this species of unity is accomplished, for science is the very heart of the intellectual and moral world. Science contains the materials of thought, and the original elements of opinion, which must for ever rule the destinies of society. How necessary, then, must it be that those original elements of thought be collected in a focus, and presented before the mind in such a way as to satisfy it that all nature

combines to consecrate them as the bases of eternal truth! To do so, we must begin with the simplest lessons, the mere alphabet and table of figures, for so little is the subject known, so far, in fact, is it from ever having been imagined, that to do more would only perplex and confound.

On another occasion we shall treat of the remaining eighteen members of the solar system. But before we conclude we may remind our reader of its three-fold division, which so beautifully corresponds with our previous chapters on the System of Nature. The first is the outer division of three, the second is the division of four, and the third is the Sun himself—the physical, intellectual, and moral tri-unity. These, in the progress of religion, correspond to the law, the first gospel, and the everlasting gospel—the midnight, twilight, and sunshine of the mind.

EGYPTIAN SCULPTURE.

THE remote age, the peculiarity of expression, and the astonishing skill, which mark the execution of the sculptural remains of ancient Egypt, have made them at all times objects of great interest and speculation to the real lovers of antiquity and art. The principal characteristics of Egyptian sculpture differ most decidedly from every other with which we are acquainted. In Greece and Rome, where art was carried to the highest pitch of excellence, sculpture was regarded as an imitative science. To represent the human form with natural grace and dignity was the only aim of the best masters, and although some critics would have us believe that the Greek ideal was derived from what they call divine ideas not existing in nature, an examination of their works will soon convince an attentive observer that the truth and beauty which they display are derived purely from unsophisticated nature. Not so with Egyptian art; here sculpture was under the immediate direction of the priesthood, who, monopolizing the knowledge and power to themselves, took especial care to make this art subservient to their purposes. Under these circumstances the business of the Egyptian sculpture was to give dreamy representations of the theological ideas of this strange people, and to prevent even the possibility of innovation. Slaves educated under the superintendence of the priests were alone intrusted with the carving of the principal figures, and the execution of the most magnificent monuments. The human form seems to have been used by Egyptian artists to show how perfectly unnatural they could make it appear, and that they have succeeded to a wonderful degree must be admitted by most persons who have inspected the EGYPTIAN SCULPTURE GALLERY in the *British Museum*, which is allowed by the best judges to contain the finest collection in Europe. Look at the beautiful head of the younger Memnon, and the other colossal heads with a sort of cap on, that are there deposited, and see how void they are of sexual or natural expression. The faces of both are formed of natural features delicately executed, yet, strange to say, there is no vitality, no living and breathing appearance about them, and, above all, there seems a perfect absence of that

appearance of motion which so distinguishes the productions of the Greek chisel. You may view these heads as long as you like, but you never can sympathize with them; you never say they look as if they would speak. The sentiment excited by them is of a grave, dignified, and austere character, and those who are capable of receiving the strongest impressions from sculptural productions, in all probability would admit that the impressions left by Egyptian specimens are quite different, both in kind and degree, to those resulting from any other inanimate object whatever. The hand of superhuman talent seems as it were to have wrought in them an influence at once awful, gloomy, and unearthly. In a word, we may say of these, and every other legitimate specimen of Egyptian sculpture, they are like nothing in existence but themselves. The best writers on this subject agree that the true era of Egyptian sculpture ascends from the invasion of Cambyzes to remote antiquity.

It was during this period only that the arts were conducted with true national taste and talent; and the mighty remains still in existence make us wonder how such an immense accumulation of physical power could have been so efficiently directed to one object; for there is no government on earth that could so command the labour of the millions in our times to carry out a mere fragment of the architectural structures that adorned the shore of the sacred Nile. What means the Egyptian sculptors could have used to carve such impenetrable substances as porphyry, granite, and basalt, is perfectly astonishing to us, since the best tools of modern manufacture will hardly make an impression on similar substances; yet the Egyptian carvings are finished with a sharpness and sweetness which have not yet been "indented by time's everlasting grasp." There is one very peculiar feature in the statuary of Egypt, which must have excited the attention of almost every one. It is a sort of dove-tail pilaster, which runs up the back of all their figures, be their position or character what they may. This feature has puzzled the learned not a little; some have supposed it to have been left merely to attach the figures to the temples, baths, or public works; while others have thought, doubtless with more propriety, that it was left in compliance with some religious notion of this curious people. As Egypt fell under the dominion of foreign powers, and was governed by new laws and opinions, important changes were made in the principles and character of her sculpture. The Persians prohibited rather than encouraged sculpture; for, as fire was the symbol of their deity, religion, which in every other case patronised this art, among those people perfectly proscribed it. "The Persians," says Herodotus, "have neither temple nor statues." The Macedonian empire next succeeded the Persians; yet the native and ancient arts of the country declined under their dominion; they destroyed palaces, cities, and temples for materials, out of which was reared the city of Alexandria; so that although the deviations and additions were great, the arts of the country still retained much of their original character. The Romans finally introduced a new character and style in the arts of Egypt. The Emperor Hadrian had imbibed a great fondness for Egyptian sculpture during his

residence there for two years; but the works which were executed under his patronage had valuable accessions of Grecian beauty; they were modelled after the most ancient specimens, and were wrought out of materials extracted from the same quarries; but the artists were Greeks or Italians, and the character of design any thing but Egyptian. Numbers of these productions were carried to Italy, which has led to great mistakes, persons taking them to be the productions of the ancient Egyptian sculptors. Mr. Memes says that he doubts if a single statue of genuine and ancient Egyptian workmanship is to be found among the numbers that have been discovered in Italy, and with which Hadrian filled that portion of the empire.

If these brief remarks should be the means of making but a few of your London readers regard the rare collection of Egyptian sculpture in the British Museum with more interest and attention than they have hitherto, my principal object will be attained; for I am particularly anxious to see the producing part of the population take an interest in these public exhibitions, and participate in the intellectual pleasures derivable from an acquaintance with works of art. The subject of my next paper will be Grecian sculpture.

ONE OF THE UNWASHED.

[We certainly decidedly agree with our correspondent in his respect for the fine arts. They are the great source of all intellectual and moral refinement. Man first begins by polishing rude matter into *beaux ideal* of beauty; and then he proceeds to polish his language, thoughts, and behaviour. It is the natural ascent of Nature in her progress from the infinitely low to the infinitely high; no people can ever be refined, good, or wise, who are not devoted admirers of the fine arts. The frequent contemplation of fine exhibitions, and first-rate specimens of handicraft, become therefore an essential element of a good education. But our government is much less liberal in providing such intellectual food for the people than many other governments in Europe, who in other respects are more tyrannical; still, the people of London have in general more opportunities than they take advantage of.]

APHORISMS, MAXIMS, AND PROVERBS ANALYZED.

NO. I.

"Fine sense, and exalted sense, are not half so useful as common sense."—SWIFT.

In the first place, I have to find a name for this quotation from the facetious Dean, and I reason thus:—An aphorism is a trite or pithy sentence, necessarily, I conclude, involving truth. Now, as I shall have to show this is saturated with error, I cannot confer on it this superior nomen. A maxim is an axiom, and we all know this term to be directly inapplicable to an error. A proverb is a common saying, and truth forbid this nonsense should ever become common! I must therefore humble Swift's unhappy lucubration to the small and very indefinite word "sentence." To begin; the inference from this sentence is evident; but before making allusion to it, we have to scrutinise the correctness of the terms employed; for let maxims deduce truth as they may, they must be prac-

tically valueless and inutile, if based upon error. The word *sense* truly signifies the power possessed by the external organs of receiving impressions from surrounding objects, and includes their capacity of transmitting these impressions to the brain, where alone they are recognized and perceived. Thus the outward construction of the ear is such, that the vibrations of sound are collected by the *membrana tympani*, or drum, and passing through the ear are conveyed by the nerves to the *encephalon* with a rapidity so inconceivably great, as to reach the brain seemingly simultaneously with the action of the sound upon the ear.

In like manner the eye is enabled, by its connection along the nerves, with the *encephalon*, to discern the works of nature and the products of art. The power of smell is exercised by a process precisely similar; and feeling, distributed over the whole body, is experienced by the same agency of the nervous system.

Sense, then, we discover to be a most essential function of the body; and although mind and body are so intimately connected that independence the one of the other involves a contradiction in science—the perceptions of the brain, for example, serving as the basis of conception, thought, and knowledge; yet the term *sense* can be applied to mental operations (as Swift designed, beyond the suggestion of doubt) with no more appropriateness than can the piston-rods of a steam-engine be called the fly-wheel or governor.

But this is a common, although undeniably most barbarous, signification given to the word *sense*. People usually, from ignorance, or an inaptitude for using their reasoning faculty, employ words as they would snow-balls, flinging them about to all points, and caring only that they hit; but in their preparation is this material difference, that words are used regardless of their suitability, while the snow-balls are carefully made up to an exact fitness. Into some such error as this the Dean appears to have fallen, which is the more curious, since in his “reverend” capacity we should have expected him at least a tolerable lexicographer. The meaning frequently attached by the unreflective to the term *sense*, is mental cultivation of some sort; often shrewdness in trade, and cleverness in the acquisition of property. In other cases, sense is made to signify varied knowledge, with the ability to its ready application; while in either instance the use of the word is evidently most cruelly perverted. This is the signification Swift prescribed for it; but before alluding to his maxim, granting him the perversion of the term, I have something to say concerning the expression “common” sense. I shall here accede to our author *his* meaning of the word *sense*. The outward organs being the recipients of external impressions, the nerves being the agents of the transmission of these impressions, and the brain being the magazine of their accumulation, and the depository of all intellectual power; and these outward organs and nerves, and this brain, differing in each individual from all others as widely as do their features, statures, forms, and complexion,—how, in the name of reason, can any such phantasy as “common” sense exist? Why the “Very Reverend Dean Swift” was not only as ignorant of the meanings of words as a

king or a nobleman, but as ignorant also of the organization of human bodies as any parson need be!

But excusing him all these blunders as kindly as if he had been born to an immense patrimony, we arrive at last at *his* meaning of the words under review. By “fine sense” he probably intended a knowledge of the fine arts, of literature, and the belles lettres, and that species of mental cultivation usually understood to constitute an accomplished mind. By “exalted sense” he most likely signified a religious bent of mind; for exaltation is rarely coupled with aught but so-called divine matters. Of “common sense” his definition would probably have been, “that *sense* which enables men to perceive the relations, &c., of surrounding things, about which all men are agreed.”

Setting this presumed signification upon Swift’s sentence, we all may allow him the justice and truth of it, for it is, beyond the possibility of denial, true, that he who comprehends the causes and consequences of surrounding circumstances, who marks the progress of events, and lends his aid in promoting the public good, is by far a more useful member of the community than he who spends a lifetime in the acquirement of mere accomplishments, and, by a much larger difference, than he who assumes a sanctimonious demeanour, and devotes his existence to affairs of supposed godliness!

Thus I conclude my examination, and I know not that I should have selected this sentence, but really when “Reverends,” with the awe-filling prefix, “Very,” write such senseless sentences, and thoughtless biographers take the trouble to hand it down to an ignorant posterity, it seems highly necessary to expose the fallacy, even at the expense of tarnishing a name of wisdom.

ANALYST.

[Fine sense and exalted sense, in a rude age, are of little use to the individual possessor; but fine sense and exalted sense, universally diffused, are the richest blessings of heaven. All species of perfection advance contemporaneously. Before one sense or one science can be perfected, all must be perfected; and before fine sense and exalted sense in an individual can be universally appreciated, all must be possessed of them; and when all are possessed of them, they are then *common sense*.]

FIRST OF NOVEMBER; ALL SAINTS’ DAY.

This day is a festival, which is held in honour of all the saints. It was first established by the tyrant Phocas, in 607, when he took possession of the Roman Pantheon, which till then had remained in the hands of the pagans, and been appropriated to the service of *all the Gods*. *All Saints’ day* is, therefore, the lineal successor of *all Gods’ day*, and consecrated to St. Marv la Rotunda and all the blessed of both sexes, as the heathen festival was consecrated to Cybele the mother of all the Gods. Mary is the Christian Cybele, the queen of heaven, the mother and bride of God, a representative of Nature, our common mother. Mary signifies a lady, or the *sea*, which is the mother of the dry land, the womb of creation.

This festival was held by the Romans on the first of May, and the Christians retained the same day of celebration for more than two hundred years; when Gregory IV. transferred it to the corresponding opposite day of the year, the 1st of November, six months later.

The Eve of All Hallows, or Hallow E'en, is a memorable day throughout all Scotland; but it is regarded more as a festival, which is consecrated to the interests of lads and lassies, and the revelation of the future destinies of the lovers, than a commemoration of the virtues of the saints. Many a foolish rite is performed more for amusement than from any real expectation of lifting up the veil of futurity, and discovering things to come.

On this day, also, is held *All Souls' day*. It happens on the 2nd of November, but when the 2nd falls on a Sunday, the festival, unlike all other festivals, is held in the preceding day. This is done in order to show as much haste as possible in relieving the suffering souls in purgatory. In former days every Sunday morning, during the preceding month, persons dressed in black used to walk about ringing bells, and reminding the inhabitants of the solemn duty they had to perform to their afflicted fellow creatures, who were suffering the tortures of the damned, and only wanted the contributions of the faithful to the priestly coffers to release them from their troubles; for it could not be expected that priests would contribute their services gratis, as the people their money; and Jesus Christ himself, having paid a ransom for others, was resolved that others should pay a ransom to him, before he would unlock the adamantine gates of hell, of which he keeps the keys. (Rev. i. 18.) This festival, also, is merely an old pagan festival christianized. The Romans called it *Feralia*, because then they carried feasts to the tombs of the dead whose souls were supposed to be released, and wandering up and down feasting upon the luxuries which their surviving friends provided for them. They held it in February, and it continued eleven days. The popish legends inform us that this festival was ordained by St. Odillon, Abbot of Cluny, who in the isle of Vulcan or Sicily, no doubt in the neighbourhood of Mount Etna, heard the voices of devils complaining sadly that the souls of the dead were wrested from them by means of alms and prayers.

Much of the offerings of the faithful was spent upon this pious service, and those who were at the point of death understood no better method of making their peace with God, than leaving a bequest of land or money to be appropriated to the chanting of requiems and other holy mummeries, for the sake of themselves and others departed. By these means the church secured the greater part of its present property. This custom of bequeathing property to the church had increased to such a corrupt and extravagant degree as to give rise to a proverb, which sounds rather impious in delicate ears,—“Happy is that son whose father has gone to the devil;” that is, happy is that son whose father has forfeited the favour and the prayers of the church by securing all his property to his own offspring. The impiety is all in the *sound*, and not in the *sense*. The same may be said of many other species of impiety, vulgarly so called.

The Duke of Ossuna, when ambassador to the king of Spain, during the pontificate of Innocent XI., was supplicated for charity by a mendicant friar, “Put a pistole in this plate, my lord, and you will release that soul from purgatory for which you design it.” The duke complied, and was soon assured that his piety had been effectual. “Say you so, holy man?” replied his grace; then I shall take back my money for a future occasion, as you cannot, *nor would you, I am confident, if you were able, again condemn the poor soul to its former endurance.*”

Frederick the Great, of Prussia, was desirous of recovering the revenue of a forest which had been bequeathed by his progenitors for a similar purpose, and he

demanding of the “Religiosi” by what authority they appropriated it to themselves. They replied that it was given to the *Holy Brotherhood* upon condition of their saying masses daily for the repose of one of his majesty's ancestors. “And how much longer,” said Frederick, “will that holy work continue requisite?” “Sire,” said the cautious prior, “it is not possible for me to speak of the precise time; but when it shall become unnecessary, *I will instantly dispatch a courier to inform your majesty.*”

This Saturday is peculiarly sacred to unity, inasmuch as it unites all the saints in heaven and all the souls in hell; the two anniversaries being this year celebrated on the same day.

UNITY OF THE FIVE SENSES.

THE five senses are tasting, smelling, seeing, hearing, and feeling. The four first senses are local; that is, they are confined to certain organs in the head. Feeling is universal over the whole body, and therefore contains all the senses within itself. The other senses are merely modifications of feeling. Taste is the sense of feeling in the mouth; smelling is the sense of feeling in the nose; these three are the sensual or unintellectual department of sense; feeling, seeing, and hearing constitute the other department.

The impressions produced upon this universal sense are infinitely variegated—strange tastes, strange sounds, sights, are frequently occasioned by some peculiar affection of the nervous system, or organs of feeling. Animal magnetism has performed many singular experiments, which have baffled the ingenuity of science to account for; and Nature is frequently and repeatedly bringing forth extraordinary phenomena of human organization, which are so far removed from the ordinary character of humanity, that our gravest philosophers, being reduced to the last extremity of wit, have no other resource left but the vulgar cry of “Impostor, impostor!”

The following case made the circuit of the French papers a few years ago, and a case of a similar nature was publicly exhibited in London about three years since, in Egyptian Hall. Colquhoun, in his late History of Magnetism, mentions many other instances of individuals in whom all the senses were reduced to unity; and hearing, seeing, and tasting, performed through other mediums than either the mouth, ears, or eyes.

A very learned French physician, and writer in the *Journal de Santé*, gives the following account of a woman in the neighbourhood of Lyons:

“To believe,” he says, “in apparent impossibilities, is often the necessity of men of science; but it is their good fortune likewise to discover that the world contains many more miracles than is at first imagined; that nothing is impossible, as referred to the omnipotence of the Deity; and that impossibilities are much rarer in the combination of human life than the vanity of science will acknowledge.”

“The woman whom I visited, and to whom I presented several sorts of medicines, powders, simples, compounds, and many other substances, which I am convinced she never saw before, told me their several tastes, as nearly, and with as much precision as taste could pronounce. She described them, indeed, with astonishing exactness, and frequently when my own palate was confounded.

“Her eyes were next bound with a thick bandage, and I drew from my pockets several sorts of silk riband. All those that differed in the original colours, she immediately told me. It was in vain to attempt puzzling her; she

made no mistake ; she passed the riband merely through her hand, and immediately decided on its peculiar colour. She could, in fact, discover the qualities of any thing by the touch or taste, as accurately as I could do with my eyes.

"The organs of hearing were then closed, as well as the contrivance of stuffing the ears would answer the purpose. I then commenced a conversation with a friend in the apartment, and spoke in almost inaudible whispers. She repeated, with great power of memory, every word of the conversation. In short, I came away a convert ; in other words, believed what I had seen. A philosopher knows the fallibility of the senses ; but he should know, likewise, that science ought not to reject because it cannot have demonstration."

PHYSIOLOGY OF BIRDS.

THE systems of circulation and respiration, in birds as in other animals, are closely connected, though not so much so as in the mammalia. The circulation in both is performed by means of a double heart, consisting of two ventricles for propelling the blood, and two auricles for receiving that fluid on its return ; and connected with these, as in all animals that have the heart double, there are two sets both of arteries and of veins,—a pulmonary set and a systematic one. The circulation is, as has been hinted already, more rapid in birds than in the mammalia, which agrees with the greater violence and longer continuance of some of their actions. But though these more violent actions,—such as coursing on two feet as fleetly as antelopes do on four and with the aid of the flexible spine and its muscles, as in the ostrich, plunging into the water like the gannet or the cormorant, dashing through that element like the divers, cleaving the air beyond comparison with all terrestrial speed, as in the plovers, the swift, or the pratincole, or breasting the tempest with the majesty of the eagle, require, and are furnished with a supply of blood, proportional to the waste which their great energy must occasion ; yet they are by no means so well suited to an equally rapid breathing by means of lungs. But the application of renovating air to the blood must, in all animals, be proportional to the circulation ; and, among vertebrated animals, it is only the reptiles and fishes which have the temperature low and the circulation lagging, and which spend much of their time in a state of comparative inaction, that can carry on their systems in a healthy state with only a partial aëration of the blood.

And the means by which the action of the air on the blood of birds is rendered equal to the rapidity in circulation, and consequent necessity of vital repair, in that fluid, without the painful fatigue of ever-panting lungs, is made, like all other contrivances in nature, to answer other important purposes at the same time. The lungs of birds are ample in their dimensions, and have the cells into which the air is admitted larger than in the mammalia ; and they are kept in their places by being fastened to the bones. Ramifications extend from them in tubes and cells through the whole cavity of the body, into the hollows of the bones, and, in short, along the course of every artery which is not immediately imbedded in those muscles, which are in action during the violent exertions of the bird. The blood-vessels in these muscles are fewer than those in the muscles of the mammalia, as any one may infer from the greater rigidity of their texture, and the whiteness of their colour. Thus, there is not a blood-vessel of any considerable size in the whole body of a bird, to the coats of which the air has not access during the greater part of their course ; and thus the real

action of breathing in birds is not concentrated into one organ, to be toiling and panting there, as it would be in the lungs of the mammalia, but distributed over the whole circulation, and consequently diminished in local intensity, in proportion as it is extended over a greater surface.

This is a subject which it is impossible to bring to the test of numbers, so as to compare accurately the diminution of local action by means of the general access of air to the blood-vessels. There are two difficulties, neither of which can be, from the great nicety of observation which they would require, overcome. In the first place, we know not, and we cannot ascertain, the relative surfaces of the blood-vessels exposed to the air in lungs only, and in the whole system, as in birds ; and, in the second place, we know not the difference of action which the air may have on the coat of a very small blood-vessel, such as those in the lungs, and that of a larger one. We do know that the exposed surface of the vessels in the lungs must form but a small portion of that of the whole vessels in the system, because in the freest breathers, that is, what is usually styled the "longest winded," of the mammalia, which have their blood aërated in the lungs only, or chiefly, the portion which passes through these organs at each respiration of the breath, is only a small fraction of the whole. We know also that the coats of the larger blood-vessels must, in order that the vascular system may have equal strength in all its parts, have their coats much thicker and firmer than the smaller ones, though we cannot precisely say in what proportion ; neither do we know to what extent the difference of thickness in the coats of the vessels diminishes the action of the air upon the contained fluid. Perhaps the thickness of the coats is directly, and the action of the air inversely, in some such ratio as that of the squares of the diameters of the different vessels ; but this is a mere theoretic guess, undemonstrated, and incapable of demonstration.

Analogy shows, however, that the advantages which birds derive from this general admission of air to the blood-vessels is very great. The race-horse is quite fatigued with a few miles at his full speed, and so is the greyhound, while the lion himself is in need of repose after a single leap. But birds can maintain their rapid flight during the livelong day, and for hundreds of miles upon the stretch ; and when they do, as is sometimes the case, drop down in agitation or in exhaustion, the former seems generally to be the effect of fear, and the latter of muscular fatigue, for they do not pant as the mammalia do when they have over-exerted themselves.—*British Cyclopædia*.

CORRESPONDENCE.

There are some good ideas in the Lines on the Destruction of the Parliament Houses, but the poem as a whole is rather laboured. The last lines are the best, which is rather a good omen, and show that the writer was beginning to fire with his subject, at the very time when he put on the extinguisher.

Thy splendour and thy glories, where are they?
The boast of ages wither'd in a day.
Gaunt ruin now usurps their pride of place,
But leaves behind some solitary trace,
That doth with scornful mockery disclose
Where late the imperial dome of greatness rose.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 11.]

SATURDAY, NOVEMBER 8, 1834.

[Price 1d.]

SYSTEM OF NATURE.

WE shall now, for the sake of a little variety, proceed to analyze some of the most remarkable features in the progress of society. We have already laid down some of the numerical principles on which Nature conducts her operations, and we shall from time to time communicate farther information on the same subject. What we have said already, will suffice as a guide to the thorough understanding of the views of the progress of Nature which we mean to delineate.

All Nature is divided into two great departments, which, for the sake of simplicity, we may at present call evil and good; and the progress of Nature, or society, is consequently distinguished by these two stages. Hence it follows that there must be an old world and a new world, a vicious and a virtuous world. The one is a regular descent, the other a regular ascent—Satan and God, darkness and light.

Satan is called the prince of this world, and the prince of darkness; "and the whole world lieth in darkness." But a time is to come when "Satan is transformed into an angel of light," or, in other words, is destroyed.

The first stage is bondage, the second is liberty; or law and liberty, which are the two extremes, both of which are evil when carried to excess, yet when properly combined are good; but in common language we always call liberty good. They are nominally opposed to each other; the greatest enemy of liberty being law, and the greatest enemy of law being liberty.

Well, suppose you call Satan the representative of one of these, and God the representative of the other. They are nominally two enemies. When the one gives a law, the other rebels against it. Thus Adam was commanded by the one *not* to eat, but the other persuaded him to disobey. The first was the law, the second the liberty of Nature. But by disobeying, Adam attained knowledge; he became acquainted with both extremes, without which he could have knowledge of neither. Hence, the Serpent very truly said, "if you eat, you shall not die, but shall be as gods," &c.; all which was literally correct, much more so than the words of Jesus Christ, when speaking of a dead woman: "the maid is not dead, but sleepeth." This story of the fall very beautifully illustrates two important points,—the necessity of law, and the necessity of rebellion. Without law we could not preserve order in society, and without rebellion we never could accomplish any reformation. All reformers are rebels. Satan was the first rebel, and he introduced knowledge, experience, &c. Adam followed his example.

Moses was also a rebel; he rebelled against the king of Egypt. Jesus Christ rebelled against the established usages of his country. Martin Luther, John Calvin, Zuinglius, John Knox, &c., were all rebels against the church and state of the age and country in which they lived. Earl Grey and Lord Brougham were rebels against the old British Constitution. Richard Carlile, Robert Owen, Henry Hetherington, and Benjamin Cousins, and all Dissenters, are rebels against Henry Brougham, &c. All belong to the same school; all disciples of the great prince of all rebels, the Serpent that beguiled Eve in the garden, who is set up as a model of wisdom for men to follow by the authority of Christ himself,—“Be ye wise as serpents”—and we ourselves are only following this high authority in rebelling against existing institutions and systems of doctrine. The fall of man is a regular continued course of rebellion, which must go on until truth and justice are established on the earth. Who ever heard of legislators amending their codes of law, without being spurred on by rebels? Rebellion, then, against evil is a virtue, and there are very few instances of any other kind of rebellion to be found in the records of history; we owe all the progress of political and religious society to rebels only.

Man was first without law, then the law came; then he broke the law, and this last is his present position. When he has found out the means of associating law and liberty in such a manner that they shall be identified the one with the other; and men, enlightened and moralized, and respected by the institutions of their country, shall even, when left at liberty of action, do those things alone which the law itself shall dictate; then he has attained the full vigour of manhood, the knowledge of good and evil, to which nothing but the severities of law and the obduracy of rebellion could have brought him.

This simple truth being demonstrated, which even a child may comprehend, we look for a development of it in the history of principles and opinions, or in other words "the church." We accordingly find that the great, all-prevalent, victorious religion which has planted its colours on all the thrones and institutions of the civilized world, contains in succession the law and opposition to law—law and liberty—or law and gospel. The one says, "Do, and ye shall live;" the other says, "Ye shall live, whether ye do it or not."

The law says, "Sacrifice and offering, and burnt offering, &c.;" the gospel says, "Neither sacrifice nor offering, nor burnt offering." The law says, "Revenge—an eye for an eye, a tooth for a tooth;" the

gospel says, "Avenge not yourselves ; resist not evil," &c. The law says, "Ye are justified by works ;" the gospel says, "Nay, it is by faith." The one is full of rites and ceremonies innumerable ; the other enforces no rites nor ceremonies whatsoever. The one prescribes certain meats and drinks, modes of apparel, and other formal restraints ; the other removes the yoke which its predecessor had put on, and grants a bill of general emancipation from the slavish bondage. In fine, the one is a complete counterpart to the other ; therefore the apostle of the Gentiles says, "Stand fast in the liberty wherewith Christ hath made you free, and be not entangled again in the yoke of bondage." The two churches thus present a perfect resemblance of law and liberty.

You will now naturally enquire, "If the gospel be an emblem of liberty, why is it so full of misery?" The answer is so very simple, that there is little occasion for us to give one, if our readers have not forgotten our former analysis of the two extremes of Nature. Both extremes are evil. Law is evil in the hands of the ignorant, who subject the ignorant ; for then it becomes tyranny, monopoly, division, and misery. Liberty is evil in the possession of the ignorant ; for then there is no control, no order, no justice between man and man. It is anarchy, and only tyranny after all. Thus Christianity, which began without law, has ended in a most complicated system of political and ecclesiastical legislation. It is only a proper union of both, in an age of general illumination, that can secure the tranquillity of political and social life. This is the third stage ; and accordingly the present stage of Christianity has always been represented as evil and temporary : it is called Antichrist, the Mother of Harlots, Babylon the Great, the Beast, the False Prophet, and many other opprobrious names ; and it is doomed to final destruction, like its predecessor the law, to give place to a better, a universal and everlasting system. All this is unquestionable ; no man can gainsay it ; from which it follows that the present Christianity is both right and wrong ; right in its place, as a temporary herald of a better ; wrong, as a pretender to stability and perfection. But it will come to an end—not by those who call it false (they cannot overturn it, or pierce even the skin of it)—but by those who reform it ; who acknowledge it as a great important stage of the progress of society, true in its ultimate meaning, but false in its clerical meaning ; just as Judaism is accounted by Christians true in its Christian meaning, but false in its Jewish meaning. To depart from this law of progress is to make a break in the chain of succession, to do violence to Nature's laws, and all the principles of philosophy. Hence vulgar infidelity is unphilosophical and absurd, and never can maintain its position or advance beyond a very limited sphere of thought.

Nothing can be more beautiful and more philosophical than this arrangement of the churches. It is in strict conformity with the first principles of natural science, and most satisfactorily accounts for the studied and determined contrariety which exists between the law and the gospel. The Reformers and Infidels of the French school being entirely ignorant of the science of "Pro-

gress," or at least not taking it into account in their analysis of the progress of Nature, where it ought to have been remembered if they had known it, have frequently adduced this glaring contrariety as an evident demonstration of the absurdity and falsehood of the whole. They might just as well adduce the opposition between darkness and twilight as an evident proof that the sun will never rise. They know not, or are determined not to know, that during the night, men see by star-light and candle-light ; in the dawn, by the refraction of the atmosphere ; and in the day, by the sunshine ; yet all these lights have one great source, which, though unchangeable, is ever varying, and moving from one extreme of darkness to the other extreme of sunshine. According to this simple model, what can we expect but a species of star-light, almost total darkness, during the law ; some glimmerings of light during the gospel ; and sunshine during the last or millennial stage? The change is the change of progression, and is an argument in favour of the system attacked, inasmuch as it proves it to have a growth, like all animated Nature, and not to be still-born, or dead like a stone.

But it may be replied, that Mahometism is the third stage in progress, and therefore ought, according to this model, to unite the two extremes alluded to. We refer it to any one acquainted with its character, to say whether it is in the direct line of progress or not. It acknowledges Abraham as its father, no doubt, and it nominally acknowledges all the prophets of Judaism, and the apostles of Christianity ; but it has totally rejected the books : its disciples have no knowledge whatsoever of the two great predecessors of their faith ; they are entirely insulated ; they stand alone in the world of opinion, like all the other religious sects on the earth ; it is an offshoot of Christianity, but no more ; it is not a successor, not an heir, not a free, legitimate son, but a bond son, a bastard, as we have shown in a former number ; hence, it is not in the legitimate line of progression. Not so with the Christians ; they are all as well acquainted with the books of the Jews as with their own ; they have preserved the growth and inherited the spirit of the olden times ; and with that growth they have the growth and inheritance of science and the arts combined. The line of progress runs through Christianity, and through it alone ; and Protestantism is the last great stage in the line of progress, for which reason it is in the seat of Protestantism—in the capital city of Protestantism, the very heart of the last-born beast—that the great work of regeneration can begin. France is a stage behind ; she is a Catholic country ; she never can accomplish it ; she rejects as an infidel, but does not reform as a philosopher. America is nothing at all ; she is not an Ecclesiastical polity, and is out of the old world. There is only one country and one city to which the finger of fate doth point ; and we can predict the result with as much certainty as Francis Moore himself can predict an eclipse of the moon, or Dr. Farraday the result of a chemical combination upon which he has previously experimented.

There is a certainty in the science, because it corresponds with all the history of the past, and the whole philosophy of Nature. Let any man refute it who can ; let

him point out a blemish in it, and we have done with it ; if not, let him promote its circulation, and have done with sectarianism for ever.—We shall continue our analysis in our next, and enter more into particulars, demonstrating, as we proceed, the important truths contained in the greater and lesser systems, and the indispensable necessity there is that these truths should be known before any favourable change can be effected ; for without unanimity upon religious subjects, it is impossible to institute any political system which shall not prove a curse to the great majority. Religion is really a department of politics ; it cannot be got rid of. You may overthrow the Church Establishment. What then ? Your legislators are still sectarians ; one is an Episcopalian, another a Presbyterian, another a Roman Catholic, another a Wesleyan Methodist, and another an Infidel or an Atheist. Will these men agree ?—never ; their different creeds teach them different politics, different morals, different modes of discipline, which will inflame the country with an everlasting succession of petty controversies, and provide fuel for the meanest and most cruel of passions, prejudices, and aversions.

THE SHEPHERD.

HEAT AND COLD.

HEAT and cold are generally understood to be two different effects produced by the same cause. For a long time it was considered indisputable that they were two distinct substances. Fire or heat was denominated one of the four elements of Nature—an omnipresent principle, which had a distinct and independent existence. This idea, however, like every other, which proposes to disunite the unity of Nature cannot withstand the test of experiment. Fire cannot exist without support of some kind. It can neither burn nor give light unless it be collected together by some material fuel. The light of the candle cannot exist without the wick and the grease—and the lightning of heaven is only the atmosphere ignited. The electric fluid in a vacuum created by an air-pump gives a faint purple light ; but it is questionable whether the vacuum be perfect or not. But even the electric light is the effect of the two sexes of the electric principle in union. Hence it appears that heat is as much an effect as a cause—and without doubt the best idea that we can form of it is, that it is both cause and effect—active and passive—male and female.

There are many very simple methods of demonstrating this. Thus, for instance, red heat may be created in a piece of iron by beating only. A clever smith may beat a nail red hot, and then kindle a fire with it. This fire, therefore, is the result of friction, which friction first occasioned the mutual action of the two omnipresent elements on each other. The fuel maintained the action by supplying a material which is easily decomposed by fire, and contained in abundance the gases which nourish it. When this action ceases, the material becomes cold ; we say the heat has gone—but nothing has gone but the action, unless the material be burned to pure dross or charcoal. The cold, therefore, is merely the absence of that action which creates heat, and is produced by another ac-

tion of the very same elements by which the heat is created. The action of heat distends or enlarges bodies ; cold contracts or diminishes them. They are merely two opposite movements of the same cause. Thus a piece of iron becomes larger and softer by heat—smaller and harder by cold. When heat is increased to a certain amount, it decomposes the body, or changes its Nature. It converts metals into fluids by melting them. It converts fuels into gases ; but makes no impression on pure carbon.

For some time past it has been customary to apply the name of Caloric to this unknown principle of fire, in order to get rid of the idea of effect, which the word heat implies ; but it is evident that the vulgar word “heat” is much more philosophical than the other, merely because it conveys the idea of both cause and effect. In the ignorance and infancy of science, men naturally imagine a specific and independent cause for every effect ; they have no idea of the infinite variability of Nature, who modifies the action of her simple elements so as to produce the most opposite effects by the same agents. A very beautiful illustration of this mysterious skill of our bountiful mother may be given in the following simple experiment.

Put a little ether into a vial, and put that vial into a tumbler of water ; then put both into the receiver of an air-pump, extract the air, and you will find two most contradictory effects produced upon the ether and the water ; for the ether will boil, and the water will be converted into ice. The ether boils merely because the pressure of the atmosphere is removed, and by boiling it gives out its heat in the shape of steam. By giving out its heat, it naturally extracts more heat from the water ; and the water by losing its heat is converted into ice. This seems to imply that heat is one substance, and cold another ; but the same analogy subsists between pleasure and pain ; thus a little heat is agreeable to the body ; an intense heat is painful. We call pain and pleasure two distinct or opposite feelings, yet the same cause produces them, the same nervous system experiences them.

As we can produce heat by friction and fuel, so also we have it in our power to produce cold by certain mixtures. We can even exceed by artificial means any degree of intensity which is produced directly by Nature. We can freeze any liquid except alcohol, which contains too much of the active principle of heat within it ever to be subjected to the process of solidification. Three parts of muriate of lime, mixed with two parts of snow at 32 degrees, or the freezing point, will create a cold 50 degrees greater than the snow itself. Snow and salt produce a very intense cold, as low as zero, or 0 in the thermometer. Now it is evident that the cold is not produced by the emission of heat, as the frozen water in the former experiment ; for, on the contrary, cold is emitted, and that immediately. This seems an evident proof that the cold is produced by one chemical action, and the heat by another.

Heat expands bodies, and cold contracts them. Hence there is more heat in steam than in water ; for steam is water distended by heat. This fact has introduced many important improvements in the arts of life. The steam which used to be wasted and dissipated in air, is now col-

lected and made instrumental in the saving of fuel. The steam of a boiler transmitted by pipes to any vessel of water, will boil that water without the aid of fire; and a quantity of water in steam will convey a greater quantity of heat than the same quantity of boiling water. Hence baths are usually heated by steam-pipes instead of hot water.

Boiling is occasioned by the conversion of the liquid into steam—the steam is created at the bottom of the vessel, and, being lighter than water, it rises in bubbles to the top. Every liquid has a certain temperature at which it boils. Ether is the most evaporable of all liquids. It boils with a summer heat. Water boils at 212° , sometimes 210° , sometimes 214° , according to the density or rarity of the atmosphere; mercury at 656° . These are the highest temperatures they can acquire, unless by artificial pressure, which confines the vapour that is emitted; by this pressure water may be made red hot. Were our atmosphere denser than it is, it would take more heat to boil water; and if rarer, it would take less. Hence we find that on the tops of the highest mountains water boils at a lower temperature than on the plains. Saussure found that water on the top of Mount Blanc boiled at 187° , instead of 212° . If water at about 100° , or what is called blood-heat, be put into the vacuum of an air-pump, it boils immediately, without receiving any additional heat. In this manner syrups are often boiled; for it has the advantage of evaporating the syrup and bringing it to a proper consistency, without burning it, only the vacuum is produced by a much simpler process than the air-pump.

From this it is evident that the pressure of the atmosphere is a principal cause of the existence of fluids. Were that pressure removed, they would evaporate and form a new atmosphere; and if the new atmosphere were removed as soon as it was formed, the earth would then lose all its moisture, and be reduced to a lump of dry carbon. What other process would then take place we cannot tell.

ALMANACK.

ALTHOUGH the terms calendar and almanack are in general regarded as synonymous, there is, nevertheless, a material distinction between them.

The calendar, strictly speaking, refers to time in general—the almanack to only that portion of time which is comprehended in the annual revolution of the earth round the sun, and marking, by previous computation, numerous particulars of general interest and utility; religious feasts; public holidays; the days of the week, corresponding with those of the month; the increasing and decreasing length of the day; the variations between true and solar time; tables of the tides; the sun's passage through the zodiac; eclipses; conjunctions and other motions of the planets; &c., all calculated for that portion of duration comprehended within the year. We may with propriety use calendar or almanack for any particular year; but, as allusive to time in general, calendar can alone be properly applied. In speaking of an alteration in the French calendar, we are clearly understood to mean some general improvement or alteration in the calculation of time in

France; while an alteration in the French almanack would be understood only as implying a new mode of arranging the different computations and notices adapted to one year. The calendar denotes the settled and national mode of registering the course of time by the sun's progress; an almanack is a subsidiary manual formed out of that instrument.

Numa marked the distinction between the calendar and the almanack by his invention of the fasti, of which our almanack is a close resemblance, in order to make known the annual routine of public and religious ceremonies, dependent on his regulation of the calendar: and although no private individual ever did or could attempt to change the calendar, every person who thought proper could frame an almanack; and this privilege has been exerted to so great an extent, as to call forth public acts to regulate and limit their publication.

We have also a more accurate and minute computation of time, known by the name of an ephemeris, in which, as the name indicates, the daily variations in the planets, the apparent positions of the fixed stars, and other celestial as well as terrestrial phenomena, are minutely recorded, for the especial purposes of navigation, and the facilitating the study of astronomy.

Judicial astrology, or the pretended power of predicting future events, was professed at a very remote period; and almanacks—not calendars—made the principal medium of circulating their absurdities. So early as the year 1579, Henry III. of France issued an edict, that “none of that tribe should for the future presume to publish predictions relating to affairs of the state, or of private persons, in terms either express or covert,” &c. The planetary system was generally made the groundwork or foundation of this abstruse species of plausible imposition; but as the influence of the sun and moon was too sensibly felt to admit of mysterious deception, these pretenders to supernatural knowledge did not select these luminaries as objects for their impositions on the superstitious; and hence the other planets, whose influence, if any, was not obvious to the senses, were made the foundation of this delusive art; and being named after deities of the heathen mythology, but little ingenuity was necessary to imbue the planets with powers and attributes ascribed to those objects of heathen worship, whence they derived their names; thus opening a boundless field for practising upon the credulity and superstition of mankind, which even to this day, with all our advances towards perfection in science, and manifest advantages in point of intellectual acquirement, are not yet wholly eradicated.

In the highlands of Scotland they form their prognostic or presage of weather on a superstitious, but innocent conceit, that the year will be governed as to its general fluctuation, by the state of the twelve days beginning from the 31st of December: thus if the 31st of December should be fair, so will the ensuing January; if the 1st of January should be fair, so will the succeeding February; if the 2d of January, &c., so will March be found, and so throughout the year. Various persons still implicitly believe in these auguries; but it is to be hoped the weather in general in the highlands will be found

rather more favourable throughout the different months, than can well be expected from an observation made on the days they have selected in the very depth of the winter season.

The etymology of the word almanack has been, perhaps, the subject of more dispute than that of any term admitted into our language. With the single exception of Verstigan, all our lexicographers derive the first syllable *al* from the article definite of the Arabic, which signifies *the*; but the roots of the remaining syllables are variously accounted for, some taking it from the Greek *manakos*—a lunar circle; others from the Hebrew, *manach*, to count; Johnson takes it from the Greek, *men*, a month; but why the first syllable should be in one language, which these authorities agree in, and the two last in any other language, is not easy to comprehend. Whether, therefore, the Saxons originally took their term from the Arabic, either wholly or in part, Verstigan seems to be the most relied on: “They,” he says alluding to our ancient Saxon ancestors, “used to engrave upon certain squared sticks, about a foot in length, or shorter or longer as they pleased, the courses of the moones of the whole yeere, whereby they could alwaies certainly tell when the new moones, full moones, and changes should happen, as also their festivall daies; and such a carved sticke they called an *al-mon-aght*, that is to say, al-mon-heed, to wit, the regard or observation of all the moones, and here hence is derived the name of almanack.”

The Danes, Swedes, and Norwegians appear to have used these almanacks, though under various denominations, such as, *reinstocks*, *runstocks*, *runstaffs*, *primstaries*, *scipionees*, *runici*, *bacculi*, *annales*, *staves*, *stakes*, *cloggs*, &c., by the last of which Dr. Plott calls the specimen he has described; and they appear to have been introduced into this country at the Norman conquest.

Before printing was introduced, and when manuscripts were scarce and dear, these runic almanacks were particularly useful in assisting the memory. In all visits to distant churches, in all pilgrimages, &c., they were made the instruments of instruction and regularity; and that they might be doubly serviceable, they were frequently carved on the tops of pilgrims’ staves, or stakes, so as to regulate their times of assembling at particular spots, and also to support them in their wearisome journeys. These runic almanacks, like others in manuscript, bore the characters of pagan superstition until about the fourth century, when they partook of both heathen and Christian emblematical devices, so as to be more generally saleable; but after the seventh century, they became wholly Christian, and that they might be made as universally serviceable as possible, they were sometimes cut on sword scabbards, implements of husbandry, &c. &c.

Those immense square pillars or obelisks in Egypt, the hieroglyphical characters on which have so much perplexed the learned, have been considered as containing directions for the monthly rural labours of the Egyptians, and consequently to have been the first species of almanack ever used, of which the runic staves before-mentioned are but very humble imitations, though of somewhat similar construction: and when the repetition of

the same figures or characters on each of those vast pillars is considered, which would perhaps never have been so uniformly alike, unless for some such general and extensively useful purpose; the titles assigned to them by the Egyptian priests, of “fingers of the sun,” to which orb they were usually dedicated; and the nature of the stone of which they were composed, being of various colours, and regarded as typical of the four elements, there is good reason for concluding that they were intended as almanacks rather than as histories of their sovereigns, or for any other of the uses that have been assigned them by the ingenuity of antiquaries.

There does not appear to be any trace of the original inventors of almanacks, whether in wood, in manuscript, or in print; the first in print is generally admitted to be that of John Muller, of Montereccio, better known by the name of Regiomontanus; this person opened a printing house, and published his first almanack at Nuremburg in the year 1472, wherein he not only gave the characters of each year, and of the months, but foretold the eclipses, &c., for thirty years in advance.

The first recorded account we have of almanacks in this country, appears in the year-book of Henry VII., or about fifteen years subsequently to that of Muller; though Mr. Jackson, of Exeter, in a work published by him, says, “I have in my possession an almanack made in the reign of Edward III., of parchment, being about one hundred and forty years prior to Muller’s, not in the usual form of a sheet, or a book, but in separate pieces, folded in the shape of a flat stick, or lath, in the Saxon fashion: it is perfectly fair, and exhibits the best specimen of ancient numerals I have yet met with.”—*Clavis Calendaria*.

A SHANDEAN MINISTER.

—Now, were I the King of Great Britain—said my father, taking his pipe from his mouth, and blowing with as much force as his cheeks were capable of blowing with, a whiff as thick and spreading as if it had escaped from the funnel of a furnace,—were I King of Great Britain,—(for it is a nation of gallantry—and spirit—and genius; as well as of folly—servility—and dupe-dom)—my Prime Minister should be a *man*, and not a being who would look with indifference on the female sex.—My uncle Toby shook his head—it was a movement of something like sorrow;—the word *gallantry* brought the idea of an *engagement* into the mind of my uncle Toby—the idea of an *engagement*—put him in recollection of his *wound*.

—How does the widow Wadman, Mr. Shandy?—Ask my uncle Toby, Madam.—He should be a *man*—continued my father—with all his faculties about him—mental and corporeal;—so that he might be the proper Minister—in the proper place—the Minister of War—when War was necessary to our political existence—the Minister of Peace—for that is *absolutely necessary*—the Minister of Love—for population is the riches of a state.—

Doctor Slop looked at my father—then at his green baize-bag—then at my father again;—there was *professional* gratitude in every movement.

—He should be—said my father—(still continuing his picture)—the best and wisest man in my dominions.—Generosity should dwell on his countenance;—

he should look the Minister of all that's great and good—not the Minister of *Mammon*—or the Minister of *Bacchus*, Toby.—I am satisfied, to the fulness of my conscience, that a Minister should be the father of a people;—and, to be the father of a people, he should be the father of a family.—

My uncle Toby sighed—

What did he sigh for, Mr. Shandy?—

Ask the widow Wadman, Madam.

—He should feel the sincerity of heart-felt joy,—on beholding every individual of that family—with a smiling and contented countenance—(when I speak of his family, Toby—I likewise mean it as the *epitome of a State*.)—He should be liberal and benevolent, yet frugal—courageous, yet peaceful:—one, that would not sport with the life of his meanest creature—nor his cat—nor his dog—much less the lives of the *members of his family*.—He should be a man of strong mind—and *sound memory*—I should not care for what was conceived to be the *bad acts* of his *boyhood*;—but, if ever he forget his bad acts—

He should forget his bad acts—quoth my uncle Toby.—He should cease to *practise them*—replied my father emphatically;—but if ever he *forget* his bad acts, 'tis ten to one but he'll forget his duty to perform good ones—for it is by remembering our faults, Toby,—and the shame that ought to be attached to them,—that puts us in a position to resist the attacks of vice, and of present and future temptation.—Temptation, brother—quoth my uncle Toby—is an enemy that mostly comes upon us by stolen marches.—Therefore, Toby—(replied my father in my uncle's style)—it is necessary to *review our works*,—and always be on the *defensive*.

This was patting the neck of my uncle Toby's hobby-horse.

He should not be (said my father, resuming his discourse)—he should not be a vane, Toby, that shifts with the gale of selfish fortune—he should act as a *conductor*—to draw off the lightning, and preserve the fabric that it is fixed upon.—In this manner, Toby, he might fortify the strong-holds of a free nation—and always be in a posture to *chastise* her enemies.

Pray, brother—quoth my uncle Toby—what is a Conductor?

It is a *metalline rod*, Toby—replied my father.

I should think brother—said my uncle Toby, looking looking up gravely into the face of my father,—that the metal of one *culverin* would be a greater defence—and chastise our enemies better than a thousand *rods*: and, besides, brother, they could only be used at close quarters—

My uncle Toby paused for a few seconds.—He was contemplating, with his cheek resting on his left hand, and his eyes fixed on the table—then, suddenly raising his head, and looking my father full in his face—They must scourge most cruelly, brother—quoth he.—

Had a wasp come full speed against, and struck its sting into the right side of my father's nose—he could not more suddenly have jerked his head to the left—leaving my uncle Toby's eyes fixed on his profile.

My uncle looked alarmed—he thought my father had been seized with a paralytic stroke.

Gentle soul! little didst thou think that thou wert the bestower of it!

The wounds of my father soon healed;—they were healed by that delight which he took in convincing the mind of my uncle—or rather that pride which he took of throwing the daylight of his own mind into the windows of that of my uncle Toby—which, by the by, were

sometimes so be-dimmed, and sometimes so *be-curtained*—that the sun himself might as well have thrown his rays through a brick-wall—as my father have thrown his—through such barricadoes—into the arsenal of my uncle Toby's ideas.—My father's countenance brightened up, and he continued the delineation of his Prime Minister.

He should promote good institutions—said my father—and good institutions would rectify our follies and our errors.—Then, Toby, we should not see boxers and bruisers patronised by leather-fisted, and I may add, leather-headed lords—We should have no more bull-baits—nor bear-baits—nor badger-baits—nor cock-fights, Toby.—*We should not give cruelty where Nature has denied it.*—Our children—

I have none—quoth my uncle Toby, shaking his head.

That's more than I know—replied my father.—

Indeed, brother, I have none—legally or illegally begotten—said my uncle Toby.—

Then those who have—quoth my father, (testily)—would not see them practise cruelty to brutes, which grows up into cruelty to man;—the harmless fly might then take his perpendicular walk up the panes of our windows—without danger of being annihilated by the mischief of childhood:—Good institutions would rectify these things;—we should then, my dear Toby, be in the high road to become a civilized nation.

I thought, brother,—quoth my uncle Toby, with surprise—we were a civilized nation.

Pray, Toby—said my father—what is a civilized nation?

—Not a savage one—replied my uncle Toby.

'Tis very civil, (and in truth, Toby, very unlike a savage)—quoth my father—to deprive millions of men, who will not shed blood, of the produce of their own country—and so starve them;—'tis very refined, Toby, to attempt driving the real possessors of an island into the most barren parts of their own territories—in order to seize on the most fertile—because—the drivers were a *civilized* people, and happened to fancy themselves stronger—(which, by the by, they were not; for a *pin* of virtue has more power than a *sword* of vice, Toby.)

—Not in battle—quoth my uncle Toby—

It is merciful and civilized—because some of our relatives, (branches of the same tree)—scattered over a country far away from us—would not suffer their purses to be opened against their consent—that the *civilized* people should murder the rebels, and burn their habitations. It is the highest picture of civilization, Toby, to tear friends and relations—mothers and fathers—brothers, sisters—husbands and wives—from each other—and drag them from their country,—because *their noses are flat* and *their faces black*.—'Tis humane to lash them like obstinate beasts—in order to render them as civilized as their whippers.—It is liberal to burn the house of the *man of science*,—because the owner does not think corruption, soundness—and self-interest, generosity.—Isn't this civilization, Toby?

I thought, brother—quoth my uncle Toby—that these things were only practised in a savage state.

The *civilized savage*, Toby, is the worst of savages—replied my father.—*Anonymous Imitations of Sterne.*

THE following Fable is partly original, and partly not. The author has considerably altered it, so as scarcely to be recognized as the same; and he has very honourably apprised the Editor of the circumstance of its former publication.

REGENERATING FABLES.

NO. II.—THE INNKEEPER AND GUEST.

Ye priests, to you I dedicate my metre,
 Whatever be your pious leader's name;
 Whether 'tis Luther, Calvin, or St. Peter,
 In disposition you are just the same;
 For proud yourselves, you all would keep us humble,
 And with heaven's holy truth your falsehood jumble.
 In Ovid and in Plutarch we have read
 Of one Procrustes, famed for horrid whims,
 Who kept for travellers a certain bed,
 In which he stretch'd or lopp'd their tender limbs,
 Determined, or sage Plutarch tells us lies,
 That bed and body should be of one size.
 'Tis thus our understandings you would use,
 And alter their dimensions as you choose;
 But your opponent, Truth, is fast prevailing,
 And really, reverend sirs, your trade is failing.
 Now, you exclaim, with hypocritic whining,
 "Alas! we see religion fast declining;"
 When, by the merest idiot, it is seen
 That priestcraft all the time, is what you mean;
 And scoffing Common Sense undaunted says,
 "Religion flourishes as craft decays."
 What is religion?—'tis the tie which binds
 In bonds of love dis sever'd minds:
 And now, were they dis sever'd, human skill
 Cannot unfold the great EFFICIENT WILL.
 But this man knows; for every social bane
 He may on antidotes rely;
 "Both are before him;" why complain,
 And not the antidote apply?
 For social evils, what is then the cure?
 The principles of love—religion pure.
 And well the tyrant, well the priest must know,
 Pure gospel-truth shall prove their overthrow.
 If e'er Religion suffer'd degradation,
 It was to you she owed the obligation:
 She holds a cup with nectar flowing o'er;
 But in that cup you deadly drugs infuse,
 Or some benumbing opiate in it pour;
 And when you cannot *hocus*, you abuse.
 If to Religion you would wish success,
 In native purity let her appear;
 Make her not odious by an odious dress,
 And mankind then Religion will revere:
 But, as it is, with sicken'd soul they slight
 What, were it not for you, would gain delight.
 Now, lest such naked argument should fail
 To make it clearer, take the following tale—
 A tale, I know, unmerited by you,
 For, unlike some you tell us, it is *true*:—
 There lives, somewhere upon the great North-road,
 The miles from town I cannot mention;
 And, if I could, my verse I would not load
 With trash, so far beneath a bard's attention;
 Trifles, with which some people cram narrations,
 I leave as hooks for future annotations.
 Somewhere, I say then, on the great North-road,
 A publican hath his abode:
 Not one of those in Scripture join'd to sinners;
 One by whose aid the weary traveller sleeps,
 Who feeds the hungry, for he kindly keeps
 A shop for suppers and for dinners.
 All Englishmen some oddity can boast,
 Even from the "Old Red Lion" to the throne;
 And Peter Popjoy,—so they call mine host,—
 Has, like the rest, some whimsies of his own.

Oppose him in a favourite topic,
 And he will very soon a crow pick:
 But on all subjects, save on these,
 He is as pliant as you please,
 And, all who know him, witness can,
 An upright, downright, blunt, straight-forward man.
 It chanced one evening, in post-chaise and four,
 That Humphry Higgins stopt at Peter's door.
 Seldom, if ever, he was known to range
 Beyond the precincts of the Roy'l Exchange;
 And now, 'twas business made him fly,—
 No trifling business, you may swear;
 A rich old uncle was about to die,
 And Humphry strongly wish'd to be his heir.
 Prudence and wife said Go—who both would baulk?
 The stage was full—it was too far to walk.
 Like your poor bard on Pegasus astride,
 Who feels, somehow, he was not meant to ride,
 He liked not horsemanship, and often said
 He thought he was not for such *labour* made;
 In this dilemma, for the sake of speed,
 He took post-chaise—so let my tale proceed.
 See Higgins seated in the parlour waiting,
 His boots pull'd off, and slippers in their place;
 The various hazards of the day relating,
 With cheerful, self-congratulating face!
 You smile,—and I suppose you think him blest,
 But yet his happiness is not complete;
 For English happiness may be compress'd
 In two short words,—*videlicet*,—TO EAT.
 To eat they think their being's "end and aim,"
 And more they fight for pudding than for fame.
 To eat, they no remembrances will need;
 For 'tis a fact undoubted, let me tell ye,
 When Englishmen forget to cram their belly,
 It is a very deadly sign indeed.
 Humphry had no such sad prognostication,
 But acted as became the English nation.
 A Scotchman would have search'd his *pouch*,
 And weigh'd the matter well;
 But Higgins was an Englishman,
 And therefore—rang the bell.
 "Sir, did you ring?" quoth Peter, bowing low,
 For all his guests most humbly he would greet;
 "I did," quoth Humphry, "for I wish to know
 If you can give me any thing to eat."
 "Yes, that I can, Sir," Peter smiling said,
 And, like a lily drooping, bow'd his head:
 "Cold veal, cold ham, cold beef, cold giblet-pie"—
 "Alas! all cold?" quoth Higgins, with a sigh.
 "No! I can likewise suit you, Sir,
 If something warm you would prefer:
 Rump-steaks, when fried with onions, Sir, are nice,
 And you can have them in a trice."
 "Rump-steak!" cried Higgins, with joy-sparkling
 eye,
 'Tis just the very thing I wish;
 But if you do not wish to see me die,
 Put no vile onions in the dish."
 This speech did not at all with Peter suit;
 Onions he worshipp'd like an old Egyptian,
 And always would defend his favourite root;
 For Peter was not of a mean description.
 So thus he spoke: "Do me the favour
 To recollect their charming flavour"—
 "Charming! my friend, did'st say? I swear it—
 It is so charming, I could never bear it."
 "But with submission, Sir,—beg pardon—
 They are the best root in the garden."

"Perhaps to others they may be,
But they are poison, friend, to me."
"Try them for once, Sir, when well dress'd"—
"I tell you, onions I detest."
"But, Sir, another trial make,
I'm sure you'll like them—for my sake."
"You need no more your language waste,
For I will *not* your onions taste."
Here Peter bowing left the field
But not because he was defeated;
For Peter never yet would yield;
It was to vanquish, he retreated.
So straightway to the kitchen he repairs,
And tells the cook "to dress without delay,
For a *peculiar* gentleman up stairs,
Some steaks with onions in her *usual* way;
But strive to cook the matter so,
That he may not the onions know;
For if he does, so crazed the poor man's brain,
He swears he never shall be well again."

Were I as able a verse-stringer
As the Maonian ballad-singer,
I here an episode would make, ⁷
And sing the art of frying steak;
But I refer each lad and lass
Who wish in cooking to surpass,
To Homer or to mistress Glasse;
For I shall not my Muse degrade,
And make her turn a kitchen-maid;
For then my verse must be confess'd
To be but kitchen-stuff at best.
Far nobler subjects claim the poet's lay:—
The steak already smokes upon the table;
And Higgins, in a striking English way,
Prepares to eat as much as he is able.

But ah! how dreadful the decrees of fate!
How shall my Muse the dreadful tale relate?
Scarce two small mouthfuls he had masticated
Before his appetite had quite abated:
His taste, like every Englishman's, was quick,
And soon discover'd Peter's onion trick.
He rose—kick'd down the table—swore
He never once was so ill used before;
All his ideal plans of pleasure fled,
Was carried sick and supperless to bed;
And from that time, such was the onions' power,
Rump-steaks he has not tasted to this hour.

Here ends my tale. You yawn, and I suppose,
Most reverend sirs, you think it is fit time;
But, you should recollect, that sometimes prose
Makes people drowsy just as well as rhyme:
Witness examples out of number,
Where certain folk make certain people slumber.

Now, since my tale has found its termination,
With prick'd-up ears attend its application.
Know, then, in Peter is depicted *you*;
In injured Higgins, all mankind we view;
Steak is religion, Reason's choicest feast;
Onions, the loath'd ingredients of the priest;
Ingredients that, though well you know we hate,
You never cease to heap upon our plate;
Which makes us cry, in spite of angry looks,
"God sends us meat, but Satan sends us cooks."

Here once I thought my humble rhymes to close;
But, on deliberation, think it better
Before I end, a query to propose,
And fix, by way of postscript to this letter—

If you attentively have heard my song,
Doubtless you think that Peter acted wrong.
Then what, O reverend sages, would ye say,
Had he made Higgins, in a *legal* way,
Even for the hated onions *dearly* pay?

Oct. 30, 1834.

L. P. S.

HALLEY'S COMET.—This comet, which is expected about the end of next year, appeared in 1531, 1607, 1682, 1759, having a period of somewhere about 76 years, which is not so great as the period of the planet Uranus, whose time is about 83 years. The times of comets are very much affected by what are called planetary perturbations, which ought always to be taken into consideration in calculating their return. A little before the appearance of the comet of 1759, Clairaut determined the amount of these planetary perturbations to be so great as to cause the comet to exceed its reputed time by 618 days, and predicted its approach about the middle of April, 1759. It appeared on the 12th of March. But he had previously declared that he might have committed an error of a month. The appearance of the luminary was within the limits of the error he had supposed possible. No doubt all these circumstances are taken into consideration by the improved calculations of modern analysis, so that we may look with a considerable degree of certainty for the meteoric visitor. We were disappointed, however, in 1832, in one of these predictions. Of comets we know very little: it is most probable that they are highly electrified bodies, and may be instrumental in clearing the planetary sphere of its noxious properties, serving as a species of broom to the heavens, which, in figure they much resemble. There can be no doubt of their utility, whatsoever be the nature of it. Nature, however profuse in her productive powers, seems, notwithstanding, to do nothing in vain; every thing is useful in its place; and, what is more, every thing seems to be indispensable.

PREJUDICE.—"The servile flattery of the ancients," says a reverend divine (Faber on the Mysteries of the Cabiri), "translated the deified spirit of Cæsar into the Julium Sidus (or Julian Star); and a great astronomer of the present day, adopting the classical compliment without the classical impiety, has given the appellation of the Georgium Sidus (or George's Star) to the newly discovered planet."—We wonder how many hairbreadths of difference there are between the ancient classical impiety and the modern compliment. We strongly suspect that, when both are analysed, they will be found not only to contain the same ingredients, but to be identically the same.

NOTICE.

On Sunday evening, November 8, at seven o'clock, at 36, Castle-street East, Oxford-market, the Editor of the *Shepherd* will deliver a demonstrative Discourse on the First Principles of the Science of Nature, as applied to the doctrines and progress of the Church in all ages, until the reunion of its scattered members in one great family, temporal and spiritual. The illustrations will be given on the Demonstration-board, and any person may have an opportunity of putting questions, or demonstrating the fallacies of the Lecturer's positions, by the same mathematical process. No Parliamentary discussion.—Admittance 3d.

Printed and published by B. D. COUSINS, 18, Duke-street Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Tron-gate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Bready, Sheffield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 12.]

SATURDAY, NOVEMBER 15, 1834.

[Price 1d.]

SYSTEM OF NATURE.

"THE redemption of man" will now become a very simple subject to those of our readers who have followed us from the beginning; for it is evident that in the progress of society man must first fall and then rise again. His rising again is his redemption; but his redemption is synonymous with the death of one of the sons of God. God has two sons; evil and good. Which of these two sons is it that must die to save man? A child may answer that it is the evil.

But if the other should die, it makes matters worse; instead of bringing peace on earth, it brings confusion. To make the just die for the unjust, therefore, is to make the evil victorious; and it is one of the characteristic peculiarities of the evil that it murders the body, in order to cure bad morals. This is the first step in the progress of experience; but it proves ineffectual, and this important fact is taught in the living and affecting model of the death of Christ. The prophet foretold that when the Messiah *should die* he should make an end of sin, and bring in everlasting righteousness. Then the query is, has the Messiah yet died? Let the prevalence of sin and unrighteousness answer the question. The Messiah only dies when *evil dies*.

These two sons, or Messiahs, so frequently spoken of are also represented by matter and mind. The one, when corrupt, is destroyed by the spirit of law; the other, when corrupt, is reformed by the spirit of liberty. Hence, at the end of the law a living representative of God is destroyed in the body; but at the end of the gospel the corrupt *spirit* of political and ecclesiastical society is destroyed, that is, reformed. It is evident that this latter is the true sacrifice for sin, and the beginning of righteousness. The first of every thing fails, according to the science of Nature and the Scriptures; as St. Paul says, "He taketh away the first that he may establish the second."

The true Messiah, then, whose *death* avails us, is the spirit of the old world? Most assuredly it is the evil which dies, that the good may succeed. But how is it said that there is only one Messiah, and at the same time two? Because every man is a compound of good and evil. Evil first reigns until the good is fully developed, then the evil is destroyed; but still the man is the same individual. It is said of Christ that he had two natures, a corruptible and incorruptible; and that the one died that the other might be developed. Hence, the true Messiah is the spirit of the new world as well as of the old, for he is nothing else than a personification of God

or Nature in the two characters of evil and good; the old man and the new: "Put ye off the old man, who is corrupt after deceitful lusts, and put ye on the new man, who, after God, is created in righteousness and true holiness;" "*crucify* the old man, with his affections and lusts."

But the old man is twofold; he is a house divided; he is the two extremes in a state of opposition: law without liberty, and liberty without law; which are both tyranny. The new man is the union of both. Hence the new man is third in progress, and the law and gospel are Satan's divided kingdom.

But if Satan is not the true God, he apes him; there is the same resemblance between him and God as between the material and intellectual world; the one is a model of the other; hence the origin of types. All the old world is a type of the new. When Satan, then, had killed the material Messiah, or representative of God, it followed, of course, that a kind of sham millennium should be set up; it was so. The holy Mother Church is a perfect model of it; and from the year 533, when the pope was legally acknowledged by an imperial edict supreme bishop of the western empire of darkness, to the year 1533, when England, the great national representative of Protestantism, first officially, by royal authority, threw off her allegiance to the pope, is exactly a millennium, or one thousand years. But the first millennium, like the first of every other institution, is merely an imperfect model, full of errors, divisions, murders, and all other crimes, which are the unavoidable results of erroneous principles of science and morals. Hence, it goes by the name of the dark ages, or the reign of darkness—Satan in his glory: "He said in his heart I will ascend into heaven. I will exalt my throne above the stars of God. I will also sit upon the mount of the congregation in the sides of the north. I will ascend above the heights of the clouds. I will be like the Most High. Yet thou shalt be brought down to hell, to the sides of the pit. How art thou fallen from heaven, O Lucifer, son of the morning! how art thou cut down to the ground, thou that didst weaken the nations!"

Let us examine the model a little more minutely, for there can be no doubt that it is a prototype of a greater institution to come. In the first place, there was the spiritual Messiah at the head of it, with the divine cognomen of God upon earth, King of kings and Lord of lords. There were his spiritual or intellectual assessors, the cardinals, bishops, priests, monks, nuns, of every grade, "who neither married, nor were given in marriage; but were as the children of the resurrection, and

the angels of God." There was the glorious principle of the supremacy of the mind as beautifully illustrated as it possibly could be in an age of ignorance; for without a sword, and without a weapon of war, did these holy tyrants rule the nations, and subject them to their imperious nod; kings and emperors trembled in the presence of a shaven monk; the spiritual department ruled over the material. And ought it not to do so? Yes! and shall do so again, after a more excellent fashion.

It is folly for us to blame these men for what they did; they acted according to the spirit of the age in which they lived, which carries the individual along with it like a cork in the tide, so that resistance is vain. The human mind cannot put in exercise more knowledge than it possesses. The sciences were all at that time in their infancy; darkness brooded over the face of society; how then could religion be understood, which is nothing more than the science of sciences, or the "union" of all the sciences in one, as the very meaning of the word implies. But as the planetary system is an exact model of the seven colours of light which illuminate it, and as without this light radiating upon it, it remains in horrid darkness, notwithstanding its organic resemblance to light; so also this splendid catholic model of the universal kingdom, exactly as it resembles the great original even in its minutest parts, was still the reign of darkness and misery, for the light of truth had not shone upon it.

This splendid model of the kingdom of God was the *third* stage of the progress of Christianity. The first stage was that which preceded the political establishment of Christianity by Constantine, and lasted three hundred years, during which its doctrines were elaborated by its rapidly-increasing converts. The second stage was its political establishment, in subserviency to the state, and contending with the remnant of Paganism; this lasted two hundred years. The third stage was the papal millennium, of which we have spoken, when the spiritual department gained the ascendancy for which it had been striving so long. This completes the first great era of Christianity, consisting of fifteen centuries, fifteen being the Roman indiction, or cycle of years employed by the Romans in the calculation of time; and the Catholic church, which till then had been a growing progressive church, was now completely stagnated by the Council of Trent.

The Reformation, or fourth stage, begins the whole *de novo*, and in the first place rebels against the spiritual domination of the church, and gives the sceptre into the hands of the magistrate once more. It restores the doctrine of the divine right of kings, instead of the ecclesiastical doctrine of the divine right of bishops. It takes the church under its protection as a "*femme covert*," or married woman, makes a slave of it to serve its own ends, and restores the reign of materialism, or the sword. The church is now a wife, formerly it was a husband. It is now three hundred years since this stage began, and men have been elaborating the details of science as they formerly did of religion, making preparations for a general union of both. And now another stage has broken in upon us, the fifth or universal stage, the sovereignty of the people, which diffuses over all the population the

power and the influence which was formerly recognized in the few only. The first political step of this change was taken at the end of three hundred years exactly. The rest will follow in succession. In this stage the principles of universalism and unity will be established by the civilized or enlightened nations of Europe, &c., and the next will see them practically developed over all the world. Then shall the end be.

This analysis of the church, which every one must allow to be characterized by the utmost simplicity and truth, accurately corresponds with the progressive development of the five senses. First taste, the basest and most limited in its sphere of action—the smell, somewhat more refined and enlarged—then the eye, almost boundless in a direct line, but only embracing *one* hemisphere; selfish also and unintellectual, in so far as it is not the immediate organ of colloquial or social intercourse—then the ear, social and intellectual, embracing both hemispheres, inasmuch as we hear both behind and before, and the organ of social communication, by which we become acquainted with the experience of others, an organ of enquiry and criticism—then feeling, which comprehends all in a general union, making the eye, which without the use of language and the ear would never have communicated much minuteness and accuracy of information, the instrument by which we now acquire the greatest proportion of our knowledge, and giving the ear an opportunity of receiving the testimony of others by means of written language, without which the social intercourse of society could never have been accomplished.

We now enter, therefore, upon the era of union, which will soon become a password both in the political and ecclesiastical world. The word is at present a mere unmeaning sound in the ears of the people, but the light of science is radiating upon it.

THE SHEPHERD.

PHRENOLOGY.

THIS is a science of more rapid growth than any in the catalogue. It is a species of intellectual mushroom, or scarlet-bean, which rises with rapidity to its full growth; and it only remains to be seen whether or not this growth will as rapidly decay. It seems to be a law of nature, that those animals and plants which are speedily matured as speedily perish. The ephemeron is the insect of a day; and it is vulgarly reported of some smaller insects of well-known rapacity, that they are grandfathers in twenty-four hours. But how can a science die? Is not truth eternal? Certainly; but truth is not divided like our sciences. Truth is a unity, and has not made its appearance in the world yet. All the sciences must die individually, for they must all be united into one. "Whether there be prophecies, they shall fail; whether there be tongues, they shall cease; whether there be knowledge, it shall vanish away: for we know *in part*, and we prophesy *in part*; but when that which is perfect is come, then that which is *in part* shall be done away."

There is truth in phrenology, as well as in all other sciences. It is evident that there is a correspondence

between the intellectual faculties of the individual and the external formation of the brain. A very small brain, a "forehead villanous low," as Shakspeare expresses himself, is a sure symptom of some intellectual, and consequently moral, deficiency; whilst a brain well developed, full, broad, smooth, and round, is a pretty correct indication of good intellectual and moral character. This is a general truth, but a truth to which there are numerous exceptions, that throw very powerful obstacles in the way of the phrenologist when he attempts to establish his system of separate and independent organs.

It is a general truth that a man is strong or weak in body in proportion to the breadth of his chest and shoulders, the size of his bones, &c.; yet there are many exceptions to this undisputed fact; for there are many individuals of this happy constitution of body, who from an infinite variety of causes—nervous affections, collection of fat, and other enervating complaints—are reduced to a state of comparative debility, with all those fortunate circumstances in their favour. Analogy ought, therefore, to teach us that the formation of the skull is subject to the very same laws, and that symptoms of intellectual strength may appear even in the midst of intellectual weakness.

Analogy teaches right; these symptoms do appear; although the general proposition is still true, that a well-formed head is endued with good intellectual faculties.

The estimation of the intellectual power of a head by the size alone, is a very false mode of judging. We do not judge so of persons. Men are not strong and weak in proportion to their bodily magnitude, but in proportion to the firmness, consistency, and health of their frames; and we have no reason to suppose that any other law will prevail in the organization of the brain. The firmness, consistency, and health of the brain is therefore the principal and the best criterion of intellectual superiority.

But, say many of our phrenological novices, this firmness and health evinces itself by magnitude, or a large development of the skull which incloses the brain. This, however, remains to be proved, and the proof is extremely difficult; for it is well known to anatomists that those very portions of the brain which phrenologists have pointed out as the seat of particular organs, may be entirely destroyed, sliced off with a scalping knife, without any sensible injury to the intellectual faculties of the patient; the simple conclusion from which circumstance is, that the brain, or mind, is not that compound substance which phrenologists represent it.

But, again, the phrenologists observe that certain developments of brain are generally accompanied with corresponding developments of a particular faculty. We allow this to be correct, and, in general, we believe it to be so. What is the inference? That that faculty resides in that portion of the skull and in no other? We doubt the accuracy of this reasoning. We have similar indications of mental qualities in the face—such as a generous and affable disposition, expressed in the well-known but indescribable smile of the lips, movement of the nostrils, eyes, eyebrows, &c.; but we never imagine that affability and generosity are generated by the lips, eyebrows, &c., but that the disposition employs these parts of the

countenance as organs of expression, whilst at the same time it enjoys a separate and independent existence in the mind. But where that mind is we cannot tell; it is not in the nose, for the nose may be cut off, and the mind remain; and yet it is in the nose, when the nose is on the face, as you may easily perceive by the nostrils of a vain person when highly excited by some occurrence which particularly flatters his vanity. How his nostrils dilate! the wings are in a state of violent excitement, and the whole proboscis becomes unusually large. You might argue from this circumstance that vanity dwells in the nose. But it is a gross mistake; it only produces a muscular movement in the nose, when the nose is there.

What is now called phrenology is only part of a science—not a whole science. It is a branch of physiology, and requires for its perfection the additional consideration of many more particulars than the mere shape and size of the skull.

There are many other causes which have a powerful effect upon the intellectual system, besides mere development of brain. There is the nervous system of the whole body, which has its origin partly in the brain, and partly in the spinal chord. Nine pair of nerves proceed from the brain, and thirty from the spinal marrow. These nerves are evidently connected with mind. Hence, it follows that the mental development must partly depend upon the spinal chord as well as on the brain.

There are two species of nerves proceeding from the spinal chord; one set of which proceeds from the anterior division, and another from the posterior; the one is connected with volition, the other with sensation; for if you cut the one, the power of the will is destroyed in those parts where they circulate; and if you cut the other, sensation is destroyed. Will is an intellectual faculty; and this fact demonstrates its immediate connexion with the spinal chord as a source. But the spinal chord is connected with the brain? True; but there are portions of the brain which are much less indispensable to the mind than these parts of the spine, for there are entire phrenological organs which may be sliced off without much damage; but who can snap the spinal chord without destroying the whole man?

As the anterior nerves of the spine are connected with volition, and the posterior with sense, so it is with the anterior and posterior lobes of the brain—the cerebrum and cerebellum, or large and small brain. These two brains are quite distinct, and the spinal chord comes up between them, and thus forms a connecting link with a little middle brain, called the medulla oblongata, or marrow prolonged. The brain is thus threefold; two lobes, representing the material and spiritual, and a conductor connected with both, conveying their influence to the rest of the body, in perfect accordance with all the other triune combinations of Nature.

All these have a centre of union, which is generally called the sensorium or mind; but where or what that is we cannot tell. It is not the material of the brain itself, that is evident; but the material is necessary to institute a correspondence between the mind and the material world without, and mechanical action is necessary to keep up that correspondence.

Phrenologists, like astrologers, have already begun to make a trade of their science before it is complete, and they charge pretty smartly for the information they give. We have tried both frequently, and we have hitherto invariably found that the astrologer knows fully as much as the phrenologist, although he has all the prejudices of modern science to contend with.

We should like well to see the following experiment tried, and we would make it ourselves immediately if we had the means.

Take a model of the heads of ten different individuals to a clever phrenologist; and the correct nativity, place of birth, &c., of the same individuals to a clever and *scientific* astrologer; and then compare the result of their observations upon character, profession, habits, &c. We should not hesitate to bet one sovereign at least, that the astrologer reveals as much, if not more truth, than the phrenologist.

EXTRACT FROM

THE BOOK OF BENJAMIN THE SCRIBE.

1. And it came to pass, in the reign of William, that there was a great cry in the land; and the people said unto the king and to the nobles, Give us bread to eat.

2. And the nobles and the king consulted together and said, The people are exceeding clamorous, and their wrath is kindled against us. What shall be done—for our lives and our wealth are in danger?

3. And one answered after this manner, and another answered after that.

4. And one of the king's councillors answered and said, May it please my lord the king! we are in great trouble on account of this outcry—for my lord the king knows that we and he are dependent upon the people for support; and that it is impossible to satisfy the people without making a sacrifice of our own wealth, and our dominion over them. Shall we sacrifice ourselves that the people may be satisfied?

5. And all the nobles answered and said, God forbid!—to your tents, O Israel! Every noble for himself, and the people for themselves.

6. Then the friends of the people came into the council-chamber, and presented themselves before the king, and bowed before him, and said God save our lord the king!

7. And all the nobles answered and said, Amen!

8. And the chief speaker said unto the king, May it please my lord the king! the burdens of thy people are great, and too grievous to be borne; the tribute is sore upon the land; our bread, our water, our clothing, our lodging, every thing we need, and every thing we enjoy, is cursed with the mark which thy servants have put upon it.

9. Why should my lord the king put a tax upon the bread which supports the poor of thy people? Why should he begrudge the food which nourishes, the clothing which protects, and the homes which shelter us? Is there not enough in the hands of the princes and nobles of the land to provide for the exigencies of my lord the king?

10. At these words the king looked unto the nobles, but spake not; and the nobles looked at one another, and rowned.

11. Moreover the chief speaker of the people said unto the king, May it please my lord the king to cause a proclamation to be made throughout the land, requiring every man to render an account of his wealth, and the manner in which he has acquired it. Whether he has acquired it by the labour of his own hands, or by a tribute upon the labour of others; or whether it has come to him by hereditary succession, without any labour, skill, or contrivance of his own. After that, may it please my lord the king to make a decree that none shall pay tribute but those who receive tribute from others; that the poor man who possesses nothing but what his own labour has gained, shall be free from all impost and tribute whatsoever; and that those only who live upon the labour of others do contribute to the king's treasury. So shall the king find favour in the eyes of the people, and the people shall protect him in the day of trouble.

12. And the king seemed pleased with the saying; and he looked unto the nobles, but spake not, for the nobles were angry as they talked with one another.

13. Then one of the chief priests rose up from among the nobles, and said, This man is a traitor to God and to the king; for it is written, Render ye tribute to whom tribute is due; and all tribute is due to the king; and this was written not for the rich, but for the poor, for the gospel is preached to the poor. Wherefore, then, would the king provoke the Lord to anger by listening to the counsel of this people, who are a stiff-necked and a crooked generation. Let us obey God rather than man.

14. And as he said so he clasped his hands, and looked up unto heaven, and muttered with his lips; then he bowed his head, and looked downwards to the ground.

15. And the nobles did so likewise.

16. And the king was confounded and answered not, for he was afraid of the people and the nobles.

17. But the nobles insisted that he should dismiss the people; so he waved his hand for the messengers of the people to withdraw. But as they began to move, behold Enoch the prophet pressed through the crowd, and suddenly presented himself before the king. He was all covered with dust, and the sweat was streaming down his forehead.

18. And Enoch looked upon the king, and the nobles, and the chief priests; and Enoch said with a loud voice, Hear the word of the Lord!

19. And the king was afraid.

20. And the nobles were filled with indignation.

21. And the chief priests gnashed their teeth with rage.

22. Then Enoch answered and said, Hear the word of the Lord, ye rulers of Sodom; give ear unto the law of our God, ye princes of Gomorrah! To what purpose is the multitude of your prayers unto me? saith the Lord; I am full of the praises and the flattery of priests, and their profession of faith is a stink in my nostrils; they are as the blood of rams and of bullocks before me; they are a trouble unto me; I am weary to bear them.

23. Wash you; make you clean; put away the evil of your doings from before mine eyes; cease to do evil; learn to do well; seek judgment; relieve the oppressed; judge for the fatherless; plead for the widow; then shall

ye eat the good of the land ; but if ye refuse and rebel, ye shall be devoured, for the mouth of the Lord hath spoken it.

24. How is the faithful city become an harlot? her silver is become dross; her wine mixed with water; her princes are rebellious, and companions of thieves; every one loveth gifts, and followeth after rewards; they judge not the fatherless, neither doth the cry of the widow come unto them. Her judges judge for reward; the priests teach for hire; and the prophets divine for money: yet will they lean upon the Lord, and say, Is not the Lord among us? none evil can happen unto us. Therefore, thus saith the Lord, I will ease me of mine adversaries, and avenge me of mine enemies; and I will turn mine hand upon thee, and purely purge away thy dross, and take away thy sins.

25. In that day shall the branch of the Lord be beautiful and glorious, and the fruit of the earth shall be excellent and comely for them that escape from judgment;

26. When the Lord shall have washed away the filth of Zion, and shall have purged the blood of Britannia from the midst thereof, by the spirit of judgment and the spirit of burning.

27. And there shall come forth a rod out of the stem of Jesu, and a branch shall grow out of his roots.

28. And the spirit of the Lord shall rest upon him; the spirit of wisdom and understanding; the spirit of knowledge and of the fear of the Lord;

29. And shall make him of quick understanding in the fear of the Lord; and he shall not judge after the sight of his eyes, neither reprove after the hearing of his ears.

30. But with righteousness shall he judge the poor, and reprove with equity for the meek of the earth; and he shall smite the earth with the rod of his mouth, and with the breath of his lips shall he slay the wicked;

31. And righteousness shall be the girdle of his loins, and faithfulness the girdle of his reins.

32. The wolf also shall dwell with the lamb, and the leopard lie down with the kid; and the calf, and the young lion, and the fating together, and a little child shall lead them;

33. And the cow and the bear shall feed; their young ones shall lie down together; and the lion shall eat straw like the ox;

34. And the sucking child shall play on the hole of the asp, and the weaned child shall put his hand on the cockatrice' den.

35. They shall not hurt nor destroy in all my holy mountain; for the earth shall be full of the knowledge of the Lord as the waters cover the sea.

36. And in that day there shall be a root of Jesu, who shall stand for an ensign of the people, and to him shall the Gentiles seek, and his rest shall be glorious.

37. And when Enoch had uttered these words, he turned round, and departed from the presence of the king.

38. And the nobles, and the chief priests, and the messengers of the people, each returned to his own home.

39. And the king was exceeding thoughtful; but he spake not, wondering in his own mind what might be the end of these things.

PERFECTION OF THE SENSES IN SAVAGES.

THE dark-coloured races exhibit in general a great acuteness of the external senses, which is in some instances heightened by exercise to a degree almost incredible. In the unsettled life of wandering tribes, the chief occupations are hunting, war, and plunder. The members of the community are trained from their earliest infancy to these pursuits; and their progress in the necessary accomplishments determines not only the degree of their own personal enjoyment and security, but also their influence over others, and their rank in the association. The astonishing perfection of their sight, hearing, and smelling, must be referred, I apprehend, to the constant exercise of the organs; as their capability of enduring violent or continued exertion, in performing long journeys, is the simple result of habit. Both are very interesting in a physiological view; and acquaint us with the extent of our powers, which are very imperfectly developed in the members of civilized societies.

Mr. Collins has mentioned the quick-sightedness of the New-Hollanders; and another traveller has borne testimony to the same effect. "The quickness of their eye and ear is equally singular: they can hear and distinguish objects which would totally escape a European. This circumstance renders them very acceptable guides to our sportsmen in the woods, as they never fail to point out the game before any European can discover it."

In describing a New-Zealander, who accompanied him to England, Mr. Savage says, "It was worthy of remark how much his sight and hearing were superior to other persons on board the ship: the sound of a distant gun was distinctly heard, or a strange sail readily discernible, by Moyhanger, when no other man on board could hear or perceive them."

We learn from Mr. Barrow, that the Hottentots, "by the quickness of their eye, will discover deer and other sorts of game when very far distant; and they are equally expert in watching a bee to its nest. They no sooner hear the humming of the insect, than they squat themselves on the ground, and having caught it with the eye, follow it to an incredible distance."

He relates the following anecdote of one whom he had left behind ill on a journey:—"He had fallen asleep about the middle of the preceding day, and had not awakened till night. Though very dark, and unacquainted with a single step of our route, he had found us by following the track of the waggon. At this sort of business a Hottentot is uncommonly clever. There is not an animal among the numbers that range the wilds of Africa, if he be at all acquainted with it, the print of whose foot he cannot distinguish." "The print of any of his companions' feet he would single out among a thousand."

Dr. Somerville confirms this statement, and refers the superiority of the Hottentots in these points to constant exercise of the organs.

In his frequent intercourse with the Nomadic tribes of Asia, Pallas had the best opportunities of observing their capabilities. "The Calmucks," he says, "have a fine nose, a good ear, and an extremely acute eye. On their journeys and military expeditions, they often smell

out a fire or a camp, and thus procure quarters for the night, or obtain booty. Many of them can distinguish, by smelling at the hole of a fox or other animal, whether the creature be there or not. By lying flat, and putting their ear to the ground, they can catch at a great distance the noise of horses, of a flock, or of a single strayed animal. But nothing is so surprising as the perfection of their eyes, and the extraordinary distance at which they often perceive, from inconsiderable heights, small objects, such as the rising dust caused by cattle or horsemen, more particularly as the undulation of the boundless steppes or plains, and the vapours which rise from and float upon them in warm weather, render things very obscure. In the expedition which the Torgot Vicechan Ubaschi led against the Kubanians, the Calmuck force would certainly have missed the enemy, if a common Calmuck had not perceived, at the estimated distance of thirty versts, the smoke and dust of the hostile army, and pointed it out to other equally experienced eyes, when the commander, Colonel Kischinskoi, could discern nothing with a good glass. They pursue lost or stolen cattle or game by the track for miles over deserts. Kirgises, or even Russians, in the wild parts of the empire, are equally able to follow and discriminate tracks by the eye. This, indeed, is not difficult on soft ground, or over snow; but it requires great practice and skill to choose the right out of several intermingled traces, to follow it over loose sand or snow, not to lose it in marshes or deep grass, but rather to judge from the direction of the grass, or from the depth of the print in snow or sand, how long it has been made."

Representations equally surprising of the perfection of the senses are confirmed to us by the most unexceptionable authorities in the case of the North-American savages, and of other wild races.—*Lawrence's Physiology.*

ORIENTAL MYTHOLOGY.

(Concluded from No. 1.)

THOUGH the Hindoos maintain the division of the people into four ranks, or castes, yet the same division appears to have existed in other nations of Asia in ancient times, and also in Greece and Egypt; and Miller maintains, that the Saxons were classed as clergy, soldiery, husbandmen, and artificers. All these seem akin to that which we observe in bee-hives and ant-hills. The Hindoos call their castes—1. Scripture; 2. Protection; 3. Wealth; 4. Labour; proceeding from the mouth, the arm, the thigh, and the foot of the Creator. The Brahmin, or priest, is the chief of all creatures; while kings, and exalted men, are infinitely inferior to the lowest of the Brahmins. The three last created to serve Brahmins.

The Indian Brahmins neither eat nor kill any sort of animals; and it is certain, they have not done it for more than 2000 years. The forbearance leads to much practical benevolence, to abhorrence of all bloodshed, and to universal charity.

A Pagoda is a Brahminical temple, built very massively and elevated, but very small in the interior. Near the door of each is a post for beheading victims.

The Festival of Jaggernaut, in July, is attended by 2 or 300,000 devotees. The image god, and his brother and sister image, are drawn in cars to the Gondicha Nour

temple; and, as evidence of their faith, many devote themselves under the wheels!

It is estimated that there are two millions of Mahomedan and Brahmin Fakeers in India, fanatics, who, like the Christian anchorites, practise self-martyrdom in a thousand absurd austerities and disgusting tortures.

The Fakeers, or Yogees, of the Senese tribe, are a sort of mendicant philosophers, who travel all over Hindostan, and live on the charity of the other castes of Hindoos. They are generally entirely naked, most of them robust handsome men. They admit proselytes from other tribes, especially youths of bright parts, and take great pains to instruct them in their mysteries. These gymnosophists often unite in large armed bodies, and perform pilgrimages to the sacred rivers, and celebrated temples; but they are more like an army marching through a province, than an assembly of saints in procession to a temple: and often lay the countries through which they pass under contribution.

The most wretched class of human beings are the Pariahs (or Hindoos, who, from any cause, have been expelled their caste). Their religious impressions continue without its hopes and advantages, and no other Gentoo will hold the most distant intercourse with them.

In Bengal only, about 700 females have been burnt every year at the funeral piles, or Suttees, of their husbands.

Members of the Hindoo castes may obtain their living in lower castes, but they may not ascend to higher. A Brahmin may be a soldier, a husbandman, or a merchant, but neither of these can be a Brahmin.

Jumnotree, in the wildest part of the elevated Himalayas, has a temple visited by distant devotees, sacred to the goddess Jumna. Beunderpouch, near it, is 25,000 feet high.

Gangotree, the source of the Ganges (the holy of holies), is a small temple to the goddess Gunga, in the most surprising spot on the globe, and shut in by snowy peaks and falling rocks, inspiring awe and terror. The summit of this holy mountain has five peaks, called Roodroo-Himala, the residence of Mahadeo himself.

Suicide is common, and often considered meritorious, among the Hindoos.

The Burmans, who are Buddhists, adopt, as their presiding deity, Godama. They state that they received this religion from Ceylon; and it is now adopted generally in India, beyond the Ganges. They describe Godama as the last of four gods, who have lived in the flesh upon the earth before they obtained a perfect state. Godama, at thirty-five, obtained divinity and preached the law for forty-five years, which secured salvation to all living things. At eighty he commanded his law to be observed by his disciples for 5000 years, and that his images and relics should be worshipped. His law consists of five commandments and ten sins. The commandments are, not to kill any thing; not to steal; not to commit adultery; not to speak falsehoods; not to drink any thing intoxicating. The ten sins are, killing animals, theft, adultery, falsehood, discord, severe language, idle talk, covetousness, envy and malice, false gods. To perform the one, and abstain from the other, secure exemption from decay, old age, disease, and death; besides the privilege of seeing the other gods who are to follow Godama. The other good works are, giving alms, and frequently pronouncing, with solemnity, three words, to remind the party of vicissitudes, misfortune, and fate. Godama, they say, departed 2790 years ago. The temples of Godama are of a pyramidal form, some of them 300 feet high, and often gilt over. Godama is repre-

sented as a young man of mild countenance, commonly sitting cross-legged upon a throne, with a book in his left hand, and often of colossal size.

The inhabitants of the Nicobar islands, in the Bay of Bengal, and of some others in those seas, keep a festival at every change of the moon, by which they establish, by lunar motion, a seventh-day holiday, and an eighth day every fourth time.

Baptism, by immersion in water, is of Hindoo origin, and was spread by them through Asia. The prophets purified the Jews by baptism.

The Hindoos have no less than nine sects of philosophers, whose principles embrace all the metaphysics and speculations of the Greeks, and the objects of controversy among modern Europeans. Three of them are atheistic, and six are partly materialists, and partly spiritualists in certain shades of difference. No justice is done to their profundity in the crude or partizan reports of Europeans. Their *Vedas*, or ancient books of ceremonials and morals, are probably the foundations of Egyptian and Hebrew knowledge; for example, they contain the cosmogony copied by Moses, or by the authors of the Pentateuch; and the entire Book of Leviticus is in them almost word for word; also the entire passage about the Word, &c., with which the Gospel ascribed to John is commenced.—*Wilford*.

In the centre of Ceylon is a mountain, Hamallel, like a sugar-loaf, and on the top is the print of Buddha's foot, when he ascended into heaven, about 900 B. C. The area of the summit is seventy-two feet by fifty-four, and the pretended impression of the foot in the rock is covered by a wooden building, enclosed by a frame of copper, ornamented with precious stones. It is hourly visited by pilgrims from all parts of India.

The natives of Japan, from religious motives, abstain from all flesh meat; but eat the sub-marine plants of almost every kind, as the greatest dainties. For these the fishermen (the best divers of the country) will dive even thirty fathoms. When washed and sorted, these marine plants are regularly exposed for sale in the markets.

In China, &c., the priests, not Hindoos or Mahomedans, are called Bonzes; their god, Fo; and their temples, pagodas. In Tartary, the priests are called lamas; and in China, Ho-Changa. Their endowments are splendid, and they worship the same divinity, under the forms of various animals, which they allege the soul of Fo has occupied. They are sorcerers and dealers in charms, and have obtained as complete an ascendancy over the minds of the vulgar and women, as the priests of any country; and, in many cases, they prove their own sincerity by imposing on themselves the most frightful punishments. One was seen in a narrow cell, stuck full of nails; others are seen with burning coals on the tops of their heads; others with massive chains fastened to their legs and bodies: all which penances they perform as an atonement to God for the sins of the people. The women are their chief adherents, and the ladies form societies under their direction, called religious; but the mandarins and merchants in general laugh at their impostures.

Fo, the Chinese divinity, or incarnate god, lived about 1100 B. C. At nineteen, he abandoned his family; at thirty, he began to work miracles; and, at seventy-nine, his incarnation ceased. His followers teach that he pre-existed, and had appeared eight thousand times in different forms of transmigration. He taught that nothing is the beginning and end of all things; and that the happiness of man consists in doing nothing, willing

nothing, feeling nothing, desiring nothing, and taking no thought for the future. His disciples teach that he came on earth to expiate men's sins, and his four precepts are, to kill no living creature, to take nothing that belongs to another, to utter no falsehood, and drink no wine.

The Chinese have several great festivals; the religion of the people is divided into many sects; but, in the temple devoted to heaven, in Pekin, called Tien-tan, the emperor sacrifices animals at the winter solstice; and, at the temple of Tee-tan, he sacrifices to the earth at the summer solstice; again, at the temple of Ge-tan, or of the Sun, sacrifice is performed at the vernal equinox; and, at the temple of U-tan, or the Moon, sacrifice is performed at the autumnal equinox. At the vernal equinox he holds a plough, and sows the first seed which is sown in the empire; and a cow is sacrificed in the Tee-tan, or Temple of the Earth. The feast of the new year and of the first full moon of the year, and some others, are held as days of festivity, for no Sabbath is kept in China. The Jews, in China, are the principal silk manufacturers, and they settled about 250 B. C.

So late as 1814, the Emperor Kia-king published, in the *Pekin Gazette*, that a rebellion had been crushed, owing to the image of the god Kevanté having appeared in the air during the contest; and that an assault on a city was repulsed, owing to a spontaneous flame arising from the Temple of Kevanté.

Patience, obedience, gravity, and taciturnity, are the cardinal virtues of Confucius, or Chee-Koong. His works are, the *Ou-king*, in five books, and the *Se-shoo*, in four books. Marshman and Morrison have translated them, but they contain far more chaff than wheat, though highly curious as productions of 2630 B. C. in the reign of Hoang-tee. So say all his biographers and the Jesuit missionaries.—*Million of Facts*.

TITHES, &c.

For the first 800 years of the Christian era, tithes were given as alms. We are informed by St. Jerome, Bernard, Chrysostome, Wickliffe, Huss, and many other ancient historians, who uniformly agree, that tithes were purely voluntary. St. Augustine says, "If we (the priests) do possess any thing privately which doth suffice us, the tithes, or alms, are not ours, but the gods of the poor, whose stewards we are; except we do challenge to ourselves a property by some damnable usurpation." And Eusebius says "If thou dost possess any thing more than extreme necessity doth require, and do not help the needy, thou art a thief and a robber." And in Burns's Ecclesiastical Law is the following:—About the year 791, Offa, King of Mercia, (the most potent of all the Saxon kings of his time in this island,) made a law, whereby he gave unto the church the tithes of all his kingdom; which was done to expiate for the death of Ethelbert, King of the East Angles, whom, in the year preceding, he had caused to be basely murdered."

Clerical benefices originated in the twelfth century. Till then, the priesthood were supported by alms and oblations at mass. The term *Benefice* was originally applied as a reward to soldiers. The mendicant friars refused the oblations.

The tithes, &c., of England and Wales are estimated at 8,896,000*l.*, or equal to about one-third of the land rental of the kingdom; for they are one-tenth of the produce, and of all capital, labour, and improvements expended on increasing the produce. The clergy of all Christian Europe, with seventeen times the population, receive, it is said, about 8,842,000*l.*; while the Dis-

senters, who are half the religious population of England, sustain their establishments with half a million. The tithes were granted by Offa, in 794, for the bishop, the church, the poor, and the resident priest, in consequence of its being announced by the clergy that infernal "spirits ate all the grain in the ears, and that, to keep them off, it was necessary to devote a portion of the crops to religion and charity."

Others say, that tithes on all the land in England were granted to the clergy, in 855, by Ethelwolf, on his return from a pilgrimage to Rome.

As an equivalent for all the tithe on the produce, some clerical writers claim one-third of all the rentals, leaving the poor, the church-rates, &c., to be paid out of the two-thirds and the produce.

Presbyterians maintain, that the government of Christian churches is in the ministers and presbyters, or elders.

Rectors enjoy both great and small tithes, but vicars enjoy only the small tithes, with part of the glebe. Vicarages were rectories craftily appropriated by monasteries, who sent a monk to act as their vicar, taking the great tithes for the monastery. At the reformation, when Henry the Eighth suppressed the monasteries, their incomes from great tithes were seized upon by courtiers; and these persons and their successors, by inheritance or purchase, constitute the 7597 lay improPRIATORS, who make a traffic of these ecclesiastical concerns.

The first-fruits, or profits of every spiritual living, for one year, above 50*l.* and the tenths, are applied to the augmentation of poor livings, of which there were, when the plan was adopted in the reign of Anne, 5597, or one-half, averaged at 23*l.*

In the Church of England there are 755 cathedral dignitaries; 10,872 church livings, of which only 63 are in the gift of the inhabitants, 1,014 being in the crown, 3,769 in the church, 794 in the universities, 5,030 in the nobility and gentry, and 197 in various public bodies.

The Dissenting Congregation in England and Wales, in 1829, were 7,904, of which 2,827 were Wesleyan Methodists, 1,663 Independents, and 258 Presbyterian, (the two last including one-third Unitarian,) 1,047 Baptist, 396 Friends, 1,084 other Methodists, 241 of other denominations, and 389 Catholic.—*Sir R. Phillips.*

COMETS.—Herschel and Struve saw a star through the nebulous heads of the comets in 1795 and 1828. It is now asserted that the luminous envelope of the comet of 1811 was 26,000 miles in diameter, and its interior surface 30,000 miles from the centre of the nucleus. Its solid nucleus was 2,600 miles in diameter. But the nucleuses of four other comets were only from 30 to 400 miles; if, in fact, they are more than centres of nebulous matter. The comet of 1744 was visible in the day, and ancient authors assert the same of former comets. It had six tails, each 4° wide, and 39 to 40 long. The tail of the comet of 1680 was 82 millions of miles long. That of 1689, 63 degrees; of 1744, 8 millions of miles; of 1769, 40 millions of miles; of 1811, 23 degrees.—*Arago.*

TASTE.—The following simple experiment of Volta suggests some important ideas respecting the sense of taste:—Take a basin of zinc full of water, and place it on a silver stand, and it will be found that the water will have no particular taste when sipped up without applying the lips to the vessel; but if the vessel touch the lips, the water will have a peculiarly acid taste. This taste does not belong to the metal, but is an electric or galvanic effect,

produced by the two metals and the liquid. Upon the same principle, we account for the superior flavour of ale and porter when drunk from a pewter vessel; the effect is not produced unless the lips touch both the metal and the liquor at the same time—for these three make a galvanic circle, which always consists of *three* elements, one of which must be a liquid, the other a solid, and the third either a solid or a liquid. The positive electricity gives an acid taste,—the negative, an alkaline.

INTERESTING PHYSIOLOGICAL CASE.—There is at present in the Liverpool Ophthalmic Infirmary, under Mr. Neill's care, a case of very great interest. The patient is a little girl who was blind. About three years ago Mr. Neill operated on the right eye; the operation was successful, and she obtained sight. She was then in her eighth year. On Saturday last, the 4th instant, Mr. Neill operated on the left eye, in Slater-street Institution, with a similar happy result. This little creature, born blind, and for eight years in darkness, is now in full possession of the most precious sense; she can distinguish colours and the smallest objects. Her knowledge of distance, after the first operation, was for a long time imperfect. The first object that was presented to the notice of the eye was a halfpenny. For weeks afterwards every circular object, no matter how large, or of what colour, was called a halfpenny. Her residence was in Dove-court, School-lane, and, when blind, every nook and corner in the neighbourhood was familiar to her. When she obtained sight she often used to lose her way, sometimes even close to her own door. The instant this would occur she would shut her eyes, and feel around until some known object was touched. Then, with her eyes closed, she would hurry home, guided by her accustomed sense of touch.—*Liverpool paper of Oct. 1834.*

GEOLOGICAL.—Lieutenant Kotzebue discovered in the western part of the gulf to the North of Behrings Straits, a mountain covered with verdure, moss, and grass, composed interiorly of ice. On arriving at the place where the shore rises almost perpendicularly from the sea, to the height of 100 feet, and continues afterwards to extend with a gradual inclination, he observed masses of the purest ice 100 feet high, preserved under the above vegetable carpet. The portion exposed to the sun was melting and sending much water into the sea. An undoubted proof of the ice being primitive, that is, not formed by any causes now in action, was afforded by the great number of bones and teeth of mammoths, which make their appearance when it is melted. The soil of these mountains, which to a certain height are covered with an abundant herbage, is only half a foot thick. It is composed of a mixture of clay, earth, sand, and mould. The ice melts gradually beneath it, the carpet falls downward, and continues to thrive. The latitude is 66° 15' N.—*Gilbert's Annalen, 1821.*

NOTICE.

To-morrow Evening, Sunday 16th, Mr. Smith will deliver another demonstrative discourse at 36, Castle-street East, Oxford-market, in which he will give a further development of the first principles of the New Science of the Harmony of Nature.—Admittance threepence.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Brady, Sheffield; Tiaker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 13.]

SATURDAY, NOVEMBER 22, 1834.

[Price 1d.]

SYSTEM OF NATURE.

CHRISTIANITY was first preached by St. Peter, of whom his Master said "Upon this rock I will build my church, and the gates of hell shall not prevail against it;" and Constantinople was the first Christian capital, consecrated by Constantine about 333 A. C. Soon after this the Empire was divided into two, the Eastern and Western; and the Church was rent in a similar manner, and these two divisions are still known by the name of the Greek and Roman Church, the former prevailing in the East, the latter in the West. At last Protestantism made its appearance, and this completed the triune character of the imperial church establishment. This advanced still more westerly, the course pursued being exactly that of the sun in the heavens. From east to west then is the line of progress.

This splendid triune religious establishment now stands in a very precarious situation. Time will very soon reveal its fate; but that, according to the strict analogy of nature, we can easily predict, namely, death and resurrection. Christ died a corruptible body—he rose an incorruptible body. This also is the fate of his church.

But let us see what that church was. Was it original in the common sense of the word? that is to say, did it contain doctrines or precepts which were not in accordance with any thing taught in the world before? By no means. This is not the work of a Messiah; his work is to gather the scattered fragments of doctrine together, and make a new combination of that which nature has already brought forth. Christianity was a nucleus, or centre of union, for all the religious and metaphysical theories of the age, and in a very short time it embraced and appropriated them all. The peculiar tenets of Christianity were taught more or less by all the philosophic and religious sects of that age. The trinity, unity, original sin, redemption, resurrection, immortality, baptism, &c.; all these were taught and practised, in some way or another, in several parts of the world, before the appearance of Christ, so much so that many of the early Fathers regarded the Platonists, who held the doctrine of the trinity and other Christian doctrines, as real Christians.

The heathen nations were also familiar with the idea of the God-man, and the Son of God: their sacred canon was full of such characters. Apis, Osiris, Hercules, Bacchus, Esculapius, Chrissa, &c., are well-known deities, whose attributes in many respects resemble the character and office of the Son of Mary; and it was to

be expected, in the order of nature, that one at last should make his appearance, who should unite the pretensions of all these demigods in one, and unfurl the standard of nominal union for all conflicting sects. But real union could not be accomplished, for SCIENCE was not yet brought forth. And pray, what nation, what religion, could be more appropriate, according to the harmony of nature, for giving birth to such an individual, than that very nation, that very religion, which of all others in the civilized world taught the UNITY of God? The Gentile nations were nominally and professedly polytheists; Judaism alone was entitled to the honour of teaching and accomplishing the first species of union.

In those days mysticism was the only species of philosophy which existed. Men of genius employed their faculties merely in devising theories, for they had it not in their power to collect such materials for thinking as are now familiar to the most uneducated of the moderns. These theories divided the Greeks and Romans into a great variety of sects, the most mystical and religious of which were the Platonists, whose founder, Plato, had himself been a sort of unionist, inasmuch as he united all the preceding sects within his own—the physics of the Pythagoreans, the astronomy of the Ionians, the morality of Socrates, and the logic of the Eleatics. His disciples very readily embraced the Christian religion, for they found it correspond with all the fundamental principles of their own philosophy; and the Platonic Christians became the most zealous and renowned of the early Fathers of the church. Thus Christianity was so far suited to the spirit of the times as to embrace the most popular philosophy of the day. Nor is it possible to conceive how any better doctrine than that of the Jewish Messiah could have been promulgated in an age of scientific ignorance. His religion called into exercise the reasoning faculties of mankind upon abstract and metaphysical subjects, the analysis of which is not only indispensable to the cultivation of the human mind, but even to the perfection of language, by which social intercourse is conducted and knowledge put in circulation; and if it has also created an infinity of evil, that evil was unavoidable, and has brought with it the useful lesson by which future generations shall profit, that true philosophy must lay its foundations on the sensible or material world, and rise from thence to the spiritual or intellectual; instead of laying its foundation in the latter, and ascending to the former. The first Christian church began with the spirit and ended with the flesh; now we must reverse the order: true spiritualism rises from materialism.

Christianity was a stage in the progress of intellect to which the previous modes of thinking, prevalent both in the Jewish and Gentile world, necessarily conducted. It is a compound of Judaism and Gentilism; a doctrine which created a sort of marriage union between the spiritualism and revelation of the Jews on the one hand, and the materialism and metaphysical philosophy of the Greeks on the other. Pythagorus himself in many respects resembled Jesus Christ; he left no writings behind him; he talked in parables and mysteries to strangers, and told his secrets to his select disciples; he even took great pains to conceal his real doctrine. His followers pursued the same mysterious course of instruction, which caused them to be feared and hated, and at last driven out from Cortona and Italy. The way of the Jewish Messiah was also prepared by Plato and the Stoics; the one giving interest and respectability to the most refined species of idealism, and the other recommending a thorough contempt of all the pleasures of sense, in comparison of the higher enjoyments of the mind. Moreover, in different parts of the world, large sects or societies of men entertaining such ascetic notions, had established themselves apart from the common society of the world, and sought the "*summum bonum*," or greatest happiness, by acting in direct opposition to the prevailing practices of the rest of mankind. The Therapeutæ of Egypt were a set of mystics, who concentrated within themselves the greatest proportion of the reigning mystery and monkism of the age. This was to be expected, for Egypt was the fruitful source of all the philosophy of the ancients. The Essenes amongst the Jews were very much allied to the Therapeutæ; their chief peculiarity consisted in the severity of their moral discipline, abstinence from all the sensual pleasures which give man an interest in the affairs of this world, and in life itself. These were growing sects, and as we have already seen, the philosophy of the age, unlike the mechanical and chemical philosophy of our own times, was intimately associated with and running into them.

Now, as Nature in her progress along the course of time loses nothing, but gathers together all her scattered fragments, what sort of compound could we reasonably expect when she sent her first-born Messiah to collect these divided elements together? Nothing, certainly, but a compound of mysticism, monkism, stoicism, platonism, materialism, and spiritualism.

Well, when Christ appeared, did he seem to be acquainted with all these doctrines? No; he was acquainted with none of them; he spoke what his own mind brought forth, and what he spoke was not understood: but, by and by, as it came out into the world, it was found that it presented a bait for all the religious and philosophical sects of the age; and as they crowded to the centre of attraction, new ideas flashed betimes into the minds of the Christian enthusiasts, who found sayings of their master to give sanction to every sort of mysticism and asceticism that their heart inclined to. The lover of good cheer found a good example in Christ himself, who went about eating and drinking with publicans and sinners. The mendicant and the monk fortified themselves with the appropriate text—"Take no thought

for the morrow; to-morrow will take thought for the things of itself." The Essenian and the advocate of personal chastity found a pearl in the suitable and inspiring sentence which follows:—"Some men are born eunuchs, and some are made eunuchs of men, and others have made themselves eunuchs for the kingdom of heaven's sake." In fine, it was soon found what the apostles themselves had no idea of—that the doctrine of Christ was a nucleus for all the prevailing forms of religion and philosophy, and by it they were all speedily absorbed, like the rods of the magicians by the rod of Aaron.

Some of our modern Infidels, perceiving the resemblance between Christianity and previous sects and doctrines of philosophy, and eager to get hold of an extinguisher to put out the obnoxious luminary of priestly mismanagement, have suddenly taken in the idea that there never was such a man as Christ; but that Christianity is nothing else than Therapeutism, Platonism, &c. The latter idea is correct enough, for Platonism and Therapeutism are both in Christianity, which is the first universal gathering of the scattered elements of mind; but the other idea, of the non-existence of Christ, is rather too visionary to require any refutation. The discussion of the question, however, will lead to good results. It contains an allegorical truth; namely, that the Christ is yet to come; for the *second* gathering is the true gathering.

The Christians, on the contrary, go to the very opposite extreme, and attempt to destroy the resemblance which subsists between Judaism and Gentilism. Each party carries an erroneous idea to excess, merely from the intense desire of destroying its rival; for each has set out with the erroneous notion, that itself has all the truth, and the other all the error. The Christian imagines that his faith is all literally correct; the Infidel imagines that it is literally false. The Christian imagines that God is in his religion, and not in any other; the Infidel imagines that God is in neither one nor another, but that all are *chance-begotten*. The Christian, upon his fundamental principle, attempts to show that his religion has no relation to any other religion upon earth; the Infidel, seeing a relation, denies a distinction, and says the gospels are merely heathen productions adopted by the priests. It is a real matrimonial quarrel between a termagant wife and an ill-humoured husband: the one says "yea," the other "nay;" the one says, "I shall," the other, "You shan't;" the one says, "It was so," the other, "It was not," &c., till sleep overpowers them. Which of these two parties was in the right, reader? You seem to say, "Why, I don't know; I think they are both out of humour with each other, and so very unreasonable that it is best to leave them to fight their own battles."

There never lived a greater original than Jesus Christ, and his originality just consists in the all-embracing character of his doctrine. As for his divine mission, it would be folly to doubt of it. Time and space have already confirmed it, and who but a fool can lift his voice against *two* such arguments as these? Who can dispute the divine mission of the sun to shine by day, or of the moon to shine by night? The only answer to such a species of

scepticism would be, "There they are!" But the objector replies, "I see spots upon the sun, and the moon's face is all covered with dirt and pocks—it could not be God that made them!" Well, well, you simpleton; he gave the devil a commission to make them, and that is the same thing. You may have it your own way,—only "there they are!"

But the divine mission of Christ, and the final meaning of his mission, are two very different things. Moses had a divine mission also, and he appointed sacrifices of bulls, calves, sheep, birds, burning of incense, &c., for an atonement for sin. All this came to an end, although God himself set it up; for as mind progressed, these types or embryos of more advanced institutions gave way like youth at the approach of manhood; and as manhood progresses, the church will yet merge into another state of matrimonial union, when as great a change shall befall the present form of Christianity as befel its predecessor of old. To destroy is impossible; but Nature is for ever changing in the world of progress, though still the same.

But, says the stagnant believer, the Tory Christian, who must have things as his forefathers had them, "The final meaning of Christianity is established by miracles and the mission of the Son himself." But the final meaning of the Mosaic law was established by miracles also, and God himself came down on the Mount to confirm them. Miracles prove nothing; they only serve to set the thing up. Judaism and Christianity are important departments of the plan of Nature; and they required to be established by some means—both true and false—inasmuch as they were not final, for the third dispensation is still in reserve. I can see the use of true miracles to set them a-going, and the use of *withholding* miracles to let them come down, and the use of *false* miracles and impostures to shake their credit; but you can see no reason why they should fall at all, and why Bible and Missionary Societies should be totally deserted by that very Spirit who has promised to spread the truth over the whole earth. Every thing is simple to me, because I see Nature progressing; but to you it seems as if God were asleep, or weary, or unable to contend with the devil. The world is in a similar state to what it was at the time of Christ; full of contending sects, but with the additional advantages of science and the press; and it is only waiting for a uniting doctrine, which shall collect the scattered elements once more, and complete the religious union of mankind by the irresistible demonstrations of science.

THE SHEPHERD.

SOUND.

EVERY sound is rendered stronger or weaker, and may be heard at a greater or less distance, according to the density or rarity of that elastic fluid by which it is propagated. According to Mr. Hauksbee, who has made deep researches into this branch of philosophy, when air has acquired twice its common density it transmits sound twice as far as common air; whence he reasonably concludes, that sound increases, not only in direct proportion to the density of the air, but in proportion to the square of this density.

If sound was propagated in an elastic fluid more dense than the air, it would be carried proportionably farther. I have proved this, says M. Brisson, by putting a sonorous body into carbonic acid gas or fixable air, the density of which is about one-third more than that of atmospheric air; the consequence was, that at that time, and in that situation, the sound was very considerably increased. For the same reason, the dryness of the air, which increases its density, has a considerable effect in rendering sound louder and more audible. Sound is also much increased by the reverberation of the pulses of the air from those surrounding bodies against which they strike, whence it happens that music is so much louder in a close apartment than in the open air.

Elastic fluids are, however, not the only medium through which sound may be transmitted; for it may be propagated by means of water and other liquors, which may be proved by immersing a sonorous body in water; but it must be observed, that in this case the sound will be less perceptible, and will not extend to so great a distance; the cause of this diminution is, because media for the transmission of sound should be elastic, and that is a property which water and other liquors possess only in a very restricted degree.

Sound is also transmitted by solid bodies, provided they possess a sufficient degree of elasticity to produce this effect.

Light, we have already seen, is projected or reflected with incredible velocity; but sound is transmitted much more slowly, and its progression is very perceptible to our senses. The flash from a cannon, or even a musket, may be seen some seconds before the sound reaches our ears. As the motion of light, therefore, is instantaneous with respect to any moderate distance, this has been the common means employed for ascertaining the progress of sound. Sir Isaac Newton observes that "all sounding bodies propagate their motions on all sides by successive condensations and relaxations; that is, by an alternate progression and return of the particles; and these vibrations, when communicated to the air, are termed pulses of sound."

All pulses move equally fast. This is proved by experiment; and it is found that they pass about 1,142 feet in a second, whether the sound is loud or low, grave or acute.

Some curious experiments were made, relative to the propagation of sound, by Messieurs de Thury, Maraldi, and de la Caille, upon a line 14,636 fathoms in length, having the tower of Mount Lhéri at one end, and the pyramid of Montmartre at the other extremity of that distance: their observatory was placed between those two objects. The result of their observations was these: 1st. That sound moves 173 fathoms French in a second, when the air is calm. 2d. That sound moves with the same degree of swiftness whether it is strong or weak; for these gentlemen observed, that the discharge of a box of half a pound of gunpowder, exploded at Montmartre, was heard at Mount Lhéri in the same space of time as the report of a great gun charged with nearly six pounds of powder. 3d. That the motion of sound is uniform; that its velocity neither accelerates nor dimi-

nishes through the whole course of its progress. 4th. That the velocity of sound is the same, whether a cannon is placed towards the person who hears its report, or a contrary way; in other words, a great gun fired from the Tower of London eastward, would be heard at Westminster in the same interval of time as if it was discharged towards the latter place; and if the gun was discharged in a direction perpendicular to the horizon, it would be heard as soon as if discharged in a right line towards the hearer. By other experiments, however, the progress of sound appears to be impeded by a strong wind, so that it travels about one mile slower in a minute against a strong wind than with it.

A knowledge of the progression of sound is not an article of mere sterile curiosity, but in several instances useful; for by this we are enabled to determine the distance of ships or other moving bodies. Suppose, for example, a vessel fires a gun, the sound of which is heard five seconds after the flash is seen; as sound moves 1142 English feet in one second, this number multiplied by 5 gives the distance of 5710 feet. The same principle has been already mentioned as applicable in storms of lightning and thunder.

The waves or pulses of sound being reflexible in their course, when they meet with an extended solid body of a regular surface, an ear placed in the passage of these reflected waves will perceive a sound similar to the original sound, but which will seem to proceed from a body situated in a similar position and distance behind the plane of reflection, as the real sounding body is before it. This reflected sound is commonly called an echo, which, however, cannot take place at less than fifty-five feet; because it is necessary that the distance should be such, and the reverberated or reflected sound so long in arriving, that the ear may distinguish clearly between that and the original sound.

Reflected sound may be magnified by much the same contrivances as are used in optics respecting light; hence it follows, that sounds uttered in one focus of an elliptical cavity are heard much magnified in the other focus. The whispering gallery at St. Paul's cathedral in London is of this description; a whisper uttered at one side of the dome is reflected to the other, and may be very distinctly heard. The speaking and ear-trumpets are constructed on this principle. The best form for these instruments is a hollow parabolic conoid, with a small orifice at the top or apex, to which the mouth is applied when the sound is to be magnified, or the ear when the hearing is to be facilitated.—*Economy of Nature.*

ASSIMILATION.

ASSIMILATION, in physiology, is that property, or principle, or whatever else it may be called, by means of which organised beings, whether vegetable or animal, take to themselves, and convert to their own substance, structure, or organisation, those foreign substances which constitute their pabulum or food. The subject is one of great importance, more so, perhaps, than any other of a merely material nature which can draw the attention or exercise the industry and sagacity of mankind. Upon it depends the success of every method and instance of culture, and the condition and value of all that can be cultivated. Upon it also depend our bodily strength and health, and all that can render life worthy of being enjoyed.

The first process which the food undergoes may be said to be purely mechanical, and might be done by other means. The process is mastication, or chewing, on the part of many of the mammalia; trituration or grinding in gizzard birds; and maceration, or softening, and solution in a fluid, in some other animals; but in whatever way it is performed, it is a merely preparatory process, not at all connected with assimilation; and when there is a liquid in the case, it is to be considered only as a mechanical solvent, that is, as softening or dissolving the food with which it mixes, much in the same way that water softens and dissolves glue.

This preparatory operation, and indeed the whole process of assimilation, depends a good deal upon the nature of the food. When that is entirely animal, the whole of the processes, and also the apparatus by which they are performed, are much more simple than when it is wholly vegetable; and even in the case of vegetable food, that which is wholly pulpy and farinaceous requires a simpler apparatus and processes than that which is mixed with fibrous matter. The adaptations of all the parts of this apparatus (which, taken together, are called the *digestive system*, or *nourishing system*, of the animal) to the various kinds of food upon which animals live, exhibit some of the most beautiful instances of means and end that are to be met with in the whole economy of nature; and they are also of great value in that natural classification of animals, by means of which the history of one is made to throw light upon the history of a number, and one part of the history of one is made to throw light upon the other parts. The general law is, that the nearer the food in the state in which it is received by the mouth approaches to the nature of the animal receiving it, the apparatus of assimilation is the more simple, and the operation the more easily performed. But still, so much is each animal an independent being in its substance, that no kind of food goes into the substance or constitution of an animal without undergoing a total change in the process of assimilation. Even if the animal preys upon its own species, as is by no means uncommon among some of the fishes, in which case the food and the feeder may be supposed to make the nearest approximation to each other, the food undergoes as complete a change as if it were the substance most foreign opposite and to the nature of the animal that can be imagined. It is worthy of being borne in mind, too, that in the same animal, or

ASTROLOGICAL COINCIDENCE.—Mr. Speer, of Hammersmith, and Mr. Hemmings, of St. Martin's Parish, London, were both born nearly at the same time, and very near the same place, as George III. They both went into business when the king was crowned, married on the same day, and died on the same day, as did his Majesty. In the London newspapers for February, 1820, these facts are recorded by men who show their enmity to astrology on every occasion,—they are not, therefore, fabricated.

the same species, the product of assimilation is nearly the same, however different the food may be; or that different kinds of food produce differences in the *quantity* of assimilated product, rather than in the *quality*. Consequently, when we say that the food of an animal is of bad quality, we simply mean that it is deficient in nutriment; or if we have any further meaning, it must be, that the food contains some deleterious ingredient, which in so far acts as a poison.

The second part of the process is *digestion*, which usually takes place in the true stomach of the animal, although some animals appear to have a digestive power in the gullet, or passage leading from the mouth to the stomach. It is here that the mystery begins; for though the stomach may be said to exert both mechanical and chemical powers in the process of digestion, yet there are other results produced in it which cannot well be attributed to either. While the process of digestion is going on, the stomach is in continual motion, contracting in one place and expanding in another, as if it were wriggling as a worm does; and hence this is called its *vermicular*, or worm-like, motion.

The most powerful, as well as the most singular agent in the stomach, appears, however, to be the *gastric juice*, a peculiar fluid, which is secreted or given out by the inner coat of that organ, and which not only exerts a very powerful action in chemically dissolving the food, but also produces some changes in it which cannot be explained upon any known principles of chemistry. The energy of this fluid has been proved by direct experiment: it has been obtained from the stomach of the living subject (which is neither difficult, nor attended with the slightest danger); and by being kept at nearly the natural temperature, it has, to a considerable extent, effected the process of digestion in a separate vessel, in which there could be no vermicular motion to assist its action.

This gastric juice is somewhat singular in its operation. It will dissolve cartilage, bone, and even, in some cases, iron; but it will not dissolve the skin of a berry, the least bit of cork, or the smallest fibre of cotton wool. It is one of those animal fluids which are so perplexing to the chemist in his investigations, and might alone demonstrate the fact, that life is something which neither mechanics nor chemistry can reach, and in the production of which they can consequently have no concern. Not only while in the stomach of the living subject, but after it is removed, this fluid produces what appear to be very powerful chemical effects; but when we subject it to chemical analysis, we are unable to detect in it any ingredient to which such effects could chemically speaking be attributed: in other words, we discover nothing.

There are two properties of the gastric juice, which seem worthy of separate notice. These are, the prevention of putrefaction, and the coagulation of albumen. The first of these is in opposition to one of the theories of digestion, by which it was maintained that that process is a species of putrefaction. But so far is that theory from being true, that it is well known that if putrid matter of any kind is admitted into the stomach, or any part of the digestive organs, in many animals, it is attended

with serious and even fatal effects. The gastric juice, while it performs that sort of decomposition which is necessary for preparing the food for assimilation, prevents the putrefaction to which the food might otherwise have a tendency; and it seems also to prevent chemical solution by the action of one part of the food upon another. Chemical actions, such as the production of an acid or a gas, do indeed sometimes take place in the stomach; but these are always disagreeable, and consequently the results of something wrong in the functions of that organ. The coagulative power is, perhaps, more singular; but coagulation is a subject upon which our knowledge is very obscure and vague. The fact is well known, however, even to those who are equally ignorant of chemistry and physiology. There is not a nurse in the country, but knows that the stomach of an infant is disordered, when it returns the milk of its nurse uncurdled; and dairymaids have from time immemorial employed the *rennet*, the red or gastric juice from the stomach of animals, for curdling milk in the manufacture of cheese.

The action of the gastric juice, assisted by the vermicular motion of the stomach, converts the food into a uniform pulpy mass, changed in appearance and odour, and which is known by the name of *chyme*. This name means that which is softened and mixed together; and, therefore, it is expressive of the substance, though not of the process by which it is formed. The solution is, indeed, a peculiar one; the food is reduced to a pulpy mass, and though there may be a difference in the food, that mass is, in the same species of animal in the same state of health, always nearly the same. The solution which it has undergone is a peculiar one; for though it is softened and moistened, it is not dissolved, neither is it soluble in water.

When the food has been properly reduced to chyme, the action of the stomach forces it through the pyloric opening into the duodenum, where it mixes with new secretions from the animal, and undergoes another change. Not far from the commencement of the duodenum, at the pyloric orifice of the stomach, the gall and pancreatic ducts pour their contents into it; the first the bile, and the second the pancreatic juice. What specific part these perform in the general process of assimilation, is not known; but it is presumed that their action, especially that of the bile, is very important, both because of the size of the liver by which it is produced, and because of the great derangement which takes place in the whole process of assimilation when that organ is diseased.

At or near that part of the duodenum into which the biliary and pancreatic secretions are discharged, the chyme begins to be separated into two parts, the relative proportions of which vary with the quality of the food. The first is the *chyle* (which means juice or extract), a milky fluid, which is the assimilated matter; and the refuse, or that part which is either indigestible or unfit for being converted into chyle. But the latter still contains a portion of chyle, or matter fit for being changed into chyle, and that is gradually separated in the progress through the remaining parts of the intestinal canal.

It appears that vegetable food is acted upon with more difficulty by the gastric juice, in the first part of the pro-

cess, than animal food; and it further appears that, after it has been converted into chyme in the stomach, the chyle is with greater difficulty separated from the refuse. For the preparation of vegetable food, by mastication in the mouth, by maceration in preparatory stomachs, or by both, is a much more complicated operation. The intestinal canals of vegetable feeders are also much larger, and the chyme is in consequence subjected to a greater continuance of the action of these viscera. The contents of the intestines are urged onward, from the entrance to the termination, by a sort of vermicular action, which is called the *peristaltic* motion, and which bears some resemblance to the motion of the stomach, only it is more progressive.

(To be concluded in our next.)

ASTROLOGY.

WE shall reserve our own remarks on this science for a future period; and in the meantime we shall hear what friends and foes have to suggest on the subject. One thing, however, is evident, that it never could be properly studied till now; for as long as astronomy was in an infant state, the calculations of astrologers must have been very imperfect. Past errors must, therefore, be overlooked, and cannot be admitted as objections.

The following is the dedication of the *Grammar of Astrology*, published this present year (1834) by Zadkiel the Seer:—

"To Sir John Herschel, Bart.

"Sir,—The indefatigable industry of your highly honoured father and yourself, to render the knowledge of astronomy complete, must rank your names among the benefactors of mankind in after ages. The great correctness with which the places of the planets may now be calculated, offers a means of examination into the truth or falsehood of the doctrine of astrology, which did not exist in the days of your able predecessor in astronomy, *Kepler*, who, as you are aware, was one of the great men who believed in and studied astrology.

"I am not aware what your own opinion on the art of foreseeing future events by the heavenly bodies may be; but if you choose to amuse yourself, or unbend from your severe studies by examining it for yourself, the present work, I believe, will give you the ready means. In that case, I would recommend as a first effort, the *Nativity* of Prince George of Cumberland, as the time of birth having been particularly well noted and published by authority, may be considered as authentic. The figure of the heavens at Berlin, for the moment of the young prince's birth, and the places of the planets at the time, were carefully calculated and published by me, in the *Herald of Astrology* for 1832; and you will observe, Sir, that the moon being in close square aspect to the evil planet, Mars, together with the other circumstances, has, in strict accordance with the rules of the science, caused the royal native to become blind. And it is worthy of especial notice, that on the very day the prince had the misfortune to receive a blow in one eye (14th September, 1832), which has eventually led to the loss of sight, the moon was on the place of Mercury as at birth and at the last birth-day; on which birth-day the moon was on the place of Mars at birth, and the sun

in square aspect to Saturn. These, together with other exact agreements with the rules of Ptolemy, occur in this royal and authentic nativity. To common minds they may appear accidental coincidences; but to your superior understanding, as you are of all men aware how little we know of the immensity of the universe or the objects or *modus operandi* of many of its magnificent parts, they will, I hope, appear to deserve further consideration.—I am, &c.,

THE AUTHOR."

"The chief features of this figure of the heavens (Prince George's) are the situation of the two evil planets in the descending parts of heaven,—the sixth house. When so situated, they give diseases of a permanent nature. Both the luminaries are afflicted by Mars, the Sun being in exact semi-quartile aspect from him, and the Moon applying to a close zodiacal square, and *precisely* in mundane square. The Sun is only 7 degrees 18 minutes from the mundane square of Saturn. The Moon is in close semi-square of the Sun,—a testimony of *disease to the eyes*; and the Sun being conjoined with the Pleiades and Hyades, nebulous stars, and near the violent fixed star Aldebaran, is another such testimony. But the chief evil is the situation of Mars, who, being in the sign of Aries, which rules the head, was, when taken with other influences, most decidedly a cause of *blindness*. Mars is in mundane parallel (equal distance from the meridian) with Mercury. And Ptolemy says that "Mars will cause blindness by a *stroke or blow*, and if he be configured with Mercury, it will be effected either in a place of exercise or sport." It is the case that this native received a *blow* by *playing* with a purse, the end of which struck him in the eye, and thus led eventually to blindness. Lastly, we find that Venus is setting, or exactly passing the *west* angle. Now, Ptolemy says that, "if Venus be in one of the angles, and *especially if she be in that of the west*, it also occasionally happens that the natives under such a configuration are likewise INJURED IN THE FACE OR EYES."

"We say, then, here is a clear and indisputable case wherein the rules of Ptolemy are distinctly borne out; and to show that the influence which existed at the moment of birth was developed by directional motion, or in other words, that the full effects were felt when the evil aspects were completed, according to the method of calculation taught by Ptolemy, and illustrated by Placidus, we shall give a few directions.

"The direction of the Sun, as it will be seen farther on, to the semiquartile of Mars, measures to the month of June, 1832; and its effects were to heat the blood, and produce a general tendency to inflammatory disease. The direction of the Moon to the trine of Saturn came up at 13 and a quarter, just at the very age when the evil happened. And surely the fact that the Moon was exactly passing over the place Mercury was in at birth on the very day, nay, at the *very hour of the accident*, will be admitted as evidence for the truth of the science, when it is recollected that Mercury was said by the great master of that science, nearly two thousand years ago, to cause such accidents *by sport*, the exact occasion of this melancholy evil.

"The direction of the Moon to the square aspect of Venus, measured to the spring of 1834, at which time the native and his friends had hopes of a restoration of his sight, through the skill of a Prussian oculist. And it should be observed that Ptolemy states in his third book, that "Venus will ameliorate diseases by medicines." But these good effects were neutralized by the evil di-

rection of the *ascendant to the opposition Mercury*, which came on during the summer, and which did much evil; and this, in our judgment, by means of a journey, on which he over-exerted himself, or took some cold, which renewed the disease.

"The directions to come are generally evil for some time hence. The nativity, indeed, being generally of that character. The approaching parallel of the Moon to Saturn will severely afflict the native's health during the spring; and he may also expect much affliction to his mother, of whose death there will be considerable danger.

"The Moon, in this natus, is the *hyleg*, (that which rules or governs the life or vital functions of the native,) and as at 26 years of age she comes to very evil aspects, his constitution having been previously shaken by disease, we fear that he will hardly be able to overcome the malefic influence of that period; at all events, we are quite certain that if he live to that age, he will then be in *extreme danger of death*.

"In conclusion, we have only to observe that we here defy the whole body of eceptics to deny the accuracy of this nativity, or to show, either that the positions of the heavenly bodies were not just what we have declared them at the time of birth, or that the arcs of direction do not measure to the periods named. We have taken the science just as we found it, and have introduced no new thing therein, unless it be some little improvement in the methods of calculating; and we here give to the world a well-known and undoubted nativity; and on its agreement with the events of the native's life are we prepared to let the science of astrology stand or fall. If those events answer accurately to the aspects which are past, (and this they undoubtedly do;) and if those which are to come should also agree with events which may befall the young Prince,—if he should suffer sickness, and, in short, end his days at the time we have predicted,—we say, in the name of naked truth and common decency, that the world can no longer deny the reality of that sublime science which teaches that all men are subject to the influence of the stars.

"The world are astonishingly ignorant even of what the science consists. We meet men of education who have not a jot more correct notion than the most ignorant of the uneducated, (as we showed in our last number in the case of Mr. Godwin.) The most ignorant of all are men of learning on all other subjects. The public and the legislature have been misled by this means; for nobody would suppose that such men as Mr. Godwin or Sir Richard Phillips were totally unacquainted with a science against which they had ventured to write. If any man ventured to write against any other science, he would be laughed at if he did not first make himself acquainted with its principles, and so be able to refute it by practice as well as theory. This is never done by astrology. It is denied and railed at, but never *shown to be untrue*; which would be the easiest thing in life if it were so. We challenged Dr. Gregory, three years ago, to take any nativity, and prove that the science was unfounded. Two hundred years have elapsed since any one wrote a book expressly against the science, and that was *Gassendi*, who could not work a nativity. If Dr. Brewster, who has railed loudly against the science in his *Encyclopedia*, had taken the nativity of Prince George, the time of which was officially noted, and shown that there was no reason by the science for his blindness, that would have been a stronger argument than all his foul-mouthed assertions that astrologers are 'impostors.'

We give the following summary of the result of the

above-mentioned author's calculations of the nativity of Prince George, as it appears to us to be one of the most plain and unmythified astrological predictions that we have met with.

"Prince George was born at Berlin 4h. 40m. P.M., May 27, 1819.

2nd February, 1835.—"We have no doubt that, within a very few days of this date, the native will be much afflicted by sickness, and that his mother will be also a sufferer about this period, and may be in some danger of death."

1836.—"Summer and autumn will bring some advantages to the native's father, probably he may receive some new martial appointment. The native himself will be sickly; yet he will receive benefit by means of surgeons and surgical instruments. About the winter of the same year, the native will have some fortunate changes take place. It is likely he may have some increase to his fortune. He will travel, and be in better health than previously. If ever he recover his eye-sight, it will be under this benefic influence.

"About the age of eighteen years and nine months, he is in danger of receiving some severe blow on the head, &c. About the age of twenty years and a half he may expect to lose some relation by death, probably his father. The twenty-first year is extremely full of trouble. Twenty-one and a half is especially evil, in accidents, losses, deaths of relations, danger in travelling, &c. The twenty-third year is rather evil, and when nearly completed some benefits will accrue, and the native is freed from former troubles.

"At the age of twenty-three years and a half, a feverish attack and accidents; much trouble and vexation about twenty-four. At twenty-four years and a quarter, his health will be dangerously ill; and great care will be requisite to avoid some peculiarly distressing complaint, such as his grandfather suffered. He will be much afflicted at these periods, and as he approaches twenty-five, the evil rather increases. If his father be then living, there are tokens of his death.

"At twenty-five years and a half there appears a renewal of the disease under which he has previously laboured.

"A most violent and fatal train of directions about twenty-six years. If the native should reach that age, of which we have some doubt, he will feel the effects about the middle of May, 1843, and we fear that it will be of fatal consequence. The new moon took place on the 22nd day of June, 1819, at fifty-five minutes past three P. M. (Berlin time), which was exactly twenty-five days twenty-three hours and twelve minutes after the natives' birth. This, at the rate of *our year for one day*, amounts to twenty-five years, eleven months, and eighteen days, which will be on the 15th May, 1843; and as the moon and sun will be both in exact square to Saturn, we have no doubt but the worst possible effects will ensue about that time: the aspect of Jupiter is too far off, we fear, to save life, though it may enable him to linger some time; and indeed, such is the powerful nature of this influence, that we are led to believe that some degree of *violence*, such as a fall from a carriage, or a sudden blow, will be the proximate cause of the fatal evil we foresee."—*Horoscope*.

We have now allowed the astrologer to speak for himself. We shall as early as possible give the other side of the question, and then compare the reasonings of both parties.

CONSUMPTION OF FOOD IN LONDON.

Arthur Young estimated the cattle of all kinds, in England and Wales, at 2,850,000, in 1770. In 1833, they were probably half as many more, or $4\frac{1}{2}$ millions. Sheep are about five times as numerous, or about 21 millions; and pigs three times, or about 13 millions. Of horses there are about $2\frac{1}{2}$ millions.

London actually consumes, in oxen, calves, and sheep, per Smithfield returns, 160 millions of lbs. per annum, independently of 3-7ths offal. This applies to about 4-5ths, or to 1,200,000 of the gross population, and is about 133 lbs. per annum to each. But pigs, fish, poultry, and game make up an equal weight. Butter is 50 millions lbs. and cheese and eggs as much. The flour and salt in bread is 320 millions of lbs. and a fourth more is used for other purposes, with half as much more of all other grain. Vegetables and fruits are equal to flour. And sugar, tea, coffee, oranges, foreign fruits, &c., are equal to Smithfield. Hence the consumption of London, taking the population at 1,400,000, is as follows:—Smithfield Market, 160 millions; the out-parishes, 27; pigs, fish, and poultry, 160; the out-parishes 27; butter, cheese, and eggs, 100; milk, 29 million quarts, 58; bread, 320; other flour, 80; other grain for man, 100; potatoes, vegetables, &c., 400; Sugar, coffee, &c., 160; total per annum 1592 millions; which divided by $365 \times 1\frac{1}{4}$ millions, is exactly 3lbs. and 2oz. per individual per day; which may be taken at 10 oz. for breakfast, 24 oz. for dinner, and 16 oz. for tea and supper. All which is independent of wine, spirits, drugs, horse-keep, &c. &c.

In the provinces, the quantity is not less per diem; but the proportions vary, and 23 millions in the United Kingdom demand an average 450 lbs. annually of various food per acre, from the 56 millions of cultivated acres, for the ordinary sustenance of the population.—*Facts.*

ANCIENT AMERICA.

The following paragraphs indicate that America has ancient claims, though without written history:—

Humboldt found, in possession of the Indians on the Amazons, engraved green stones, exactly like the Ethiopian and Babylonian, or *Sabeen signets*, described by Mr. Landseer. They are real Jade, perforated, and loaded with inscriptions and figures. They open new fields for investigation. Did the Amazons pass from Africa to South America? Rude figures, resembling the sun and moon, and different animals, are found also sculptured in granitic and other hard rocks.

The ruins of an ancient city, called Palangal, of great extent and high finish, have been discovered by Goo Galindo, in a thick forest, near Poton, in the vicinity of the Missouri; and the neighbouring country is also filled with architectural works. These, and other remains in North America, and the city lately discovered in Guatemala, seem to prove revolutions of which we have no present suspicion.

In the plains of Varinas, South America, are found tumuli and a causeway, thirteen miles long and fifteen feet high, more ancient than the Indians. On the high rocks of Encaramada are sculptured and painted rocks; and also others on a large rock in the plains, which the Indians say were made by their fathers when the great waters lifted their boats to those levels.

Humboldt states, that fragments of ancient painted pottery are found in the woods of both Americas, far

from the residence of man, exhibiting crocodiles, monkeys, and some large quadruped.

The most remarkable monuments of Mexican industry is the Pyramid, or Teocallis, of Cholula; and of Peruvian, the Causeway of Paramo, resembling, in magnitude, Napoleon's road over the Alps. Of course, mountains are the originals of pyramids every where, and the intellect of a beaver invents a causeway, without referring to Egypt or the Old World.

The ancient fortifications, found in the American forests, are judged, by the trees, to be much above one thousand years old.

The Stone-mountain in Carolina is a vast wall of stones, built by an extinct people.—*Sir R. Phillips.*

Gay Lussac and Thenard have deduced three propositions, which they call *laws*, from their experiments on vegetable substances. *The first* is, "a vegetable substance is always acid whenever the oxygen it contains is to the hydrogen in a greater proportion than in water."—*The second*, "a vegetable substance is always resinous, or oily, or spirituous, whenever it contains oxygen in a smaller proportion to the hydrogen than in water."—*The third*, "a vegetable substance is neither acid nor resinous; but either saccharine or mucilaginous, or analogous to woody fibre or starch, whenever the oxygen and hydrogen in it are in the same proportions as in water."

THE IMMORTALITY OF ALL THINGS.

AMID this scene of universal change,
Of infinite variety, of life,
Of death, light, darkness—there prevails
One general rule of order heavenly.

No part of Nature that has ever been,
Can cease to be:—'tis true, it may resolve
Itself into new elements, and become
A new creation; mingling with a part
Of what it was not,—and unlike in all
Save in the principle of life, which gives
A likeness unto all things;—but there is still
Within it that which shall into itself
Return hereafter;—and therein is seen
That beautiful eternity of change,
That power infinite of varied life,
Which is itself an immortality.

Oh, happy thought, for those who love to think
They live for ever!—for while we are made up
Of that which is about us, where is death?
And thus I shall return,—and go,—and come,
For ever and for ever;—it may be
A happier, and a better;—or for worse,
As Nature shall decree, and thou, O God;
Since Nature's nothing but another name
For thee, Eternal! FRANK JOHNSON.

NOTICE.

To-morrow Evening, Sunday 23d, Mr. Smith will deliver another demonstrative discourse at 36, Castle-street East, Oxford-market, in which he will give a further development of the first principles of the New Science of the Harmony of Nature.—Admittance threepence.

Printed and published by B. D. COUSTNS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trogate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Brady, Sheffield; Tinker, Huddersfield; and all Book-sellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 14.]

SATURDAY, NOVEMBER 29, 1834.

[Price 1d.]

SYSTEM OF NATURE.

THE Gatherer having come, as we described in our last, and having collected the scattered fragments of philosophy together over all the civilized world, a thing which had no precedent, and as yet has never found a successor; one would suppose that this would be productive of good to mankind, by creating unity of mind and brotherly kindness, enlisting all under one banner, and embracing all under one common family name of Christians, *i. e.* Children of the Anointed. But what says the science of Nature to this? It says there are two gatherings—an evil and a good. And what say the old Jewish prophets? They say there are *two* anointed ones. Zech. iv. 14. And what says Jesus Christ? There are *two* advents. All these agree.

If you gather men together in ignorance, before they have reduced their knowledge to general principles, and discovered the foundations of truth—is not this tantamount to a dispersion? Does it not merely collect them in order to set them a-quarrelling? They come to contend, and the more numerous they are, the more deadly will be the feuds in which they engage. No sort of weapon will be spared, from the tongue of the polemic to the fagot of the priest and the sword of the militant enthusiast. Hence, in accordance with Nature, the first Gatherer says, “I come not to send peace, but division;” and every schoolboy knows how faithfully he has fulfilled his threat.

Never did a gathering take place in this world, before the gathering of the Son of Mary. Many philosophers and monarchs attempted to accomplish one, but every attempt was visited with a signal defeat. The Grecian philosophers collected great numbers of the learned and the speculative of ancient times within the porches of their schools, and the groves of their academies; and many of the best and the wisest of the ancients were proud to call themselves by the names of Plato, Aristotle, Zeno, and Epicurus. But these were mere handfuls of men, in comparison of the nations, the kingdoms, and the empires of Christians, whose founder exceeded all his predecessors and all his successors in the extent and authority of his dominion and doctrines. He not only founded schools and sects, as others had done before him, but he assumed the magisterial sword, the imperial diadem, and the royal sceptre, and gave a new and a family name to almost every member of the civilized world.

Has not this been a benefit conferred upon society? Is it not one great and important step in the progress of union, that has prepared the way, and made the paths

straight, for the final consummation of the great work of redemption? There is at least one book, and a few principles, which this immense fold all hold in common, how much soever they may differ upon other subjects: and dark as their opinions are upon this fundamental doctrine, it serves as a rallying point to accomplish a more intimate and permanent union when the light of science has dawned upon it. This principle is the fundamental principle of science, as we have already shown; and by its aid we shall still further demonstrate that Religion is the science of Nature in mystery, veiled [from the ignorant mind by dark sayings, and utterly incapable of being understood by the ancients, or even our own fathers.

As we have already said, the first gathering is merely nominal; and, like the first of every thing, proves a failure; but even this failure is necessary to accomplish the second gathering. The divisions of the intellectual world are analagous to the divisions of labour in the arts. One man shears the sheep, another combs the wool, another spins it, another dyes it, and another weaves the cloth; another dresses it, and another makes it into clothes; another wears the clothes; another collects the rags, which soon enter into a new state and circuit of existence. The operations of mind are perfectly analagous. Truth is manufactured in a similar manner; the elements are all in our possession, but they require to be analysed; and in order to analyse them properly, it is necessary that they should be divided into departments, each department being committed to a larger or smaller body of individuals, in proportion to its importance. The first gathering puts these materials into their possession, and immediately the work of elaboration commences.

Now as Nature appears to be always in a state of contradiction to herself, containing two extremes, which really agree, although they may appear to differ, ignorance, as a matter of course, necessarily takes up the erroneous notion, that one is right and the other wrong. This is the first axiom of stupidity, and all the learned and unlearned agree upon it. Hence, they split as follows:—One approves of monarchy, the other of democracy; one of episcopacy, the other of presbytery; one of unity, the other of trinity; one says Christ was a mere man, the other says he was a god-man; one says there should be an established church, the other says nay; one says man is a free agent, the other says he is a necessary agent; the one says the wicked shall be destroyed in hell, the other says nay; the one says the body shall rise again, the other says it won't; the one says the pope is the head of the church, the other denies it, and calls the pope antichrist. The one says the pope is infallible

with a council, the other says he is infallible without a council; another says he is fallible in both cases. One says we are saved by faith; another, by works; a third, by the grace of God, without faith or works. One says there is a God, and other says nay; one says he has a son, and others, "How can that be?" We shall enumerate no more; our readers may imagine the rest. This is the *first* gathering. This is the division Jesus Christ came to send; this is the refraction of the ray of truth, when it enters into the triangular prism of a human mind.

Now all these parties are right; there is not a single proposition there which is not literally correct; each is a tint—part of the ray, but not the whole—and true in the very same sense of the word that *red* is light. Every one will allow that red is light, and yet it may be said that it is not, for light is *white*. Again, red is true light, and yet it is false; for a red medium will tinge all Nature with a false hue. False hue! How can it be false when it is real? When I put on red spectacles, all Nature is red; but false, because I have destroyed the *equality* of the rays, and given a preponderance to one. Colourless spectacles are true, because they are *just*.

Now, my friends, do you want to have a pair of colourless spectacles, through which you may be enabled to see Nature correctly? then you shall have them without money and without price. But, first of all, let us enquire what colourless spectacles are—are they spectacles which *reject* or which *receive* all colours? If they rejected *all* colours, they would certainly be colourless; but you would see nothing, for no light would come through them; they could not be spectacles; they are negative. Then you must *receive all colours*? certainly; receive all, and retain none; otherwise they become coloured spectacles, such as all Believers, Infidels, Unitarians, Trinitarians, Deists, and Atheists wear, who receive the negative or the affirmative alone, and reject the opposite. One says, I believe in positive electricity; his opponent says, negative electricity is the true kind. The two parties frown and scowl upon each other till, by and by, the two electricities unite with a flash, and "where are they?" Which is the true kind? I'll tell you, friends; they are both one kind. Do you never feel yourselves actuated by two opposite wills—one will compelling you to pay away money, while another will inclines you to keep it in your pocket? yet you have only one will after all, and that is to pay the money. These are only the mysteries of Nature; and modern philosophers have already clearly demonstrated this important fact, that all science must end in mystery at last. But there are the mysteries of ignorance and the mysteries of science: we wish to teach you the latter; but we do not promise to remove the mystery, but to make the mystery *demonstrable* by science, instead of being *believed* by ignorance. For instance, it is evident that space is infinite, but we cannot conceive infinity; that time has neither beginning nor end, but we cannot comprehend eternity; yet we can demonstrate both.

But there are many of these contradictions which are very simple and intelligible; for instance, all of you already understand how monarchy, aristocracy, and de-

mocracy are correct in principle—for monarchy is the principle of unity of action; aristocracy, the principle of subordination and superintendence; democracy, the principles of justice and equality: each is right in union with the other two, but each is wrong when it preponderates or destroys the others; for, if there is only one ruler, there can be no order; if there is not one president, there must be confusion; and, if the people are not governed according to their own pleasure, there must be discontentment in a great nation. There are, therefore, three things to be considered in government—individual presidency, subordinate agents, or representatives of the supreme power, and the voice of the people; these three are one—all right in friendly union, all wrong in separation or inequality. The same may be said of Popery, Episcopacy, and Presbytery; these are merely the same in ecclesiastics as the other is in politics. Of unity and trinity we have treated already in former numbers. Of an established church we simply say, that that which belongs to *all* the people, must be connected with the state, for the *public* interest is the state; hence, an establishment is right when unity comes; but that which belongs to a part only is not the state, but a faction; hence, the Dissenters are right.

But how can a Deist or Christian, and an Atheist, be both right? the former because he believes that matter must be regulated by mind, and the other because he rejects the idea of a God who is not connected with matter? Both, however, are decidedly wrong, as experience and the Scriptures teach; experience teaches the marriage union of mind and matter, and the Scriptures teach us that God made man in his own image, *i.e.* body and mind; and Jesus Christ, the material God, is called the *express image of the Father*. Atheism is the leap to the opposite extreme of absurdity, raised up by nature to correct the other; and both are like the positive and negative electricity, which produce rest and tranquillity by union only, *not by victory*.

Such is a specimen of the manner in which we reconcile extremes. It is of universal application, and overwhelming in its evidence, on account of the extreme nicety of its accordance with all the known laws of nature and principles of all the sciences. If you can bring one science to oppose us, we abandon the doctrine for ever. Nay, we shall immediately give it up, if you bring one science whose first and last principles do not clearly corroborate it. It is the science of Nature, and therefore includes every subject, and we shall bring in by and by some interesting departments, of which our readers have little conception. We shall alarm the extreme bigots of both faith and infidelity, we know; but we shall have our pick of readers, whose liberal minds can receive the two extremes of truth, and perform the marriage union of nature.

The office of Jesus Christ was to divide these extremes: "I come to set a man against his neighbour, the father against the son, and the son against the father, and a man's foes shall be those of his own house;" but "other sheep I have, which are not of *this* fold; them also will I bring with me, and there shall be one fold and one shepherd." The first fold is a fold of war and con-

tention—the second a fold of peace. From this correct and scientific mode of analysing the past, it follows that all is right and all is wrong. All is right in its place, but wrong as a permanent and inviolable institution. Human society is progressive. It is like a vegetable, which first grows downwards before it grows upwards. It first takes root in the earth, before it ascends into the light of heaven. It has its successive stages of progress; first the blade, then the ear, then the full corn in the ear. How false, then, must be the principle upon which vulgar infidelity is founded, since it denies the source from which this progress emanates, and the consummation to which it tends! How false also must be the principle of vulgar faith, since it stops the movement of this progress of nature, and attempts to curb the growth of science and the mind, by giving stagnation to ancient creeds, and unchangeable meanings to the mysteries of ignorance; by confining the manhood of society to the lessons of infancy, and making that the ultimatum of knowledge to-day which was suited to the human mind two thousand years ago, when science was unknown, and only the arts were cultivated!

Neither party has occasion to boast; they are equally unphilosophical; but there is more liberality in the infidel, because he is the negative. It is this quality that makes him a better recipient of truth than the other, and it was for this reason that we first addressed ourselves unto him. He is the soil in which the word shall take root, and we do not fear the result. It will bring forth abundantly, and that speedily. As soon as he receives it, the opposite party becomes negative to him, inasmuch as he then has a more affirmative doctrine than they. The vulgar infidel cannot tell what he believes—he only tells what he does not believe. He is in the opposition; he criticises the measures of his rivals; but when he has concocted measures of his own, and got the superiority of his rival by an affirmative doctrine, the parties will then exchange relations to each other; but this he never can do with a negative doctrine, for it is an unalterable law of nature that an affirmative is stronger than a negative. A man who swears in a court that he has seen a thing, is stronger evidence than he who swears he did not see, though standing beside the other.

THE SHEPHERD.

ELECTRICITY.

MAN always runs into error before the simplicity of truth can find a reception in his mind. It is an invariable rule, error first, truth afterwards. The first idea which suggested itself respecting this singular and interesting department of nature now before us, was, that electricity was a distinct and independent fluid, which pervaded Nature, but at the same time was differently affected by different species of matter and different modes of action. So, in like manner, galvanism was supposed to be another species of fluid, and magnetism another, and light another, and fire or heat another; and so on through an endless variety of elements, the coexistence of which, as distinct and independent substances in the same space, all ready to make their appearance as soon as certain exist-

ing causes begin to act, is such a chaotic confusion of ideas, that philosophy becomes bewildered with the maze, and the enquiring mind despairs of ever being able to realize the saying, that truth is characterized by simplicity, and that a wayfaring man, though a fool, cannot err therein.

Philosophers have already discovered so much difficulty in supporting this Babylonish division of Nature, that they are every day becoming more and more alive to the great ultimate truth of the unity or trinity of Nature. Electricity, magnetism, and galvanism, are now demonstrated to be one and the same principle in different modes of action; and this is a very important step towards a much closer union of other principles still vulgarly supposed to be distinct.

Those who have attended to our doctrine from the commencement need not be told that electricity consists of two extremes, an active and a passive, or positive and negative; for without these two extremes there could be no action. This is the first law of Nature—action and passion to begin with. These two kinds of electricity may be produced, the first by rubbing a piece of glass, and the second, by rubbing a piece of wax. Hence the one is sometimes called vitreous or glassy, the second resinous electricity; yet both have the principles of activity and passivity within them. Whenever electricity is excited, it is excited in both kinds. Thus the glass of an electric machine has the positive electricity, and the rubber the negative. If you rub a piece of red wax with a silk handkerchief or warm flannel, the wax has the negative, and the handkerchief or flannel the positive. The action causes a union of the two powers on the spot where the friction takes place, and the one accumulates on the one surface, and the other on the other surface. In no case do they or can they exist alone. If I charge a body with positive electricity, and bring another body near it, that body, if not insulated by glass or wax, or other non-conductors, which do not convey, but only accumulate electricity, that body instantly becomes charged with negative electricity. The negative comes from the earth to meet the positive; and if the two bodies are brought sufficiently near, the two electricities unite with a spark, and both return unto the earth. Two positives won't unite, and two negatives won't unite; but positive and negative only will form a union. Thus we see in Nature the great omnipresent principles of hatred and love, repulsion and attraction.

These two species of electricity bear a close resemblance in their modes of action to the acid and the alkali, or the oxygen and the hydrogen. Acids, we formerly observed, convert vegetable blue into red, and alkalis restore the blue. So it happens with the positive and negative electricity. Dr. Wollaston discovered that sparks of positive electricity changed blue litmus paper into red, and negative sparks restored the redness; and we have formerly observed, that the red rays of light are the seat of oxygen, and the blue of hydrogen; so that the analogy is demonstrated in the most simple manner.

But where is the cause? We have not yet discovered it, even when we have brought it to oxygen and hydrogen; for it is quite as difficult for us to conceive how

oxygen and hydrogen can act and react on each other, as to imagine a dead man playing a guitar. The cause lies deeper still than these, but we can trace it no farther with the senses. The mind alone perceives the necessity of referring the whole causality of these everlasting movements of Nature to a sensitive active principle of love and hatred. The union of this twofold living principle with the elements of matter, in a manner analogous to that of the union of our own body and mind, is the ultimatum of philosophy. The vulgar materialist stops at the matter, and talks of action and reaction in language which is unintelligible to himself or others; but experience, which is our only guide in every subject of philosophy, defies the attempt to accomplish a divorce between materialism and spiritualism. They are the two extremes which are universally coexistent, and as inseparable as the two sexual principles of electricity, galvanism, and magnetism. When therefore we resolve all the movements of Nature into two material principles, possessing an active and a passive character, let it not be supposed that we do not also resolve them into two spiritual or mental principles, of which the material are merely the type or model; for in so doing we should be guilty of as great an absurdity as that of supposing action to exist without passion, or passion without action.

When a body is electrified, the electricity does not penetrate the surface, but merely accumulates on the outside. When the electrified body is globular, it is equally diffused over the surface; but when the body is cylindrical, the electricity accumulates most at the two extremes. When a conducting body, such as brass, iron, the human body, &c., (which are good conductors of electricity,) is brought near to a body charged with electricity, the electricity all collects towards that part of the electrified body which is nearest the body that approaches. It comes forth to meet it, as it were, in preparation for a union, long before that union is effected. Thus, if I approach a highly electrified body without touching it, the electricity accumulates on the part nearest my body, and an opposite electricity is collected in the part of my body which is nearest the other electrified body. I am thus charged with electricity, although I do not perceive it until I approach so near as to cause the union, which declares itself by a visible spark, accompanied by a crackling sound. But how can I prove that I am electrified? I prove it by insulating myself, as it is called; placing myself on a non-conducting substance, such as a glass stool, which prevents the electricity from returning to the earth when the electrified body is removed. And when this electrified body is removed, I find that I have become electrified without contact of any electrified body, merely by drawing electricity of one kind from the earth into my body, to meet electricity of another kind, which was in proximity to my body. This is called induction, and shows the principle of attraction in a very beautiful manner. Now it is evident from this, that those who imagine that negative electricity is merely the absence of electricity, are wrong. Negative electricity is quite as active as positive, only it produces the opposite effects; for it always undoes that which the positive does, and *vice versa*; so that both are positive, and both nega-

tive. They are one in two, and two in one, equally powerful.

They will be best illustrated by their two corresponding principles, love and hatred; for materialism can only be illustrated by spiritualism, and spiritualism only by materialism. Love and hatred are two distinct and opposite feelings, and yet one. LOVE is an attraction to that which is good—HATRED an aversion from that which is evil. But by seeking good I am at the same time shunning evil, and by shunning evil I am seeking good. Hatred, therefore, in teaching me to shun evil, produces love of good; and love, in teaching me to seek good, creates hatred of evil. Love and hatred, then, are merely the positive and negative electricity; the one invariably working into the hands of the other—the one undoing what the other does, and *vice versa*—yet both being in reality the same thing, SELF-LOVE. Thus it happens that strong excitements of hatred and love produce very nearly the same effect upon the nervous system.

When a man is charged with love of any kind, especially self-love, he always produces aversion in every other man. When he is charged with negative self-love, or generosity, he produces love positive. This, however, is more evident in sexual love, which is positive and negative. As the two opposite electricities seek each other, so do the two sexes, and *vice versa*. Positive electricity creates negative electricity, and so in like manner love creates love; and if there are exceptions to this rule of love, there are also exceptions to the rule of electricity; for there are some bodies which are non-conductors—these of course are not affected. Non-conducting bodies, however, may be made conductors by covering them with metal plate; and gold plate is well known to convert the most unfeeling and insensible heart into the most passionate of lovers. The analogy is perfect, and we think we require to advance little more to demonstrate that the positive and negative electricity are male and female principles of nature. We may conclude by saying that strong love always creates strong hatred; for the male in love hates every male that approaches, and the female in love hates every female that approaches. Is it not then true that man was born in the image of God? We shall prove it a thousand other ways, so that none but fools shall deny it. But the Christians have not yet found their mother—*How then can they be born again?* Their God is a male only. Woman has always been overlooked. The mother-god is about to be revealed. "Behold the time shall come that the bride shall appear, and she coming forth shall be seen who is now withdrawn from the earth." "Be joyful, O thou mother, with thy children, for I will deliver thee, saith the Lord. Embrace thy children until I come, and show mercy unto them, for my wells run over, and my grace shall not fail." (*Esdras.*)

ASSIMILATION.

(Concluded from our last.)

THE separation of the chyle, which may be considered as the second stage in the process of assimilation, and which continues, though gradually diminishing, through a considerable portion of the intestinal canal, is very

obscure in its nature. There are three agencies which may be supposed to be concerned in the production of it:—first, the action of the different parts of the chyme upon each other, the efficacy of which is rendered probable by the fact that certain substances are more nutritious when taken into the stomach together than either of them is when taken singly; secondly, the influence of the bile and pancreatic juice; and thirdly, the action of a peculiar secretion of the inner coat of the intestine itself. Whether one, or another, or all of these produce the effect, or if all, how much is to be attributed to one, and how much to another, is not known. Thus, in this part of the process of assimilation also, we are left in doubt both as to the agent and the specific effect.

From the intestinal canal, and especially from the duodenum, in which it is most copiously produced, the chyle is taken up by the lacteal vessels. These are small tubes which open on the inner coat of the intestine, not by mouths equal even to their small diameters, but each by a number of very minute pores, or villi, which radiate from a centre, and whose openings are so small that they admit only the most minute substances. These lacteals with their villous openings continue along the greater part of the intestinal canal, but they become less numerous as the food advances, and furnishes a smaller quantity of chyle. From the intestine they proceed along the mesentery, uniting into thicker trunks, and also anastomosing with each other, so as, in some instances, to form a sort of network. They also contain numerous valves, and as the seats of these do not expand, along with the intermediate parts, the distended lymphatics appear to consist of a succession of little barrels or beads.

All the lacteals discharge their contents into the lower extremity of the thoracic duct, which ascends in the back part of the thorax, and pours its contents into the left subclavian vein near its junction with the heart. Thus the assimilated product of the food is mixed with the mass of the blood. In their course from the intestine to the thoracic duct, the lacteals pass through one or more glands; but whether their contents undergo any change, and if any, what that change is, are obscure points. The chyle differs from blood in many respects, one of the most obvious of which is a considerable admixture of sugar and water.

The chyle does not go to the blood alone, but mingled with the contents of the lymphatic vessels, which appear to fetch their colourless contents from all parts of the body, and united enter the thoracic duct; but as the fluid which they contain comes from the living parts of the animal, it must be considered as a previously assimilated substance; but whether it again enters into the circulation, and if so, what office it performs, are points upon which we have no information, and they form no part of the process of assimilating.

The blood with which the chyle, or new matter, is mixed, does not immediately go over the body in the course of the systematic circulation. It passes immediately into the right auricle of the heart, thence it passes into the right ventricle, where the valves between the two prevent its return. The contraction of the ventricle sends it along the pulmonary artery to the lungs; and

after undergoing the action of the air inspired in breathing there, it returns by the pulmonary vein to the left auricle, thence to the left ventricle, and by the action of that and the systematic arteries, it is sent all over the body. The quantity of chyle which mixes with the blood at each pulsation of the heart must be very small, as there is no trace of its colour in the blood which is sent to the lungs, which has the dark colour of venous blood. But the minute division of the blood in its passage through the lungs must tend to the intimate union of the chyle with it, and it may be possible also that the action of the lungs is necessary to perfect the assimilation, and finally convert the chyle into blood, but the agent and the process in this final step of the process are just as obscure as in the two preceding ones.

We have now followed the progress of the food from its first entrance by the mouth of the animal to its union with the mass of the blood, which is understood to be the fluid which supports the growth and repairs the waste of all the parts of the body. In this we have done nothing more than give a simple outline of the process of digestion; but this is, in truth, all that can be given. We have seen that, besides the merely mechanical preparation of the food, there are three distinct operations: the formation of chyme in the stomach, the separation of chyle in the intestines, and the turning of that chyle into blood after it has passed into the subclavian vein. There may be others, by the glands, through which the lacteals pass, and the union of the lymph with the chyle in the thoracic duct; but instead of knowing how these take place, we have no evidence of the fact that they take place at all; and therefore it would be unwise to darken further with them a subject which in its own nature is abundantly obscure. Our enquiry reduces the assimilation to three distinct processes or acts, and we can tell plainly enough *what* takes place at each of them; but in none of them can we tell *how*, or *by what agency*. We can indeed bring all three home to the living animal, by showing that they are neither chemical nor mechanical; from which it follows that they could not be performed by the properties of mere matter, or originate in any new case, except in the ordinary way in which the animal is produced. This is but a small matter in respect of positive knowledge, but it is an important one in the prevention of error.

But when we have followed the progress of assimilation through all the steps that have been traced, from the mouth to the discharge of the arterialized blood from the left ventricle into the aorta, for the purpose of being sent all over the body, we have traced the process only to what may be considered as the beginning of its most curious work. Out of that general circulating fluid there have still to be elaborated all the parts of which an animal consists, and all the products of those parts, whether they be turned to use in the system, or discharged out of it. Of the same fluid are formed bones, ligaments, tendons, muscles, membranes, skin, hair, feathers, nails, horns, teeth, and all the parts of which an animal with such a circulation as has been described can consist. The blood has even to maintain the vessels, and furnish the fluids, by means of which it maintains its supply. Those

local assimilations constitute the wonder of the matter, in comparison with which all the external actions, habits, and economy of animals, curious as some of them are, sink into comparative insignificance.—*British Cyclopædia*.

ASTROLOGY.

Last week the astrologer spoke; it is now the turn of his opponent. We have several before us at present, none of which however is sufficiently concise and comprehensive to quote verbatim.

"It is a common saying," says the celebrated Bailly, the French astronomer, "that astrology is the mother of astronomy. This is a confusion of ideas. Astronomy is certainly the first—the wise mother of a foolish daughter. It was necessary first to know the stars and to have an idea of their movements and revolutions, before connecting them with the destiny of man, and the chain of human events." He then proceeds to show that two species of astrology arose out of this study of astronomy. One is called *natural astrology*, the other *judicial astrology*. The first professes to foresee and to predict the change of seasons, rains, and colds, heat, abundance, sterility, epidemics, &c., by means of a knowledge of the causes which act upon the earth and the atmosphere. The other occupies itself with objects still more interesting to man. It determines the character with which the individual will be endowed by the Author of Nature; the passions which he will experience; the fortune, diseases, perils, which await him. All his actions are foretold, and if this science were true, man, too well instructed in his destiny, would be nothing more than an actor repeating upon the stage of the world the character he had learned.

The first of these Bailly calls a true science, the second a false. The second is the only one which comes under our consideration.

"It will be imagined," continues Bailly, "that ignorance in abusing the principles of Nature has given birth to judicial astrology; that it has subjected man as well as the atmosphere to the power of the stars; that it has put under their influence the storms of passion, the evil and the good of life, as well as the vicissitude of the seasons. In fine it appears very plausible to say, it is the stars in general which regulate the winds, rain, and storms; their influence, mingled with the action of the rays of the sun, modify the cold or the heat; the fertility of the fields, health or sickness, depend upon their benignant or noxious influence; there is not a blade of grass but all the stars have contributed to its growth; man breathes nothing but emanations which, proceeding from the stars, impregnate the atmosphere; man, therefore, as well as the rest of nature, is subject to them. These stars, therefore, ought to have an influence on his will, his passions, the good and evil scattered in his path; in fine, to determine his death as well as his life. It is thus that one might reason; but it is only ignorance, not the people, who have made this step. Men abandoned to the natural and common light of the understanding, as well as men instructed by revelation, have always considered themselves distinguished in nature, and made to command all that lives, vegetates, or exists, upon the earth. They have regarded matter as subject to the starry influences, but the sentiment of liberty (mind) was never permitted to be under their control."

M. Bailly then proceeds to say that he thinks astrology had its source in materialism. "What difference is there between the man of Spinoza and the man of the astrologer?"

The Spinosist will tell you that all our actions are written before-hand in the great book of nature. An astrologer goes farther; he pretends to know these laws. An astrologer of good faith must necessarily be an Atheist, like Spinoza.

He afterwards says, it was first taught in the temples, and concealed from the people by the priests. "Man would have escaped them if they had entrusted to him the false dogma, that he is a dependent being, whose doom is irrevocably fixed. They would have had no more offerings nor sacrifices. Men would no longer have thought of the gods who had regulated all things in advance, or who did not exist. It appears, that in these temples they made a vow of silence, as of poverty and chastity in modern monasteries." This argument looks rather favourable to astrology. It is evident the priests did not study it for profit, for they concealed it.

"Astrology is not less absurd in the supposition of its influences. How can one conceive that the emanations of the stars, enfeebled by the long passage which they make, could preserve their energy to produce such great effects? How many infants born in the same hour would then have the same character and the same destiny! But in admitting all these hidden agencies, which do not exist, astrology could only indicate the character and passions determined by these influences at the moment of birth. It could discover nothing of the destiny, which depends, not only on the passions, but the circumstances in which a man is placed. The practice of this false art, established upon false principles, has therefore been stretched much farther than these principles themselves will permit."

We have given the substance of Bailly, and the substance of every other who writes on the same side of the question. Their objections resolve themselves into the following:—1st. Fatalism or necessity, or the destruction of the freedom of the will. 2nd. The similarity of destiny which must belong to all born about the same time, as they generally express themselves, although *time and place* is the proper form of objection. 3rd. Materialism. It looks as if they thought it too great a task for a spiritual god to perform, to harmonize the movements of earth and heaven.

The first of these arguments, necessity, is a very weak one—for what is necessity but law? And is not all nature under a law? What is the law of nature, but necessity? Did not necessity make us men—white men—Englishmen; and, in fact, determine all the movements of our life? What bounds can you give to necessity? "Hath not the potter power over the clay, of the same lump, to make one vessel unto honour, and another unto dishonour?" Even St. Paul teaches necessity, and so do the Thirty-nine Articles of the Church of England. The third argument is equally absurd; for it matters not what it teaches, provided it be true. The second is the only reasonable objection, and consequently we shall consider it more attentively.

It is not true that all who are born at the same time must have the same destiny, even admitting the truth of astrology, for the longitude and latitude make all the difference in the world. Two persons may be born at the same instant; one on this hemisphere, the other on the other; the one in day-light, the other at night; in which case nothing could be more opposite than their two horoscopes. Again, they may be only one degree of longitude apart; and if the one was born when the sun was four and a half degrees above the horizon, the other when he was five and a half, there is also an immense difference; for in the one the sun is the giver of life, in the other not, for he is past the fifth degree. There

would be many other changes besides. But suppose two born at one spot and time—then that comes to the point. If astrology be correct, these two destinies ought to resemble, not be the same. It does not follow, however, from this that the fate and character of twins should be alike, for they are never born at the same time. We will take at an average ten minutes between each labour—sometimes there are several hours. This makes a difference of two and a half degrees of the heavens, which is equal upon the equator to the distance of one hundred and seventy-five miles apart; besides, the heavens being divided into twelve houses, and each sign, star, &c., acting differently in different houses, it is only those who have practically examined the subject who can perceive the infinite varieties of position that may be confined within the astrological horoscope. A painter may have some idea of it from the mysterious fact, that although a human face is composed of a very few lines, yet it is utterly impossible to arrange these lines twice in precisely the same manner, so as to give precisely the same expression. There is no want of science in astrology; its principle is extremely simple, and sublime in the highest sense of the word. That it has been sadly corrupted and abused by knaves and fools is evident enough—so has the trinity, and all the other mysteries of Nature; that it is at present little understood is also evident; and, moreover, it is evident that it never can be much understood, supposing it to be correct, because it is infinite; but its leading principles may be so clearly determined, that one may say favourable or unfavourable to a nativity, as a phrenologist says favourable or unfavourable to a particular formation of head, without being able to go into the details of life and character, which can only be revealed by time and events.

The language of vulgar astrology is exceedingly absurd. The influence of the stars! why, we may just as well talk of the influence of music on the rays of light or the seven planets, for we have shown that they are all organised alike; and our own bodies are organised in a similar manner, for anatomists inform us that we have *seven parts*—head, chest, abdomen (*vital*), two arms, and two legs, divided in the very same manner as the other sevens. But what has music or light to do with the making of a child? yet the child, and the music, and the light agree; and if it be found that an harmonious accordance subsists between the aspects of the heavens and the movements of the earth, is it not childish to say, that it is owing to the starry influence? it only proves, what must soon be as clear as light itself, that Nature is organised upon one prime model, and, in preserving that one model, modified to infinity throughout all its departments, it produces one immense system of correspondences. The planets have no more influence upon me than has a magpie upon Mount Parnassus; but there is a planetary system within myself which corresponds in its aspects to the great original which contains me. Let men study all such subjects, if they please, but let them beware of excess: an enquiring mind and a cool head will find truth every where; but a zealot and bigot, whether believer or infidel, will find it no where.

The millennarian has an objection of his own, for he says if an aspect of the heavens produce war at present, why not produce war in the reign of peace? But all the evils of nature are convertible into good. Wars, which were formerly conducted by sword and bludgeon, are now conducted by tongue and pen, and by and by will be spiritualized into love and friendship.

In fine, the most powerful argument against astrology is the supposed case of two individuals born at the same

time and in the same place, and it remains for the one party to prove, and the other to disprove, that their destinies are alike; but it must be practically done—foul-mouthed abuse goes for nothing.

BLINDNESS.

THERE have been many instances of people born blind being restored to sight; as for example, that young lad, about thirteen years old, whom Mr. Cheselden, a celebrated surgeon at London, relieved from the cataract, that had rendered him blind from his birth. This great operator curiously observed the progressive manner of his beginning to see, which he published in No. 402 of the Philosophical Transactions, and in the fifty-fifth number of the Tatler, with his remarks thereon. Here follows an extract of those remarks from the third volume of Natural History, by Messieurs de Buffon and d'Aubenton.

“This youth, notwithstanding his blindness, could distinguish the day from the night, as can all those who are blinded by a cataract. He could distinguish any strong light, as he could also the colours black, white, and scarlet; but he could not discern the form of the bodies. The operation was first made upon one eye: as soon as the young patient began to see, all the objects before him seemed to him as if they were applied to his eyes; and those that appeared the more pleasing to him, although he could give no reason for it, were such as had a regular form. He did not however know the colours which, while blind, he could distinguish by the aid of a strong light. He could not discriminate one object from another, however different their forms were. When the objects, which he had known before by feeling, were presented to him, he considered attentively in order to recognize them; but, all on a sudden, a general act of oblivion followed, from the multitude of things that crowded in upon him for admission.

“He was much surprised in not finding those persons handsomer whom he had loved more than others. He was a long time before he could be made to comprehend how pictures represented solid bodies. He at first looked upon them as plans differently coloured: but when he was undeceived, and, on applying his hands to them, discovered nothing besides surfaces, he asked whether it was the sight or the touch which had deceived him. He expressed great surprise, that in a little space the picture of an object much larger than the space could be contained; as for example, the human countenance in a miniature portrait; which appeared to him equally impossible as to make a quart contain a bushel.

“At first he could bear but a very small quantity of light, and saw all objects very large: but by degrees the first seen looked smaller, as he accustomed himself to see larger. Although he very well knew the chamber, in which he was, to be of less dimension than the house, yet he could not conceive why the house should appear larger than the chamber.

“Before the restitution of his sight, he was but very little anxious about the recovery of this additional sense to him; because he knew not the loss of it, and was conscious to himself, that in some respects he enjoyed peculiar advantages unknown to others who could see. But as soon as he came to view objects distinctly, then he felt real transports of joy.

“About a year after the first operation, the second was performed upon the other eye, and was crowned with equal success. He saw at first, with this second eye, the

objects much larger than they appeared to the other; but, however, not so large as they had appeared at first to it, after the operation a year before. When he looked steadfastly on an object with both his eyes, he said that the object appeared to him as big again, as when he looked at it only with his first eye."

Mr. Cheselden mentions several others born blind, whom he had freed from a cataract, and observed in them the same phenomena, without entering into a like detail. He remarks, that from their not having been used to move their eyes during the state of blindness, it was but by degrees that they learned how to direct them towards objects.

From the result of these experiments, it must clearly appear, that the sense of seeing arrives at perfection but by slow degrees, and is at first very confused; and that we learn to see, pretty nearly, as we learn to speak. A new-born babe, that opens its eyes for the first time to the light, feels, no doubt, the same progressive emotions which have been observed in the lad born blind. By the agency of feeling and custom, the erroneous judgments of infant sight are corrected gradually.

LIFTING EXPERIMENT.—This new fact, lately developed in Italy, merits attention, owing to its illustration of physiological principles. If six persons draw a strong inspiration together, they can lift a seventh person lying on a table, with the tip of their fingers, and with slight exertion. But if they inspire together, and try to lift an equal dead weight, they fail; and, if the seventh does not inspire with them, he is a dead weight. This fact is only to be explained on theories of the editor of this volume. When a man inspires, he converts oxygen into carbonic acid gas, and transfers to his system the difference of the momenta of their atoms. This is his vitality and vivacity, and power of counteracting the weight of his own parts. It is his strength, and that of the six. His frame is less heavy, relatively to its own parts. But, at the same time, the oxygen at the lungs is to them positive electricity; and, by contrast, the surface of the skin becomes negative, or nitrogenous. The one supplies oxygen to the arterial blood, and the other, nitrogen to the venous. The living system is the intermediate body of the animal. The seven, then, are as one body, and each, in the connection, is jointly effected. Electrical action and reaction counteracts weight; and, hence, the peculiar effect of this case.—*Sir Richard Phillips.*

FAINTING FITS.—Fits, by the way, are strange things. Like the hen bird, which has the faculty of retaining her egg till an appropriate nest is built and ready for its reception, so a lady seems to have the power of bottling up her hysterics till there is help at hand, with a chance of hartshorn and water, and every fitting accompaniment. As Major Oakley says, in the *Jealous Wife*, "Did you ever hear of her falling into a fit when you were not by? Was she ever found in convulsions in her closet?"

NOTICE.

To-morrow Evening, Sunday, 30th, at seven o'clock, Mr. Smith will deliver another demonstrative discourse at 36, Castle-street East, Oxford-market, in which he will give a further development of the first principles of the New Science of the Harmony of Nature.—Admittance threepence.

CORRESPONDENTS.

We have received a letter from a reader in Maidstone, complaining of our ascription of design to Nature in the formation of her different organisations! He is astonished to think that we should imagine "that the eye, and the ear, and other organs, are designed for the purposes for which they are adapted." He sees no design in Nature, but only adaptation. Then we can only say that our eyesight is a little better, for we see every thing in Nature, and nothing out of it. The eye is not designed, but only adapted for seeing—the ear not designed, but only adapted for hearing, according to our correspondent, who is a disciple of the old French school of dead materialism, which will soon be where last night's gas light is. There is no difference between design and adaptation. We are glad, however, that our friend sees adaptation in Nature. It matters not to us by what name he calls it. We are not very scrupulous about words, for we are always so very condescending as to give people their own choice of terms before we begin to argue with them. It is amusing to see the fetters which our modern atheists put upon themselves in respect to the use of language; witness the following from Sir R. Phillips, whom no one will accuse of deism, or living materialism; speaking of bees, he says, "The whole economy of bees bespeaks design, purpose, and intelligence in the insects, under habits adapted to their powers and form." There is design in the bee that makes the honey, but only adaptation in the power that organised the bee! This is the light that is to enlighten the Gentiles! We shall be glad to insert any argument from our Correspondent in support of adaptation versus design—for our own part, it seems to us like air versus atmosphere. Yet there is truth in it. There is no design in Nature, for Nature and design are one and the same thing. There is no harmony in music, for harmony and music are one, since there can be no music without harmony. Thus our correspondent is right, but not in his own sense; he must be a little more logical before he be omnipotent.

There is nothing more marvellous than the bigotry and prejudice of the mind. The greater part of men hate and reject every thing they have not yet known or received. One man is very much offended with the Shepherd, merely because there is an article on astrology in it! When will this moral persecution cease? However, we are happy to hear that our System of Nature has destroyed the prejudices and revolutionised the minds of many, and we believe we shall be spared to do much greater execution in time to come. The sale of the work is increasing, and it is picking out new readers; but we shall by no means be disconcerted though it should come down. We shall raise a new battery. The doctrine shall never die from henceforth. It has taken root. We expect opposition, for our hand is against every sect and every sectarian doctrine, although in favour of all.

In answer to Q., we reply that there are two distinct species of materialism; one we call dead materialism, or the chance-begotten system of the vulgar atheist; the other, living materialism, which impregnates universal nature with life, intelligence, and all the other attributes of mind.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 15.]

SATURDAY, DECEMBER 6, 1834.

[Price 1d.]

SYSTEM OF NATURE.

"AND why did the Gatherer not come sooner? Why come so late, or rather so soon? and why in such an insulated part of the world?" are the common-place queries of inquisitive minds. We have already shown good reason why he should come from amongst the Jews above all other people; for they held the doctrine of the unity of God: the trinity, and the second gathering, belong to the Gentiles. But we must also show reason why he came at the time he did come. Many, in reply to this query, would say, "Why, he must come at some time or other, and why not then, as well as any other time?" This is the answer of ignorance. Nature is under the government of regular harmonious laws, and these laws are as orderly in the progress of mind as in the vegetation of a plant, or the growth of a human being.

The time of birth of a child is in general pretty accurately predetermined by the mother. The time of quickening, and the turning of the child's body in preparation for birth, are equally regular. The first teeth appear at a certain time of life, and the second teeth supplant the first about the same age in all. Puberty is as regular in its approach as sun-rise, and all the phenomena of progress in Nature have a similar established order; which order, when discovered, we call a law of Nature. The same order exists on the great scale as we discover on the small; but as there is no repetition on the great scale, the growth being accomplished only once, we must look for the LAW amongst those departments of Nature which are unchangeable; such as light, music, &c. Music being the best representative of order, harmony, &c., ought to be the best model for us to follow. Let the following figures represent the monochord, gamut, or seven notes:

1 2 3 4 5 6 7 8

There are two semitones in No. 1, one semitone in No. 2, and two semitones in No. 3; in all, five; so that five semitones make a third. Again; there are two semitones in No. 4, and one in No. 5, making in all eight; so that eight semitones are equal to a fifth. Thus a third, a fifth, and an eighth are one, or concords; but the fifth is the centre of the three. There are two in No. 6, and two in No. 7; in all, twelve semitones in the monochord: a fifth is two thirds. Suppose these seven notes to be the seven colours, taking the spaces between for the rays; then the three concords occupy the places of the three original colours: blue between 3 and 4; yellow between 5 and 6; and red between 7 and 8.

Well, now we have drawn our plan, let us inform the

reader that one day is with the Lord as a thousand years, and a thousand years as one day. Seven thousand years therefore are a week of the Lord, and between 7 and 8 is the sabbath. Let us take the chronology of the world, then, just as we find it, just as Nature has established it, for that is our standard in the System of Nature. We care not for individual theories about the age of the world, or whether the common chronology is right or wrong. A gentleman, at one of our evening lectures, opposed us upon the supposition that it was wrong. We are perfectly indifferent about it; it suffices to us that it is current, although its currency is no proof of its truth. Then, according to the current chronology of Europe, Jesus Christ came at No. 5, or about the year 4,004. This was a *fla* in the musical monochord, or five *full* tones. But Jesus Christ was the seed of Abraham, to whom the promise was made. Abraham is the father of the great dispensation which is going on at this day, and has embraced the whole of the civilised world. But Abraham was born 1996 years before the Christian era, or 2000 before Christ himself was born. Abraham, therefore, appeared at No. 3, the other concord. But these two won't finish the string; there are three spaces to fill up before you come to the 8th; and the last of these is the seventh space, or the sabbath of rest, which begins at No. 7, or *anno* 6000. But, as it is a day of rest, the work must all be done on the preceding six; and the overthrow of all the present systems of iniquity must take place in the intervening period from this till then. The final space, between 7 and 8, is universalism—rest and truth to *all* people—peace on earth, and good-will to men—the spreading of the everlasting gospel of *good news* to the *poor* over the whole world. This, however, is a work of progress; it must begin with one nation first, then be adopted by others. Afterwards, these combined will establish it amongst all the nations of the earth. The happiness attending it will be a sufficient guarantee for its success. The poor will flock to it, because it will feed them with real substantial food for the belly, as well as instruction for the mind. It will not annoy them with mysteries which they cannot understand, or creeds that are revolting to nature and humanity. It will lay down the fundamental principles of Nature and Religion, which are one and the same thing, and reconcile all sects and parties, by the fulfilment of their hopes, and the scientific illustration of their dogmas. Then, according to the prophet Micah, when he describes the millennium, "all people shall walk, each one in the name of his own god, and we shall walk in the name of the Lord our God for ever and ever;" for all the gods will be found to be one God, and

unity shall prevail universally on all the general principles of politics and religion. The monochord will be complete.

We have now given a scientific reason, as people call it (although every reason is scientific), for the appearance of the first Gatherer at the very time he did come; and we need not repeat what we have already pointed out, that the world was prepared for his appearance. But it may be replied by some, that the chronology of the Greek Bible is very different from the current chronology of Christendom; for, according to the Septuagint, Christ came about the year of the world 5872, or near No. 7 in our list of numbers. This was urged by the Christian Fathers as one argument in favour of Christianity; for that was the time when the ancients expected him. How this chronology got into the Septuagint we know not, and shall not enquire; but this we know, that a fifth in music is a false eighth, since it consists of eight semitones. That there should be a universal but false persuasion that the end of the world was come at that period, is therefore quite in accordance with the analogy of Nature; and that there should be a confusion of dates is also quite reasonable to suppose; but the old Grecian dates were soon found to be unsatisfactory; and the learned of Europe, by the aid of historical analyses and astronomical observations, have at length agreed upon the one at present in use, which is at variance both with the Hebrew and the Greek: the false note was rectified, and the progress continued. But even in this error there was truth; for it was the only way in which the character of the mission could be illustrated. Nor was this the only deception attending the coming of the Jewish Messiah. All was deception together. They expected that he would become a king and deliver the nation; then they expected that he would come again in that generation to judge the world. "Verily, verily, I say unto you, there be some standing here who shall not taste death till they see the Son of Man coming in his kingdom." In all these expectations they were disappointed; for instead of the true Christ, they found the false—the spirit of Antichrist, who began his work immediately. This is the false fifth, which, according to musicians, is the greatest discord in use, and is within a hairbreadth of the true fifth; but both fifths are false eighths, *i. e.* not final.

Well, when is the real truth to come? On the day that man is made, most assuredly; man is made on the sixth day, that he may enjoy the seventh. This is the second creation, the new birth so often spoken of, when man shall know the rudiments of truth, and begin for the first time to reason upon correct general principles, and be a man. It is the reign of the third person in the trinity, called the spirit, on account of the superior intellectual character of the third stage of progress. The Comforter, the Holy Ghost, the Spirit of Liberty, &c., these are the names of the spirit of reformation. "I have yet many things to say unto you," says Christ, "but ye cannot bear them now; howbeit, when he, the Spirit of Truth, is come, (he had not come then,) he will guide you into all truth. The Comforter whom the Father shall send in my name, he shall teach you all things, and bring all things to your remembrance, whatsoever I have said unto you. *He shall glorify me, for he*

shall receive of mine, and shall show it unto you." That is, he shall finish my work which is yet imperfect, and he shall do with Christianity what Christianity has done with the law—bring a new thing out of it, and establish the living law of Nature for ever, for the law of Nature is the law of God. Other laws are but as messengers to prepare the way before him, and tutor the human mind so that it may be able to use liberty without abusing it.

God's law is perfect, and converts

The soul in sin that lies;

God's testimonies are most sure,

And make the simple wise:

They more than gold, yea, much fine gold,

To be desired are;

Than honey, honey from the comb

That droppeth, sweeter far.

When Jesus Christ, therefore, destroyed the Mosaic law, he might with great propriety say he came not to destroy the law, but to fulfil it, for he was advancing the world a step towards the great law of liberty, of which St. Paul informs us the other law is but a shadow; and when the gospel of the priests is destroyed, and Babylon the great, the church of confusion, which is drunk and bloated with the blood of men, and feasting on the wages of every species of guilt, is swept away with the besom of reformation, neither will this be a destruction of law or gospel, but a fulfilment of both, an establishment of the spirit which both contained, but which the ignorance of man could not heretofore develop; for as the tree must first blossom before it bear fruit, and as the fruit must first be *sour* before it be sweet, so also are the institutions of Nature and God progressive institutions, first evil, then better and better, till the harvest come, and the consummation is enjoyed. Who can deny these things? Infidel or Christian, let him bring forth his objections, if he has any. He will refute our doctrine when he has demonstrated the fallacy of the multiplication table, but not till then. We have taken so sure a position, that the Christian who denies it must deny his bible, and the infidel who denies it must deny the truth of all modern science. We do not challenge, that is too hostile a word, but we invite them both to overturn it if they can, for we are against them both. Like Ishmael, the son of Abraham, our hand is against every man; for we say that all the old world has been in error, and infidelity is as much a part of the old world as faith is: they always went together, like positive and negative electricity, one at the one end, and the other at the other. They will die together.

THE SHEPHERD.

Some people have called us infidels; we disavow the name. The priests and their blind followers are the infidels. They have broken the law and the testimony, and trampled on the holy covenant. Infidel! Unfaithful! an ugly name! Yet true it is all men are infidels; and the nominal infidels are like the publican in the parable; they have humbled themselves by this name of reproach. They are the more likely to enjoy the promise: "He that humbleth himself shall be exalted, but he that exalteth himself shall be abased." These words will assuredly be fulfilled.

GRECIAN AND ROMAN SCULPTURE.

THOUGH we find traces of the art of Sculpture in all nations, back to the remotest antiquity, even till its origin fades in the mists of time and fable; yet it never attained any degree of excellence as an *imitative art*, until it became memorable in GREECE. In that land of poetry and enthusiasm it assumed a grand and important aspect, and became the delightful means of reminding the people of events in which their fathers had been noble actors; and the same spirit of liberty that impelled their sires to deeds of fame, inspired their sculptors to commemorate them by groups of beautiful statuary, in the forms and expressions of which were enshrined the most sublime genius and exalted intellect. The very best works of the early sculptors of Greece remained for a long time but rude copies of Egyptian art; nor could it be otherwise, when carving, instead of being studied as a separate profession, was practised by ingenious mechanics amongst other common callings by which they existed. SICYON, "the mother of the arts," is said to have had a school of sculpture as early as 1234 years before the Christian era; and it is to one Dibutades, who was the founder of this ancient school, that the honour of inventing the art of modelling is ascribed. The story of this circumstance is generally narrated in the following pretty manner:—"For this discovery, so precious in its subsequent effects, Dibutades, who was a potter, became indebted to his daughter, who, inspired by love, traced upon the wall, by means of a lamp, the shadowed profile of the favoured youth as he slept, that with the imperfect resemblance she might beguile the lingering hours of absence. This outline the father filling up with clay, formed a medallion, which, even in the time of Pliny, was preserved as a most interesting relic." Several centuries necessarily elapsed before sculpture was conducted upon any thing like legitimate principles. It advanced, however, steadily but slowly with the moral and political improvements of the country. Wood was the material mostly used; but there is good reason to believe that metal and ivory were sometimes, though very rarely, used by these early artificers. About the 38th olympiad, or 649 B. C., was rendered a lucid period in the history of sculpture, by the introduction of marble, after which its advances towards excellence became marked and decided. This beautiful material is said to have been first used by Malus, who was attached to the Chian school, in which bronze statues were first executed. From this time sculpture was very generally practised, when the dry style of the early schools began to disappear. That formal exactness of detail, the regular and tasteless arrangement of the draperies, the laboured execution of the curls, in which every hair was defined with useless minuteness, so destructive to a general and harmonious effect, began to fade away, and sculpture, in the hands of artists such as Bupalus, Anthemis, and Myron, arrived almost at its greatest excellence. It was reserved, however, for Phidias to effect the most noble achievement in sculptural art; his mighty genius soared above all his predecessors, and gained an altitude which none have dared to reach. The Elgin marbles, in the British Museum, were executed under his immediate

superintendence, and many of them are doubtless the work of his own hand. They have been spoken of frequently, so as to make it unnecessary to say much about them here. I would recommend all who can, to go and see them; for it is as objects of sight that they are valuable; they want no describing: see them, and they will describe themselves. And if they do not call forth sentiments and impressions of a high character at first sight, I very much doubt whether any description of them will have the effect of improving them in the sight of the observer.

The grand and lofty style of Phidias is generally considered to have died with him; when a new school succeeded his, the distinguishing qualities of which were the most delicate softness and refined elegance, which acquired for it the flattering title of the "School of the Beautiful." Lysippus and Praxiteles, the two favourite sculptors of Alexander the Great, were the great luminaries of this school, which flourished in the grandest era both of literature and art that the pen of history has ever recorded; for during the time of Philip and Alexander, Socrates, Plato, Demosthenes, Aristotle, Apelles, Xenophon, Æschylus, Euripides, Sophocles, Aristophanes, Menander, Philemon, and the three great sculptors that we have last mentioned, flourished. Lysippus worked only in metal, and although it is reported that he executed six hundred and ten subjects, not one of them has come down to our time that is well authenticated. We may form a pretty correct idea of the excellence to which Praxiteles had attained, when we recollect that the Medicean Venus, which "enchants the world," is but a mere copy of the famous Venus of Gnidos, which was wrought by this finished master, who was considered by the ancients to be the first man who arrived at true excellence in expressing the mild, soft, and refined qualities of feminine beauty.

But it may fairly be asked, at this stage of our enquiry, What are we to understand by the term BEAUTY? Does it exist simply in matter; or are a variety of qualities required to form this enchanting power? These are questions which have never been satisfactorily answered. If the African were asked to show you a living model of female beauty, the qualities that he would point out as specially beautiful would differ as "wide as the poles asunder" from the canons of European loveliness; yet it is more than probable that early habit and association would have made any one of us prefer the colour, form, and expression of the African to those of our fairer beauties. In my opinion, no such a thing as beauty exists in the world. One form of matter appears more lovely than another, merely because we have been taught to consider it so; for if beauty were an intrinsic quality of matter, it would be certainly felt by all possessing the sense which relates to it. The fact is the reverse of this, for persons who admit the beauty of certain forms, colours, and proportions in one set of objects, are disgusted with the same qualities when they view them under different circumstances. An object is only beautiful when the mind is stimulated to conceive a train of ideas of a social, gratifying nature, which were first started and suggested by

the particular form, colour, or expression of the particular object called beautiful. Mr. St. John, in a clever essay on this subject, says, "The principle of beauty, whatever it is, appears to hide itself among the deepest roots of our ideas, so that its true nature has never yet been perceived by any one; to discover what it is, seems to require a series of meditations, no less continuous and profound than those which conducted Newton to the theory of attraction and gravitation, and the discovery would at least be equal to the discovery of a world." To conceive a fine idea of female loveliness and beauty, such as appears in the works of the old masters, requires a wonderful effort of genius; and to convey the ideas to others in real shape and magnitude, requires also an astonishing mastery of art.

After this necessary digression, we must proceed to follow the fortunes of Grecian Sculpture in her downward flight; for after the death of Praxiteles, art began rapidly to decline. As the liberal institutions of the country gave way to oppressive thralldom, the inventive faculties of the artists became chilled, and instead of copying nature, they were content to imitate in marble the bronze statues of the great masters: and most of the antique statuary of Greek workmanship which has reached our times was wrought about this period; works of originality and thought ceased to appear, and though a lucid ray occasionally illumined the horizon of fading art, the fate of sculpture foretold the fate of the empire, which dwindled into a Roman territory.

Without halting to contemplate sculpture from its earliest dawn in Italy, where its character and antiquity were very similar to those of Greece, we must be content to take a hasty glance at the effects produced on art by the Romans during their palmy days of glory and of greatness. The habits and feelings of this extraordinary people were strongly tinged by an ardent spirit of conquest; being daring, impatient, and enthusiastic, they thought it were easier to transplant the flowers of art from Greece, than take the more circuitous routine of progressive gradation. With this intent they not only carried away the finest specimens of art, but also the best living artists, to people Roman palaces with a beautiful marble population. The soil, however, was too raw and rude for the agreeable arts to flourish in: the fruits, being forced, soon died, or quickly degenerated; and, notwithstanding the patronage of Sylla, Pompey, Cæsar, and Augustus, we have no account of any native sculptors of any excellence. All the public monuments and great works of talent were carved by Greek artists, whose chisels had lost the Promethean power they once possessed in the Greek republics, of striking living and breathing fire out of cold, lifeless stone. During the Augustan era, the arts were revived, but to give evidence of past, rather than present or future excellence. During a period of two hundred and forty years, from Augustus to Trajan, sculpture was practised on Greek methods, but with fearful inferiority of effect. Hadrian introduced a new style, in which affected finish and mechanical minuteness were the principal characteristics. The decline of art from the reign of Antoninus to that of Constantine was quick indeed; and the Romans, who conquered the

world, and gained an eminence of power which no petty locality can hope to do again, through a want of general enthusiasm and liberty among the many, have shown the poorest claims to real excellence in literature as well as art: they were a conquering, but not an intellectual and inventive, people. The Greeks left something behind them worth imitating, which proved an excitement to true excellence in the paths of true glory and unsullied honour. The Romans left nothing behind them but mere copies of the extraordinary productions of their predecessors.

In my fourth and last paper on this subject I shall give a rapid sketch of Sculpture, from its reappearance in Italy in the thirteenth century, down to the present time.

ONE OF THE UNWASHED.

HISTORY OF ASTRONOMY.

FROM the year 800 till the beginning of the fourteenth century, almost all Europe was immersed in gross ignorance. The only people who paid any regard to science, was the Arabs that settled in Spain. Profiting by the books they had preserved from the wreck of the Alexandrian library, they cultivated and improved all the sciences, and particularly astronomy, in which they had many able professors.

From the beginning of the ninth century to the year 1423, when Purbachius appeared, there is no name that deserves to be mentioned, as contributing to the advancement of astronomy. Purbachius was a man of great talents; he began an Epitome of Ptolemy's Almagest, but died before it was completed. This was executed by his friend and pupil, John Muller, commonly called Regiomontanus. This man made many observations, and collected the writings of many of the ancient astronomers. He published ephemerides for thirty years to come, wrote a theory of the planets and comets, and calculated a table of signs and tangents for every degree and minute of the quadrant. He died in the year 1476.

Nicolas Copernicus, born 1473, rose next, and made so great a figure in astronomy, that the true system, discovered, or rather restored, by him, has been ever since called the Copernican system. He revived the old system of astronomy taught by Pythagoras, which had been set aside from the time of Ptolemy. His understanding at once revolted against the explanations which that philosopher had given of the motions of our planetary system; and set about correcting his mistakes, by laying the foundation of what is at this day held to be the true system of the world. This system he gradually improved by a long series of observations, and a close attention to the writings of ancient authors. His first grand work was printed in 1543, under the care of Schoner and Osiander; and he received a copy of it only a few hours before his death, on the 23d May, [1543, at the age of seventy years.

After the death of this great man, there were several astronomers of considerable note, that greatly improved the science; but the only one that claims particular notice was Tycho Brahé, a Danish nobleman, who was the inventor of a new system, a kind of semi-Ptolemaic,

which he vainly endeavoured to establish instead of the Copernican. His numerous works show that he was a man of great abilities; and it is to be regretted that he sacrificed his talents, and perhaps his inward conviction, to superstitious considerations. He restored the earth to its fancied immobility, and made the sun and moon revolve round it; yet the planets he made to revolve round the sun, which was a still more absurd hypothesis than that of Ptolemy. But we ought to forgive this error, or rather weakness, in return for the many observations and discoveries with which he enriched astronomy. No man ever made more observations than Tycho Brahe.

Contemporary with Tycho flourished several eminent astronomers, among whom was the famous Kepler. To him we owe the true figure of the orbits of the planets, and the proportions of the motions and distances of the various bodies which compose the solar system. The three great laws of Kepler may be said to be the foundation of all astronomy. Kepler was born in 1571, and died in 1631.

Galileo was the next person who rendered any very important services to astronomy. He was the first who applied the telescope to astronomical observations, and with it made many useful and valuable discoveries. By the observations and reasoning of Galileo, the system of Copernicus acquired a probability almost equivalent to demonstration. By espousing the opinions of Copernicus, he drew on him the vengeance of the Inquisition, who decreed that he should pass his days in a dungeon; but he was liberated after the expiration of a year, on condition that he should never more teach or hold up the Copernican as the true system of astronomy. He was born in 1564, and died in 1642.

In spite of the Inquisition, or the passages in Scripture which were always brought forward as objections to the motion of the earth, the system of Copernicus gained ground every day.

Contemporary with Galileo were a number of astronomers, who contributed to the progress of the science. Baron Napier published his tables of logarithms in 1614. Bayer, also, obtained great celebrity by the publication of his *Uranometria*, in which the stars were designated by the letters of the Greek alphabet, which is still the case on our celestial globes and planispheres.

Gassendi, a French philosopher, saw the planet Mercury on the sun's disc, which was the first observation of the kind. A little after this, in the year 1633, Mr. Horrox, an Englishman of very extraordinary talents, discovered that Venus would pass over the disc of the sun on the 24th November, 1639. This event he only mentioned to one friend, a Mr. Crabtree; and these two men were the only persons in the world who observed this transit, which was the first transit of Venus that had ever been viewed by human eyes. Mr. Horrox made many useful observations about this time, and had even formed a new theory of the moon, so ingenious as to attract the attention of Sir Isaac Newton. But the hopes of astronomers, from the abilities of this extraordinary young man, were soon blasted, for he died in the beginning of the year 1640, aged twenty-four years.

Hevelius, burgomaster of Dantzic, also rendered himself eminent by his numerous and delicate observations. He founded an observatory at Dantzic, and furnished it with a great many excellent instruments, some of which were divided into so small divisions as 5'. His observations on the spots of the sun, and on the nature of comets, were very numerous; and his catalogue of fixed stars, containing the longitude of above 1888, was remarkable for its accuracy.

It is to him, also, we are indebted for the first accurate description of the spots on the moon.

The improvement of the telescope continued to lay open new sources of discovery. The celebrated Huygens constructed two excellent telescopes, one of twelve feet in length, and the other twenty-four, with which he discovered the fourth satellite of Saturn; which he said afterwards led him to discover the *ring* that surrounds that planet. Huygens was likewise the first person who applied pendulums to clocks. He died in 1695, aged 66.

About this time the Royal Society of London, and the Royal Academy of Paris, were established, each of which has produced astronomers of the first order. The first person appointed to conduct the observations at the royal observatory at Paris, was Dominic Cassini, who soon after discovered the first, second, third, and fifth satellites of Saturn. He also discovered that the planets Jupiter, Mars, and Venus, turned round their axis in a manner similar to the earth. He died in the year 1712.

(To be concluded in our next.)

SPIRITUOUS LIQUORS.

Do you know of any vessels sailing without spirits on board?—Yes, several under the British flag: and here I will take occasion to mention that I am acquainted with some captains of vessels sailing in a highly respectable and extensive employ, who have declared to me they wish their owners would discontinue putting ardent spirits on board of their ships; but each captain is afraid to be the first to make the request; not that he thinks the owner of the ship would himself object, but fearing lest the other captains in the employ, who like spirits, might be displeased with him.

You have spoken of the British ships: are there any American vessels also that sail upon this principle?—Yes, many hundreds.

Do you know also any American vessels frequenting the port of Liverpool?—Yes, very many.

What is the state and condition of their crews?—Most of the captains are gentlemanly in their conduct; the officers are generally temperate, orderly, and well-conducted men; the seamen are a mixture of temperate and intemperate men, as the crews of American ships are a mixture of Americans and Englishmen.

Do such ships sail without spirits on board except for medical purposes?—Yes, they do; many with none even for medicine.

Then, during the voyage, the seamen are of necessity sober?—Certainly they are.

Then, has the sobriety of which you speak reference to the habits of the men on shore?—Yes; on board the ships they of course must be temperate; the captains inform me that they have comparatively little trouble with seamen at sea now, and that they have no difficulty whatever in obtaining seamen to sail on those principles.

And during the time that they are so deprived of

spirits, is their behaviour as orderly, and as proper, and as efficient as in ships where spirits are served?—Much more so.

Do you know any instance of a ship being sent out by Cropper, Benson, & Co., to India, on temperance principles?—Yes, I do.

What has been the result of that experiment?—Messrs. Cropper, Benson, & Co., are so well satisfied with the report of that and other vessels which they have sent out on those principles, that they are increasing the number; and I believe that they are now resolved on discontinuing altogether the practice of sending ardent spirits on board any of their vessels.

Have you heard the opinions of any persons who do not use spirits at sea, as to the effect of that abstinence?—Yes, very many in all situations, captains, mates, and seamen; and the general opinion is, that the use of ardent spirits is a great evil, and that vessels would be navigated with considerable less difficulty without than with them. I would just mention, while I think of it, that the American ships engage many British seamen in Liverpool on temperance principles.

What proportion of the American ships which arrive in Liverpool are conducted on temperance principles?—I should say, at present, at least nine out of ten; so few have ardent spirits on board, that I am quite astonished when I hear an American say he has them.

What proportion of English ships, sailing from the port of Liverpool, are conducted on temperate principles?—I believe there may be about twenty to thirty out of the whole number; and I am credibly informed there are twenty sailing out of the Clyde on temperate principles.

What do you consider to be about the whole number?—Many thousand sail. I would just mention a subject that came under my own notice, with regard to a captain with whom I was intimately acquainted: when I became conscious of the evil arising from the drinking of ardent spirits, I mentioned it to this friend (Capt. McDowall), and he being a very temperate man, thought that there was no necessity for his joining a temperance society, or discontinuing to take the very little that he indulged in; but by my arguments he was enabled to see the evil of the example of even moderate drinking, or of having any thing to do with it; and he resolved from thenceforth to use no ardent spirits on board his vessel, the *Duchess of Clarence*, and consequently he requested his owners would supply him with tea or coffee instead; his owners made no objections, and he has been sailing on those principles for the last three years; and on seeing him in Liverpool some time ago, I enquired of him if he continued to sail on the temperance plan; he replied, "Certainly, and I will never again suffer ardent spirits to come on board of a vessel which I command. I never knew what it was to be truly comfortable at sea until I entirely prohibited the use of ardent spirits on board my ship."

Was it his own personal feeling that he was describing?—Yes, and also his experience with regard to his crew; he said he had never been truly comfortable with them long together until he adopted that system: since that time his men had been obedient and well-conducted, and he had had but one instance of intemperance amongst them, which had annoyed him, since he adopted this plan.

Do the seamen themselves consider that they are better treated in temperance ships by their superiors?—They do; and the American sailors have expressed themselves quite comfortable and satisfied to have coffee and sugar in lieu of drink.

Is it too much to suppose that a captain and mate addicted to occasional drunkenness, may, when in such a state, be petty tyrants; and are the men not relieved

from such tyranny in temperance ships?—They are. Masters of intemperate habits convert their vessels, if I may so express it, into indescribably comfortless abodes; they destroy the happiness of all on board. I will just mention a circumstance which has occurred to me, and which arises out of this question: I remember a very smart, active, intelligent man, who commanded a vessel sailing between Boston and Liverpool; he was very fortunate; he made quick passages; he brought and carried many passengers; he was generally liked and respected, and consequently invited by his passengers, on their arrival, to dine, and occasionally to live with them; he was complimented, and made much of; and from these very circumstances he fell into the pernicious habit of moderate drinking ardent spirits; it increased upon him until he became an intemperate man; he then acted more like a madman at sea than one in his senses; he frightened his passengers, so that in a short time none would go with him; he destroyed the comfort of all on board, and consequently was dismissed from that vessel. He continued his intemperate habits; he brought his family to poverty; he was found in various parts of the town lying in the streets in a state of beastly intoxication. He was afterwards employed a short time in a small fishing vessel, as a common sailor, and finally he drowned himself, either in a state of intoxication, or from depression of spirits occasioned by it.

Did the habit of intoxication keep by him till the last?—Yes, it did.

Do you remember the circumstance of the loss of the *Rothsay Castle*, that sailed from Liverpool to Beaumaris?—I do.

Were there many passengers on board of her?—I believe there were upwards of 120.

Was there any circumstance in the weather, or the coast, which might account for her loss?—I think not.

Was it not in consequence of the drunkenness of the captain, or what was the cause of her loss?—I was personally acquainted with the captain of the *Rothsay Castle*; I considered him a man who drank too freely of ardent spirits. I took a passage with him to Bangor; I spoke to him about it, and advised him to join the Temperance Society; but I lament to say he ridiculed the idea, and used argument to induce me to change my opinion, and join him in taking a glass of whiskey punch after dinner. It is reported by the survivors, and generally believed to be a fact, that the loss of that vessel was occasioned by his intemperance, though I cannot say of my own knowledge it was positively the case.—*Evidence of Mr. Charles Purnell, Dock-master of Liverpool, before the Parliamentary Committee on Drunkenness.*

THE MORALITY OF CHRISTIANITY.

WE never knew a clergyman who taught the morality of the gospel. We have heard thousands of sermons, and read hundreds, but we have neither heard nor read any thing equal to or even resembling the morality of the New Testament. There is not a priest in existence who teaches it, and there is not a man or woman who practises it. In fact, it is a morality which is not for this world. We mean this *old world*, or old system of monopoly and corruption. It is not practicable. It is utterly impossible to be a Christian; and the man who calls himself one, is a deceiver from skin to core.

"If a man love me," says Christ, "he will keep my words." "Ye are my friends if ye do whatsoever I command you." And pray what were Jesus Christ's commands? We have his own words in reply: "A

new commandment I give unto you, that ye love one another." It is an incontestable proof of the enormous amount of hypocrisy and impudence of which the present character of humanity is composed, that so many men can be found so abandoned to all sense of truth and consistency, as to assume the name and character of a system of morals which is the very reverse of themselves, and could only be applied to them in derision and mockery, as the title of Solomon is applied to a fool. "He that saith he loveth God, and loveth not his brother, is a liar," says St. John, "and the truth is not in him." Again, "Whoso hath this world's goods, and seeth his brother have need, and shutteth up his bowels of compassion from him, how dwelleth the love of God in him? My little children, let us not love in word, neither in tongue only, but in deed and in truth." Compare this with the present character of our luxurious and aristocratic priesthood, who are actively employed at this present moment (in Ireland) in scouring the country with bands of armed soldiers, to recover their tithes from the poor, naked, starving savages, who have neither any benefit from their priestly instruction, nor desire to partake of it; and then say whether or not they be Christian moralists who thus rob the poor of their food and their clothing. So much at variance is such conduct with the spirit of old Christian morality, that the great apostle of the Gentiles insists upon the moral obligation of suffering wrong rather than go to law to be redressed. His words are these, 1 Cor. vi. 7, "Now therefore there is utterly a fault among you, because ye go to law one with another. Why do ye not rather take wrong? Why do ye not rather suffer yourselves to be defrauded? Be not deceived, neither covetous men nor extortioners shall inherit the kingdom of God." "Ye have heard that it hath been said of old time," says the master himself, "an eye for an eye, and a tooth for a tooth; but I say unto you, resist not evil; but whosoever shall smite thee on thy right cheek, turn to him the other also; and whosoever will sue thee at the law, and take away thy coat, let him have thy cloak also. Give to every one that asketh, and from him that would borrow of thee turn not thou away."

This is the morality of a beau ideal system of society, and is a sufficient proof that Christian morals are not for this old world; therefore John says, "Love not the world, nor the things of the world; if any man love the world, the love of the Father is not in him." "My kingdom is not of this world," says Christ to Pilate, "else would my servants fight; but now is my kingdom not from hence." Compare this with the fighting priests of Ireland, and their military train of extortioners, and the call of the priests to the English nation at the late Bristol meeting to take up arms in defence of their church and religion, and then say where are the Christians; and if the Son of Man were returning now, if he could not with great propriety say, there is no faith upon earth. Upon whom did Christ pass his censures, when he lived and taught in Jerusalem; on the common people, or the priests and pharisees? On the latter only. "Wo unto you, scribes and pharisees, hypocrites, who devour widows' houses, and for a pretence make long

prayers; therefore ye shall receive the greater damnation." How exceedingly applicable to the present generation of the same species of animals! Within these few weeks past we have in the public papers had several instances recorded of poor widows in Ireland being stripped of their furniture and bedding, merely to put a couple of shillings into the pocket of a priest, whose hard heart, when he heard the pitiful tale, even from the mouth of the wretched applicant herself, melted not, moved not with sympathy. No doubt he prays to God for the poor; good soul!

But, says the parson, in justification of himself, "it is my due; I must live; the law allows me this." Worthy Christian! Is it not the duty of a Christian to suffer when his cause is in tribulation, and even to rejoice that he is counted worthy to suffer for the name of his master? Is it not forbidden him to go to law?—is he not ordered to be content with what he receives, and not to become an extortioner? and moreover, if there is any Christian morality practised in Christendom, where ought we to look for it but in the ministering servants of—I was going to say, Christ, but I will not associate him with the modern priests, for they are as much his enemies as were the priests and pharisees who crucified him.

But are the laity any better? Not a whit. From the king on the throne, who can do no wrong, and is therefore a solitary exception, down through an endless list of pampered nobles, guzzling aldermen, and selfish money-griping burgesses, all and each of them *Christians by profession*, the whole system seems nothing else than a deliberate, premeditated insult to Jesus Christ and all his apostles and evangelists. It is practical blasphemy and despite to the Christian morality. Hear it, ye Christians of every grade, in the words of him whom ye call Lord, Lord, yet do not the things which he bids. "When thou makest a dinner or a supper, call not thy friends nor thy brethren, neither thy kinsmen, nor thy rich neighbours, lest they also bid thee again, and a recompence be made thee; but when thou makest a feast, call the poor, the maimed, the lame, the blind, and thou shalt be blessed; for they cannot recompence thee." Beautiful morality! but it only serves by contrast to blacken the darkness of the degeneracy of our modern piety, and self-baptized Christianity. Antichrist! who is he, and what is he, but the spirit of clerical and professional Christianity? "Thus speaketh the Lord of Hosts, Execute true judgments, and show mercy and compassion every man to his brother: and oppress not the widow, nor the fatherless, the stranger, nor the poor; and let none of you imagine evil against his brother in your heart. But they refused to hearken, and pulled away the shoulder, and stopped their ears that they would not hear."—Zech. vii. 9. At the end of every seven years, according to the law, all debts were to be forgiven; and lest, at the end of the sixth year, some might have a scruple of lending from fear of loss, the law ran thus:—"If there be among you a poor man of one of thy brethren within any of thy gates, in thy land, which the Lord thy God giveth thee, thou shalt not harden thy heart, nor shut thy hand from thy poor brother, but thou shalt open thy hand wide unto him, and shalt surely lend him suf-

ficient for his need in that which he wanteth. Beware that there be not a thought in thy wicked heart saying, the seventh year, the year of release, is at hand, and thine eye be evil against thy poor brother, and thou givest him nought, and he cry unto the Lord against thee, and it be sin unto thee; for the poor shall never cease out of the land; therefore, *I command thee, saying, Thou shalt open thine hand wide unto thy brother, to thy poor, and to thy needy in thy land.*" Compare this with the Poor Law Amendment Bill, and the tithe system.

We shall, in a future number, give the negative side of the question—the counter-morality, or immorality, and show that the priests and their followers have picked out this negative or infidel portion as their portion, and followed it implicitly, for the word is, like nature, a compound of the two extremes, the decidedly infidel or negative of which has been the choice of all from the beginning; for if men are not all infidels by name, they are all practically INFIDELS, *i. e.* unfaithful, unbelieving, uncharitable, and disobedient.

MOHAMMEDAN SCHOOLS.

If the stranger in a Moslem country in passing through the streets is attracted, by a noise for which he cannot satisfactorily account, towards the building in which the school is held, he will, on looking in, probably see a long and narrow room, at one end of which is seated a man with a long beard, while the sides are lined with little boys of various ages, squatted upon their heels on the floor, which is generally covered with a thick mat, in addition to which those parents who can afford it provide their sons with a bit of carpet or felt in Persia, or with a cushion in Turkey, to place between them and the mat. Some of the elder boys go so far as to obtain a cushion to introduce between their backs and the wall; but this luxury is rather discountenanced by the masters as an encroachment on their own peculiar dignities. All the boys have their heads covered; but they are without their shoes, which are left near the door, so mingled, and so similar in shape and colour, that it would seem difficult for each to find his own; but, on the breaking up, every one seems to slip his feet into his own shoes, without any of that individual hesitation or general confusion which might be expected. When the boys are learning their lessons or repeating them to their master, they do so all at once, with a loud voice and with a continual see-saw of the body, without which movement they seem to conceive it impossible that anything can be learnt. The scene which this affords is exceedingly ludicrous to a European, particularly as the zeal of the learner is estimated by the loudness of his voice and the violence of his see-saw; and hence, when conscious of the approach of a person whom it is wished to impress with a favourable opinion of their application and progress, the noise in the schools, which may previously have sunk into a low hum, rises abruptly to the clamorous uproar of many voices. It seems that in reading all at once to the master, the elder boys, if the school is large, are expected to give some attention to the others near them. The master cannot in such a noise distinguish the individual accuracy of each reader; and his attention is therefore directed to observe that time is as nearly as may be kept by the voices, and, in some measure, in the motions also of the pupils. This object seems but poorly attained; but still the attempt so far succeeds, that there is a very sensible difference between the noise of the formal reading and that of the audible conning of the lessons. The style of reading, which this system produces, is most unnatural; being as different as possible from the inartificial tone of conversa-

tion. It is a drawing chant, uttered in a very loud voice. In the East, generally, the tone of the voice is very high, even in common conversation; but in reading it is raised to screaming. A recent traveller relates that some Arabs desired him to let them hear him read. He complied, on which they exclaimed, "You are not reading; you are talking!" The fact however is, that, except among those of the learned professions, few of those who have professedly learnt to read in the schools can or do exercise the acquirement in after life; and the few who remain actually qualified to read with facility, rarely do so without some stimulus, incomparably stronger than would be required in this, or perhaps any European country. After a residence of several years among Mohammedan people, the writer does not recollect more than three instances in which he has seen persons quietly engaged in reading a book to themselves, although all the actions of their ordinary life are much more exposed to public notice than can be well imagined in this country.

When the Mohammedans are brought into contact with Europeans, it is impossible for them not to feel how immeasurably inferior they are to the latter in knowledge, and in that power which knowledge gives. To diminish the difference seems hopeless to them; and under the mortifying consciousness of their inferiority as a people, they often endeavour to console themselves by saying that it is "their fate." The Franks, they exclaim, have all their good things—their knowledge and their power—in this life: but *they* shall have their own hereafter when the "Infidels" lie howling.—*Penny Magazine.*

The Rev. Mr. Acworth, at the North Devon Auxiliary Bible Society, held in the Guildhall, Barnstaple, "invited people going to the metropolis to look in at No. 10, Earl-street, where their astonishment would be excited to see the vast number of the Holy Scriptures on the shelves. It had been calculated, he said, that if the Bibles were placed one against another, as bricklayers construct a wall, they would reach not only from London to Barnstaple, but again from Barnstaple to John o' Groat's, a distance of one thousand two hundred miles, and two of the largest ships in the British navy would not be sufficient to bear up the weight of Bibles now ready for distribution. Fifty-nine tons had already been shipped off to Antigua and Jamaica; and that every negro should possess a copy, it was requisite to ship off one hundred tons more." Mr. Acworth also remarked, that "though England would take the lead in the work of distributing the Bible, there were other nations outstripping it in the Christian undertaking. From America four hundred pounds had been sent in support of the British and Foreign Bible Society; and that country had declared that it was willing to enter into contract with France and England, that every family in the world should be supplied with a copy of the Holy Scriptures." "During the month of August, seventy societies had sent their contributions to London; and the largest contribution to the Parent Society was not from any part of England; neither from Europe, Asia, nor America; but from what he might call a new quarter of the globe—Van Diemen's Land—which had contributed three thousand pounds; but said they must keep back fifty pounds to print a Bible for the inhabitants of New Zealand."

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market.

[Price 1d.]

SYSTEM OF NATURE.

WHAT a fearful and stupifying system of philosophy that is which represents the universe as a chaos of unconscious and unmeaning causes, working they know not how, and understand not wherefore; rolling, and flying, and clashing together, like particles of dust on a Macadamized highway, without either plan, end, or purpose! Yet that is the principle, professed or understood, of all the philosophy of the world. Atheism is merely the excess of the same absurdity, which the doctrine of the priesthood implies.

The doctrine of the priests necessarily leads to atheism: the two doctrines are merely two extremes of absurdity; and if there be any difference, deism is the most absurd of the three. The priests speak of a superintending Providence, a supreme power in Nature, like that of a sovereign in a kingdom, and their doctrine exactly corresponds with monarchy and toryism in politics. Atheism is merely republicanism or democracy, without the principle of monarchy to control and give unity of design. It is the *beau ideal* of a state of anarchy and disunion. The former is the *beau ideal* of a state of tyranny, in which the interest of the supreme ruler is at variance with that of his subjects, inasmuch as he exacts from them that which neither their physical nor intellectual nature can contribute, nor their circumstances permit. The God or supreme monarch of the priest is quite distinct from his creatures and his works, and even looks with abhorrence upon them. The atheist has no supreme ruler at all; he has formed all nature into a pure republic, and refused to admit even of an elective presidency. How to describe the God of the deist we know not, unless we represent him as an old gentleman retired from business, sitting smoking his pipe, and drinking his wine, and occasionally asking his valet-de-chambre how things are going on in the world below, and replying, after a prefatorial whiff and spittle, "Ah! what a set of fools men are! Yet I think I made them well enough, Michael, eh?" "I think so, my Lord; it is their own fault." This eases the old man's conscience, and he folds his arms and arranges his attitude for another century of repose.

The God of the vulgar believer does *some* work; for now and then you hear a pious son of the church or the conventicle say that such and such things are the work of God: "Surely the finger of God is here;" "This was, no doubt, the work of Providence." He is not just so indolent and unconcerned as the lazy old Chronos of the deist. Still it is evident he does not do every thing. Either it would be too great a task for the God of the

priest to do every thing that is done, or it would not suit the priestly doctrine and profession, which must have a list of other powers in existence, besides that of the supreme power, in order to establish a partial government in nature, in which the two extremes of ruler and ruled shall be at variance, and they (the priests) shall stand as mediators between them. Hence the God of the priest does only a small fraction of the work of the universe. The devil does much more work than he in human society; and wicked spirits and wicked men are so many highway robbers, bandits, and vagabonds, who have powers and separate interests of their own, not at all created or influenced by the Supreme, who looks with horror upon their depredations, and strives against them with all his might and main, like Jupiter against the Titans. He promises, he threatens, he exhorts, he entreats, but all to no purpose; the people are as resolved on the side of opposition to the God of the priests, as they are to the King of England, and his military premier. A tory government in the universe is quite as unpalatable to a liberal and intelligent mind, and must in the end become quite as unpopular as a tory government on earth. But as pure democracy without a president is an impossibility in politics, so also it is in Nature: and such is vulgar atheism; it has no controlling mind. The deist is the whig, who keeps his God out of sight altogether, and rules by inferior powers, granting his majesty the Deity only a *nominal* existence.

We have already shown that all these systems are false in theory, and impossible in practice: the one is tyranny, the other is oligarchy, and a third is confusion. But the philosophy of Nature won't teach one thing, and experience another thing. If so, reason would be of no use to man, since chaos reigns supreme. It is the union of these three systems that accords with sound reason, and possibility and success in practice. Individual presidency is necessary to good order; subordinate presidency is also necessary; and the voice or approbation of the people is indispensable. The sovereignty resides in the *whole*, and is only recognized in an individual because he is the representative of the whole. This is the perfection of government. The old school, however, says that the sovereignty does not belong to the people; that it belongs to a family, to a certain rivulet of human blood, called *blood-royal*, differing from all other blood as God from Nature. The difference, therefore, between this doctrine and ours is this, that this makes divinity and royalty only partial and local—we make them universal—we give perfect unity and individuality to God, as we do to the king himself. But we and all nature are included

in God, and must be connected with him in the sovereignty at one and the same time in which the sovereignty of king and people are united; for the analogies of nature move on in perfect concord. Therefore, as long as kings act the tyrant, God does the same, for he it is who conducts the whole drama; but when tyranny ceases, and equality of rights and privileges is established, then, in the words of Scripture, "we (the people) reign with him; we shall be kings and priests unto God, and we shall reign on the earth." And one from amongst the people shall be his representative as supreme ruler—the father of society. "Unto us a child is born, unto us a son is given, and the government shall be upon his shoulders, and his name shall be called Wonderful, Counsellor, the Mighty God, the Everlasting Father, the Prince of Peace." But he shall not be different from another, for he is "chosen out of the people." Then why call him divine? In the first place, we are all divine, inasmuch as we are partakers of the divine nature (2 Peter i. 4.), inasmuch as we are the sons of God (1 John iii. 1.), inasmuch as we are the body of God (1 Cor. xii. 27.), &c.; and, in the second place, because he is the representative of deity; therefore the concentrated power of human society, in an acknowledged representative of the people, when a state of society is established which shall give universal satisfaction, is all that is meant by the Messiah, or God upon earth.

But why did Jesus Christ not fulfil this office? Because he was the *first* in order. The whole secret of the matter lies in that one word of five letters. There are two extreme kinds of monarchy, corresponding to the two Messiahs; the one is monarchy distinct from the people, and the other is monarchy allied to and derived from the people. Jesus Christ is the great representative of the first. He is represented as different in nature from all other men, as doing no wrong, as highly exalted above all others; but at the same time owing this exaltation to his *blood royal*, for he was not only of the *royal family of David*, but represented as being in a particular manner of the royal family of God himself—a *hereditary prince*, and therefore a splendid model of hereditary and exclusive monarchy, which does not derive its power from the acclamation of the people. But he said there was another stage to come, when the Son of Man cometh, and then he will associate the people with him, and they "shall sit with him on his throne." The plan is evident to the most simple mind, and not only simple, but such as declares itself to be the best, if not the only mode of progression in the school of moral and political discipline; and it demonstrates these two important propositions in politics and religion, namely, 1st, "*that the ROYAL POWER is nothing more than the sum total of the power of the people; but it must be represented by an individual.*" 2nd, "*that the divine power, or God, is the sum total of all the power in existence; but it must be represented by an individual man upon earth, inasmuch as man is the highest order of beings which the earth contains.*"

The practical establishment of these two propositions is "the reign of peace and goodwill to men." It is the union of God and man, the very thing for which Christ prayed when he said, "that they all may be one; as

thou, Father, art in me and I in thee, that they also may be one in us." Then God shall be *all in all*. Nothing can be more evident than that this is the consummation of Judaism and Christianity. But hitherto men have been practical atheists. A system divided without a bond of union is atheism, which denies the uniting link of mind, which gives meaning and purpose to the movements of nature. All religious sects have more or less of this nonsense; one says *this* is God's work, *that* is not—the other says, *nay*, it is the very contrary. They have made the universe a chaos of conflicting powers. Not one sect in existence acknowledges the finger of God in all things, or regards God as the unique source of good and evil, and what we call right and wrong. Thus all men are atheists; and the doctrines of the priests lead to declared atheism, because if, like the priest, I deny the power of God in this act, and the visitation of God in this or that religion, and the will of God in this or that movement, I may deny him in any other; and if I deny him in the parts, I may deny him in the whole; for if one part of nature can go on without him, the whole may go on without him. The vulgar believer and the vulgar atheist, therefore, reason on the same principle; the same skull and brain might do for both; and although each regards the other as a fool, and a distinct species from himself, they are birds of a feather notwithstanding. "*There is not a thought of man's mind, nor an act of his body, which is not the immediate effect of the knowledge and power of God.*" [We always speak with authority both of Nature and Scripture: if our doctrine is not supported by these two witnesses, we abandon it.]

To this glorious consummation of the final union of God and man, and of all political and religious sects, we look as the ultimatum of the progress of society. We are Jews in faith; we are waiting, and willing also to exert ourselves for, the redemption of man, to follow to the letter the advice of the apostle, "work out your own salvation, for it is God who worketh in you to will and to do of his own good pleasure." The nature and character of the deliverance we can easily point out, but the precise time and manner we know not. We know that it shall neither be a monarchy, nor an aristocracy, nor a democracy; that neither the God of the priest, the God of the deist, nor the God of the atheist, shall reign in it; that all former politics, all former creeds, gods, and worships, will cease to pervert the minds and cause divisions amongst the people; and that all the *general* promises of God, to be found in all religions of the world, but more especially in the Jewish and Christian religions, because they have been exalted above all others, like man and woman amongst the brutes, shall have a literal fulfilment; the partial promises being merely the veil of delusion with which it pleased Nature to conceal the truth from the national pride and vanity of barbarous times, until liberal opinions should teach mankind that all nations are equal in the sight of God, and that they only are the best deserving of power, who are best qualified by knowledge and virtue to use it. "No prophecy," says an apostle, "is of any private interpretation." It is not a nation, or a family, or a city, which is to be exalted over its fellows. "He is not a Jew who is one outwardly," neither is

that Jerusalem (*the city of peace*) which stands in Palestine alone; but he is a Jew who is one inwardly, and that city is Jerusalem where peace reigneth, where the king and people are of one mind, and the laws of God and the king are one. Then men shall see God. "When the Lord shall build again Zion, he shall *appear* in his glory; he will regard the prayer of the destitute, and not despise their prayer. He will hear the groaning of the prisoner, and loose those that are appointed unto death. He will declare the name of the Lord in Zion, and his praise in Jerusalem, *when the people are gathered together and the kingdoms to serve the Lord.*"

One of our correspondents, whose sectarian prejudices cannot endure anything that gives the least satisfaction to the opposite party, and who is therefore very ill qualified for becoming a peacemaker, either in this world or that which is to come, is not altogether pleased at our quoting Scripture so often!! He signs himself a *Liberal!* Surely, the tragedy of this world is over, and the farce is begun! Does he not know that, in every sense of the word, the Bible is the king of books? Is he aware of its immense circulation in almost every language? Let him read the last number of the *Shepherd*, and he will find that America proposes to join with France and England in agreement to supply "*every family in the world with a Bible in their own language.*" To illustrate that book, therefore, is the highest and the noblest work that a human being can engage in, for it is the *only* literary nucleus around which the human race can gather. No other book can supplant it; and if it cannot be made an instrument of good, as it has been of evil, mankind may sit down in despair, for the book and its influence can never be destroyed. But we rejoice in the circulation of the book, for it is a messenger to prepare the way of the Lord, and make straight in the desert a highway for our God.

THE SHEPHERD.

NEGATIVE MORALITY OF CHRISTIANITY.

By Christianity is understood the whole dispensation of Judaism, from Abraham downwards, the ceremonial part of the law being spiritualized in the gospel; but the moral department, so far from becoming relaxed as it progressed, acquired greater refinement, and assumed a character of greater generosity and self-denial.

It is chiefly, therefore, to the New Testament that the Christian ought to look for his standard of morals. The Old Testament is too lax for a genuine orthodox believer. It appears, however, from our last article on this subject, that lax as it is, the modern professors of Christianity cannot make any approximation to it in practice, nor do they even attempt it; even its simplest and most practicable precepts are contemptuously overlooked, and the self-styled, baby-baptized Christian contents himself with his name and a thing he calls faith, which faith makes him neither a better friend, relation, nor acquaintance, than that other thing called infidelity; but liars, knaves, and hypocrites belong to both sides of the question. Faith thus becomes merely a license from God to enter the gates of heaven, "no questions asked;" a popish indulgence, which with a few grimaces, pious

shakes of the head, and confessions of guilt, enable a man to enjoy this world in a manner quite at variance with the morals of the gospel, and make his peace with God into the bargain.

But how does the praise-loving, poor-despising, well-fed, well-clothed Christian contrive to make his peace with God and disobey the precepts of his master at the same time? That is the point to which we mean to direct your attention. He does so by means of what we have denominated the negative morality of the Scriptures, which is the current morality of the priests, and every one of their followers. This negative morality does not consist of precepts, for then it would be positive morality; but it consists of licences, indulgences, examples, &c., which have all the authority of positive precepts along with them. The precept says positively "do this," and the law says "cursed is every one that continueth not in all things written in the book of the law to do them." But faith, like the serpent in the ear of the woman, says, "Nay, it won't be so; you cannot keep the law; it is too perfect for your imperfections; only believe *certain articles*, (thirty-nine are too many; the apostles had only one, that is, "Believe in the Lord Jesus Christ, and thou shalt be saved," but this is too little for an established church,) only believe *certain articles*, and your sins of omission and commission shall be forgiven, for faith is counted for righteousness." This is one way of escaping from the moral obligation of fulfilling the morality of Christianity, and how faithfully the faithful have taken the advantage of this hole in the wall, all the world knows. The doctrine itself of justification by faith is a splendid doctrine, when properly illustrated; but as taught by the priesthood, and more especially the Protestant church, it is a most pernicious and immoral element of popular instruction.

Besides this loop-hole of faith, there are other negatives, which prove a very valuable cordial to a believer's soul, when sorely beset by the positive commandments of his master. There are the examples of the patriarchs and prophets, and other holy men, whom inspired writers have enumerated in the list of the faithful. Abraham, and Isaac, and Jacob, were all equivocators—we won't say liars, although Jacob got his father's blessing by means of a most bare-faced falsehood,—and his vinyame, according to the Hebrew, may be translated Liar, or Deceiver. David, and Samson, and Jephtha—all men of faith, according to St. Paul—were by no means gifted with any moral virtues which a Christian could perceive if they had the epithet of infidel applied to them; for the lies of the king of Israel, and their fatal consequences, are such as would stamp perpetual disgrace upon the character of a modern soldier.

As for deceit, or holy fraud, as it is called, we have one beautiful specimen of it in the history of Jehu, when he destroyed the worshippers of Baal. He called all the priests of Baal together under a pretence of serving Baal; but he did it in the subtlety of his heart, that he might destroy them; for as soon as they were assembled he said to his soldiers, "If any of the men whom I have brought into your hands escape, he that letteth him go, his life shall be for the life of him." Thus he destroyed them

all. "And the Lord said unto Jehu, Because thou hast done well in executing that which is right in mine eyes, and hast done unto the house of Ahab according to all that was in mine heart, thy children of the fourth generation shall sit on the throne of Israel." This is the counter morality of the gospel. The justice of the act we do not dispute; it was quite in character with the times, and when one party is persecutive, the other must be so also; but it is not the morality of Christ; yet the professors of Christianity have in all ages made it a model, and Christian governments still continue to act in the spirit of persecution which it sanctions. It is evident that in those days faith was always propagated by the sword; and the god of Israel, or the idols of the Gentiles, were worshipped or reviled in the groves and sanctuaries of Israel according as the king and court were disposed to favour the one or other. It is so still; the sword and the prison have been the chief instruments of conversion and maintenance for the church, ever since it numbered kings and generals amongst its disciples. "If my kingdom were of this world," says Christ, "then would my servants fight." The church *militant* is not the gospel of glad tidings for the poor, neither is the church *disputant* a gospel; the first is the established church, the second is the dissenting church. The first is a rude tyrant of a husband, the second a termagant wife, whose clapper tongue and peevish temper is everlastingly annoying her helpmate, whilst both are fairly matched in ignorance and obstinacy. The whole affair is Babylon the Great, the city of many tongues and no understandings; of which the Spirit has sent us a beautiful little emblem in the church of the "unknown," which is only a model of the great church of old Christianity itself, where men speak a language to others, of which neither they nor their hearers have any knowledge.

One would think, from the beatiful and unequivocal injunctions respecting charity and universal benevolence to be found in the Scriptures, that a Christian could have no outlet from such moral obligations as these; but it is not so; he has numerous holes for making his escape; he is taught to regard even the very children of infidels as unholy and unclean; and believing that God himself looks with horror upon heretics, and those who refuse to hold certain articles of faith, and that they are doomed to eternal punishment in a world to come, how is it possible that he can be charitable? Any charity that he has is confined to his own sect; all the rest of men are foredoomed of God, and therefore to be shunned and abhorred by the elect. This counter-charity he also follows in preference to the other; the other is too good for him; he always chooses the worst of the two extremes that are presented. The fact is, that the Bible is a complete type of Nature, containing two opposite extremes, a positive and a negative. The positive morality is what we call good, very good; the negative is bad, very bad; but the negative has always been followed, and the reason is, that the one is for the first Christianity, or old Babel, and the other is for the second Christianity, or the millennial church. It is impossible to keep any other morality than the negative at present, for the church is divided both in politics and religion. The positive morality is

for a time of union in politics and ecclesiastics; but this must be preceded by an utter dissolution of the present systems of church and state.

This negative morality is part of the Christian infidelity; they are equally in error in doctrine; hence, the church is always represented as apostate until the time of reformation, or second coming; and the spirit of infidelity is now at work to pull it down, but, like blind Samson, itself shall expire amid the ruins of the temple.

HISTORY OF ASTRONOMY.

(Concluded from our last.)

ENGLAND, at all times, produced astronomers of the first order; and at this period it had to boast of Hook, Flamsteed, and Halley.

Hook was born in 1635, and died in 1702. He was not only a great observer in every branch of astronomy, but his inventive powers have been exhibited in almost every branch of science. He was the inventor of the zenith sector, an instrument which was used to determine whether or not the earth's orbit had any sensible parallax. He gave the first hint of making a quadrant for measuring angles by reflexion; and he, in some measure, anticipated the discoveries of Newton, by showing that the motion of the planets resulted from a projectile force, combined with the attractive power of the sun.

Flamsteed was born 1646, and died in 1720. After the Royal Observatory at Greenwich was finished, he was appointed by King Charles II. to the management of it, with the title of Astronomer Royal. He made a very great number of observations, which he has recorded in his *Historia Celestis*, and in the *Philosophical Transactions*. But the principal service he rendered astronomy, was by forming a catalogue of 3000 fixed stars.

Flamsteed was succeeded, in 1719, by Dr. Halley, the greatest astronomer, says M. de la Lande, in England; and Dr. Long adds, "I believe he might have said the whole world." He was sent by King Charles II. to St. Helena, in order to form a catalogue of the stars in the southern hemisphere, which was published in 1679. While he was in the island of St. Helena, making this catalogue, he had an opportunity of observing a transit of Mercury across the sun's disc, by which he was enabled to point out the method of determining the parallax of the sun.

On his way between Calais and Paris, he obtained a sight of the famous comet that appeared in 1680, which suggested to him the idea of writing a treatise on the subject of comets, in which he investigates the orbits of these wandering bodies, and predicted the return of the one that appeared in 1759, which is the only prediction of the kind that ever was verified. It is said that during the nine years he was at Greenwich, he made 1600 observations. Halley was acquainted, either personally or by letter, with every astronomer of note in Europe then living. He died in the year 1742, aged eighty-six years; and was succeeded by Dr. Bradley, to whom we are indebted for two of the most beautiful discoveries of which the science can boast—the aberration of light, and the mutation of the earth's axis. He also made a great many observations, in order to discover if the fixed stars had

any sensible parallax. These observations are partly published, and the remainder of them are in the hands of a Mr. Abraham Robertson, to whom their publication was entrusted. Bradley died in the year 1762.

But to no individual is the science of astronomy more indebted than to the celebrated Sir Isaac Newton. This great man was born on the 25th December, 1642, at Woolstrop in Lincolnshire. His discoveries were not confined to astronomy alone; for in mathematics and natural philosophy he was equally great. His chief discovery in astronomy was the law of gravitation, by which he was enabled to account for some of the greatest phenomena in nature. His great work, the *Principia*, appeared in 1686. This work is one of the most valuable books on physical astronomy that ever was published. His discoveries are so numerous and important in this science, that the solar system, or that restored by Copernicus, has received the appellation of the Newtonian system.

In this country there have been several distinguished astronomers since the time of Newton, among whom may be mentioned Dr. Long, Dr. Keil, Dr. Bliss, Mr. Ferguson, Mr. Hadley, and Dr. Herschel; the latter of whom, for his many accurate observations, deserves to be ranked among the first class of astronomers of any age or nation. In the year 1781, on the 13th of September, he discovered the planet *Georgium Sidus*. In the year 1787, he discovered two satellites revolving round that planet: and in 1790 and 1794, he discovered other two satellites. These discoveries of Herschel form a new era in astronomy.

Dr. Maskelyne, late Astronomer Royal, has likewise rendered very important service to the science. He was the first who proposed to the Board of Longitude the publishing of an *Ephemeris* or Nautical Almanack, which was begun in the year 1767. This almanack is still continued annually, and has been of the utmost service to navigation.

Dr. Maskelyne died a few years ago, and was succeeded by the present Astronomer Royal, Mr. Pond, who is also a man of genius, and promises to be of great service to astronomy.

On the continent also there have been many astronomers of great talents since the time of Newton, particularly in France. Among these, La Caille deserves to be mentioned with credit. He was born in 1713, and in the year 1751 he undertook a voyage to the Cape of Good Hope, for the purpose of perfecting the catalogue of the stars in the southern hemisphere. After incredible labour and exertion, he returned to Europe with a catalogue of 9800 stars, which were comprehended between the south pole and the tropic of Capricorn. In addition to these labours, La Caille calculated new tables of the Sun, made observations on the parallax of Mars and Venus, on atmospherical refraction, on the length of pendulums, and measured a degree of the meridian during his stay at the Cape: he died in the year 1762. Contemporary with La Caille lived several very eminent astronomers, of whom may be mentioned Cassini, Bouguer, Condamine, Maupertuis, and Clairaut, who were all employed soon after this, in measuring degrees of the meridian in different parts of the world. Professor

Mayer, of Gottingen, deserves also to be mentioned, as contributing greatly to the improvement of the science, by the excellent set of tables which he calculated for finding the place of the moon, &c. These tables are now used in making the calculations of the Nautical Almanack. His widow received 3000*l.* for them from the British Government, on account of their great accuracy. Mayer died in 1762, aged 41 years. D'Alembert also rendered great service to astronomy by his indefatigable labours, particularly in resolving the problem of the precession of the equinoxes. He died 1783.

Euler, one of the greatest geniuses and calculators that any age or nation can boast of, ought to be associated with the history of astronomy, as one of its most distinguished votaries and improvers. By his many and accurate calculations, he has rendered the most essential service, not only to astronomy, but to all the physical sciences; but his labours are too numerous to be detailed here. The eighteenth century was distinguished by many other eminent astronomers; viz. Maclaurin, Simpson, Bernoulli, Lambert, Mason, Boscovich, De Lisle, Bailly, La Lande, &c.

The celebrated La Grange, who outlived most of his contemporaries, was born at Turin in 1736, and has enriched astronomy with some of the most splendid discoveries of which it can boast. The subjects of his researches in this science were, the theory of Jupiter's satellites, the motions of the planets, and their action on each other, which he determined with great accuracy.

La Place has also distinguished himself by his labours to improve astronomy, particularly in solving the problem of the tides, in adding some new corrections to the lunar tables, and some discoveries respecting the precession of the equinoxes. He also ascertained the mean depth of the sea to be four leagues.

The name of Troughton ought also to be mentioned; for to no individual of the present age is *practical astronomy* more indebted than to this distinguished artist. The great improvements he has made upon astronomical instruments, has rendered his name celebrated in every country in Europe. There is scarcely an observatory of note to be found that does not contain some of Mr. Troughton's instruments.

The names of Dr. Olbers, Harding, and Piazzi, are also deserving of notice, as discoverers of the Asteroids. Ceres was discovered by Piazzi, 1st January, 1801; Pallas, by Olbers, 28th March, 1802; Juno, by Harding, 1st September, 1804; Vesta, by Olbers, 29th March, 1807.—*Carey's Astronomy* (1825).

THE AIR-BAG OF FISHES.

THE air-bag (called also the *air-bladder*, the *sound*, the *swim*, and various other names), an organ with which fishes are very generally provided, and respecting the use or mode of action of which there are many theories and conjectures, but none that are absolutely certain, either as to what is its use, or whether that use, whatever that may be, be uniform in all the species which have it. The common theory is, that it assists the fishes which have it in adapting their specific gravities to different

depths of water, and the consequent pressures to which they are subjected at those depths; and the arguments in favour of this theory are, that those fishes which have it not are generally less discursive, both as to depth of water and to range in distance, than those which have it; that when it is punctured the fishes remain at the bottom, while so long as it is entire they can come to the surface. These arguments are not, however, conclusive, or even very plausible. We know of no animal which raises itself by balloons, whether in the air or in the water; and those fishes and reptiles which have the power of inflating their integuments, certainly never use that power to aid them either in swimming or in flying.

The fact is, that this mechanical theory refutes itself, and never would have been adopted if the parties adopting it had not been ignorant of those very principles of mechanics of which they concluded they were making a proper application. If the air-bag were of such dimensions as that the buoyancy produced by it could have any effect on the ascent of the fish to the surface, it would destroy the fish's command of itself in the water to a much greater extent. Besides, the air-bag has not been proved to be muscular, or possessed of a contractile structure; and the reddish bodies which are sometimes attached to it are organs of secretion. The air contained in the bag is chiefly nitrogen, with a mere trace of oxygen in fishes, such as the mullet, which live near the surface, but with a little more oxygen in the fish which inhabit at a greater depth. In no known case, however, has the quantity of oxygen been found to be equal to one-tenth of the whole. This composition precludes the possibility of supposing that the contents of this vessel can be atmospheric air. As little are they the remains of the air after having been breathed by the animal; for the chondropterygii, with fixed gills, which are the only fishes that receive the air into cavities in the body, have no air-bladders. And yet, if it were the residuum of air taken in from the water, they are the ones in which we might expect to find it, as the fishes with two gills pass the water in a current through these. When there is any connexion of the air-bag with any of the systems of the animal, it is always with the alimentary system, the gullet, the stomach, or both; but there is often no perceptible communication even with these, and when there is not, the air-bag is always furnished with glandular appendages presumed to be for the purposes of secretion, though, as in some cases it has both the connexions with the gullet or stomach, and also the appendages, there is doubt even upon that point of the subject. Indeed, in those cases where the ducts of communication are the most conspicuous, as with the gullet in the sturgeon, and the stomach in the herring, these ducts are air-tight, so that the bag can neither be inflated nor emptied by pressure through them. That the air contained in the bag is secreted either by the glands or the tunic itself is no doubt true, at least in those cases where there is no communicating duct; and as when there is a communication, that is always with the alimentary canal, the probability is that the air-bag is, in some way or other, connected with the digestive system, but in what way, the present state of our knowledge does not enable us to decide. Enough is known, however, to

show that the use is physiological, rather than mechanical—to refute the existing theory, but not to establish a better one. Before that can be done, there must be much careful observation.

The air-bags of fishes vary much in shape, in strength, and in size, as compared with that of the species to which they belong; but till the use of the organ itself is a little better known, no conclusion can be drawn from these differences.

In the arts, the substance of this vesicle is of considerable importance. When freed from fat and other impurities, it is among the most pure animal gelatine with which we are acquainted. Isinglass is the air-bag of the sturgeon, freed from oily matter and dried; and the air-bags of cod are collected and salted in large quantities at the cod-fisheries, and well known in commerce by the name of "cod-sounds." The air-bags of all fishes may be used for the same purposes, though some of them are much smaller than others, and have the gelatine less pure. Inferior ones are, however, often sold for the genuine isinglass of the sturgeon.—*British Encyclopædia*.

JULIUS CÆSAR

THE same misrepresentation of illustrious characters has prevailed through all ancient, as well as modern times; as is shown in the history of the great Roman Dictator, Julius Cæsar, who, though universally allowed to have been one of the most kind, generous, and disinterested of men, is, with singular inconsistency, affirmed to have been justly killed by Brutus and his fellow-conspirators, for destroying the liberties of Rome. The contradiction is, however, to be explained by reference to the actual situation of Rome itself. The government of Rome, like that of all other long-established republics, was so contrived, that the whole real power of the state had become vested in a very small number of individuals, called Patricians, who, by unceasing devotion to the art of public speaking, by a constant use of the word *LIBERTY*, and by flattering the people with the name of freedom, had so cheated them into submission to their will, that they were able to command the services of the bravest and most enterprising nation in the world, and to employ it in any way they thought proper, for their own sole and exclusive benefit; war, plunder, and robbery of every other nation being the result.

One great source of wealth to these Patricians, was a custom they had of lending money at exorbitant interest, to leading persons in the dependent provinces, well knowing they had the power, by themselves or their friends, amongst whom the distribution of provincial appointments was all shared, to enforce the repayment at any time. The petty kings and dependants of the Roman power, were, in this way, drained of their money; and these, in return, were suffered to drain their subjects; so that the provinces were gradually stripped of every thing to enrich the aristocracy of Rome; whilst the plunder of the world, thus acquired by these Patricians, helped to keep the whole Roman people in effectual subjection. For the working classes were prevented from murmuring by public donations and largesses of both corn and money, distributed, at seasonable times, amongst them, and by having constant employment provided for them out of the construction of many costly public and private buildings, which retained them all in subordination; being further beguiled into good humour by a regular succes-

sion of imposing shows and spectacles supplied for their amusement; so that, in this way, the whole Roman people became moulded into ready and convenient instruments for promoting the rapacity of their rulers. It may be seen, in fact, that though the people nominally ruled, they were, in reality, little better than slaves to these patricians, who were the true sovereigns of the nation, holding its *purse-strings*, which last circumstance is the only thing that accounts, in any satisfactory way, for the long continuance of their abominable system of misrule.

This system seems, however, to have reached the highest point to which it could possibly be carried, when Cæsar appeared as a public man. Proscriptions and massacres were, at that time, things of every-day occurrence in Rome, just as one or other faction happened to obtain the superiority; and the contentions of violent men, struggling for power, had become so desperate for want of some commanding authority to keep them in subjection, that there was in reality no government at all; but anarchy and confusion prevailed throughout, the industrious citizens having been entirely deprived of security both for property and person. Of all the grievances, however, afflicting the nation, the greatest was that arising out of the tyranny of the owners of money, whose usurious practices had proceeded to such lengths, that an almost universal bankruptcy was the result, eventually the occasion of the civil war. The Roman people, therefore, wanted a man who was capable of rectifying such a complication of disorders, and one who was likely to prevent their recurrence in future, by establishing the government upon a new foundation. Such a man was Cæsar.

The patriot Brutus, a patrician, but a fierce republican, seems to have been equally sensible, with the rest of the patricians, of the many opportunities which his order gave him for filling his pockets at the expense of other people; and was accustomed to lend his money, at exorbitant interest, in the provinces, in the manner above-mentioned. The legal rate of interest, throughout the Roman empire, was one per cent. per month, or twelve per cent. per annum. The patricians were, however, in the habit of demanding four per cent. per month, or forty-eight per cent. per annum, with interest upon interest at the end of each month; and Brutus was accustomed to lend his money at this rate of interest, obtaining payment afterwards in the best way he could, by influence or force, as either of these means happened to be most available, through the assistance of his brother patricians, all of whom appear to have been mutually accommodating, and ready to play into the hands of one another.

There are letters extant from Cicero to his intimate friend Atticus, in which the real character of their common friend Brutus is brought to light in the following transaction:—

When Cicero obtained the proconsulship of Cilicia, the first act of his government was to deprive one Scaptius of the prefecture of the island of Cyprus, for surrounding the senate-house of Salamis with troops of horse whilst the senate were sitting, and confining the members within its walls, till five of them actually died of starvation. The excuse made by Scaptius for this horrible act of barbarity was, that the city of Salamis owed him a large sum of money, and that he had resorted to these compulsory measures against the senate as the only way to obtain payment. It seems that Brutus, out of a pretended friendship for Scaptius, took up his cause, and not only made frequent applications to Cicero by letter, to get him reinstated in his prefecture, but en-

treated further of Cicero, that he would use his personal influence, as governor of the province to which Cyprus was attached, to get this money paid to his friend Scaptius. Four per cent. per month, with interest upon interest, in addition to the principal, was the sum claimed in this case; and the usurious and illegal nature of the transaction having been reported by Cicero to Brutus, together with the cruel proceedings of Scaptius, the former was surprised to find that Brutus still continued anxious that his friend Scaptius should be restored to his prefecture, and should be allowed a sufficient body of troops to enable him to obtain the payment of his money. Cicero, however, being unwilling to consent to this, Brutus, in order to prevail upon him, frankly avowed, what he had before concealed, that the whole of the money in question belonged in fact to him, Brutus, and that Scaptius was merely his agent in the business.

From this little story the secret motives, which in reality occasioned the assassination of Cæsar, are easily to be deduced, together with the reasons for its having been so much the fashion in after times to decry Cæsar, and extol the patriotism of Brutus, who headed the band of patrician assassins that murdered him. It was the monied aristocracy of Rome, the Roman stock-exchange, in fact, that murdered Cæsar, who had committed an unpardonable crime in annulling one-fourth of the debts of the community, to relieve the national industry from the thralldom in which it was before held, and whose views for the correction of abuses were so extensive that there was no saying where they would end. Of all the men who ever lived, no one has possessed a more noble and generous nature than Cæsar. Though a patrician by birth, and mixing only in the society of patricians, he entertained no exclusive fondness for the privileges of his order, but, on the contrary, was an enemy to all abuses, and desirous of increasing the general happiness of the whole Roman people, who unanimously recognised him as their friend and protector, and loved him accordingly. Cæsar seems to have united in his own person every quality which has been esteemed most valuable by mankind. He was the consummate general, as well as the polished man of letters; the orator, the historian, the statesman, and the philosopher; equally great in all these characters; having a mind fitted, by its rare combination of energy and prudence, to succeed in every thing he undertook; and to these qualifications he added one, which was perhaps superior to them all, that he was the truly amiable, good, and honourable man, the accomplished and perfect gentleman.—*Bernard's Theory of the Constitution.*

SOCIETY OF FRIENDS.

ENQUIRY is now making by the Society of Friends throughout England as to the average length of life of persons belonging to their society, as compared with that of other individuals. The result is generally highly favourable to the superior longevity of Quakers, but in Chesterfield particularly so, as the following plainly shows; the good effects of living with temperance and frugality could not be more plainly demonstrated. United ages of 100 successive burials in Chesterfield church yard, ending 16th of November, 1834, 2,516 years 6 months, averaging 25 years 2 months, of whom 2 reached the age of 80 and upwards, and 12 reached the age of 70 and upwards. United ages of 100 successive burials of members of the Society of Quakers in Chesterfield monthly meeting, ending 27th of November, 1834, 4,790 years 7 months, averaging 47 years 10 months, of

whom 19 reached the age of 80 years and upwards, and 30 reached the age of 70 years and upwards.—*Derbyshire Courier*.

[Without disputing the correctness of the proposition that temperance is favourable to health and longevity, we must remind our readers that there is a very great fallacy involved in every general report of this nature. The Quakers are what is generally called a respectable body of men; that is to say, men in good circumstances. Few of them are poor; none of them are paupers, or reduced to the level of paupers. They help one another in difficulties like a family of brothers, and therefore they are subject to none of those causes of mortality which swell the amount of our parochial lists, from the lowest and most neglected portion of society. Mortality is much greater amongst the poor than the rich and middle classes. The latter are well fed, well clothed, well housed; the former are subject to all the inclemencies of weather, contagion, and impurities of atmosphere and clothing, and liable to all the variegated and fatal diseases that spring therefrom. We have no doubt that the same difference would be perceived in respect to longevity between the rich or comfortable and the poorer classes, if a distinction were made. This would throw a new light upon the subject, and prove that it was not mere temperance alone that preserved the health and lives of the Quakers, but a sufficiency of those material things from which alone both health and life can proceed, and without which they must immediately decay.]

INDUSTRY AND TALENT.—The celebrated Dr. Carey, Baptist Missionary, died at Serampore on the 9th of June last. He had lived forty years in India, translated the New Testament into upwards of forty Oriental languages or dialects, and into many of these languages the whole of the Bible.

THEOLOGY.—As many who profess to be wise in this world seem not to know the meaning of this word, we shall inform them that its real and literal meaning is neither more nor less than the "Science of Nature;" to be without the knowledge of theology, therefore, is to rank on a level with the brute creation.

NOTICE.

To-morrow Evening, Sunday, 14th, at seven o'clock, Mr. Smith will deliver another demonstrative discourse at 36, Castle-street East, Oxford-market, in which he will give a recapitulation of the first principles of the New Science of the Harmony of Nature.—Admittance free.

CORRESPONDENTS.

We are requested by two of our readers in the country to state our opinion on the duty of man to his neighbour, and on a Church Establishment. The first question may be answered by referring our querists to the golden rule, "Do as you would be done by:" on this one commandment all moral and religious duty hangs; for he who loveth his neighbour loves God—the love of God and the love of our neighbour are one. The nearer we approach to this standard, the better we are. But this love cannot exist in the present state of society. The interests of men are so much divided that they must be rivals. An entire new system of society must be organised before we can keep the moral law; at present we must do our best, and endeavour to destroy the system which causes the evil. As for an Established Church,

no state can be perfect without it; but perfection is only to be accomplished by unanimity. When all men are of one mind about a church, then the church must be a national institution; if men are not agreed, it cannot be national, and the state itself must be divided; for if men are divided in religion, they must be divided in politics, for the first principles of politics and religion are the same. There must always be a church, but it will be of a very different nature from the present. The millennial church will be a system of national instruction, where the wonders and glories of creation and redemption will be explained and illustrated by the assistance of all that is captivating to the eye and the ear; the System of Nature will be illustrated by splendid models, so as to be intelligible to the simplest mind, and the whole plan of Nature, from first to last, will be so clearly demonstrated, that faith will be converted into certainty. The sabbath will be devoted to this great national work of instruction, and the highest intelligence of the land will be employed in superintending it. Hymns and songs of exultation and praise will not be a-wanting. There will be no creeds. Religion will then become a science. The object of prayer being gained, it will not then be used. Jesus Christ is our model for this, and he says, "Now I pray the Father for you, but the time cometh when I shall no more pray the Father for you, for the Father himself loveth you." If you consider Christ as a representative of the church, you may easily discover what the church shall be. These are our answers to our Christian readers, for such we take them to be; and if they hold this hope of the church, it is one which shall never shame them, for universal nature combines with revelation to support it, whilst both refuse their support either to the priest or the infidel. The schoolmaster and public teacher will become the priest's successor. The very name of infidel shall be hunted out of the language.

We shall insert the poem on "Change of Opinion" next week; if we use the liberty the author has granted us of pruning and correcting, it shall be very sparingly, as we seldom, almost never, interfere with other people's modes of expressing their ideas. But our readers must not make us responsible for any doctrine or opinion which is advanced by a Correspondent. To a certain extent we are responsible, for we have no right to introduce any thing that we consider noxious to the human mind; but there are many sentiments and opinions contained within the pages of the Shepherd with which we do not accord. We suffer them to go abroad, and make what impression they can, under the idea that they will excite enquiry, and do no harm; all the leading and anonymous articles are our own; for them we are responsible.

The communication on Astrology was too late to be answered last week. It is a very sensible production, but we have some reluctance to renew the subject so early. If the author is particularly acquainted with the practice of astrology, and could dissect a nativity, we should prefer it to a metaphysical critique of the science, until a few weeks have passed, and then we have no objections to an essay such as the one he has sent us.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 17.]

SATURDAY, DECEMBER 20, 1834.

[Price 1d.]

SYSTEM OF NATURE.

IN our last we identified the first principles of politics and religion, and showed the necessity of combining the two extremes of individual supremacy and universal sovereignty; that is, the union of the power of the whole mass in one individual mind, whether it be the mass of power in a family, a kingdom, a world, or the universe. Without individual control there is no order. We shall now, before we proceed to more minute analyses of natural laws, give our readers a general bird's-eye view of the ultimatum of the progress of society in the establishment of a perfect political system. We shall point out what the Science of Nature foreshows to be the character of the new state of things. We did not mean to bring it forward for a week or two, but some have expressed a desire to hear our opinion upon the subject.

First of all, then, we acknowledge the sovereign power of the people.

But the people, without a leader, are like particles of dust in a whirlwind. There is less mind in the whole people combined than there is in any single individual taken out of the people; i. e. the people would do more good under the government of a fool, than without a governor of any sort. Two or more leaders of equal authority create discord and anarchy. One must be supreme; call him king, emperor, president, prince, or pope,—we care not for names,—one must be supreme.

But as sovereignty resides in the people, the individual who represents the sovereign must be chosen by the people. Of the mode of election we shall not speak at present. This is monarchy and democracy in marriage union.

Second. No parliamentary legislation. It is the very excess of apostasy from order and good government. It is a foolish and extravagant wasting of the time of the nation, and a cockpit for country jockeys, wrangling lawyers, and invidious partizans of whims and theories concerning political and social order, to try their strength, and measure swords with each other; a very useful employment, without doubt, and one from which great national benefit may be derived; but nothing can be more impolitic than to confer the legislative or sovereign power upon a debating society, which, in the very nature of things, must divide itself into two conflicting parties, whose judgments cannot fail to be perverted by the spirit of faction and the love of victory. It is certainly somewhat more intellectual than the ancient mode of deciding controversies by the sword, but the principle is the same, a principle of hostility, and therefore the power should

be withheld from it. Merely take the sovereign and legislative power from parliament, and convert it into an initiatory school for training up experienced and well-informed ministers of public affairs, who, in such a field of conspicuity, on which the eye of the nation would for ever be directed, would approve or disapprove themselves in the estimation of the people, and develop the full powers of their minds, and their various qualifications; and let the legislative and sovereign power be conferred on one individual, eligible to his office as the mayor of a city, with a council of the first intelligence of the land to assist him in his measures, responsible to parliament, and parliament to the people, only as to a court of review; for it is by *review and criticism only* that the people can be exercised; and they have no idea of the irresistibility of such a power in an age of printing, if the sovereign were made a responsible person, and not, as at present, an idol of slaves, in whom it is treason to suppose that any error or evil can be found. "*The king can do no wrong,*" is the present first principle of exclusive monarchy, corresponding to the clerical first principle of "*God is not the author of the evil of Nature;*" but the first principle of *representative monarchy* is, "*The king does all the political right and wrong,*" corresponding to the first principle of the science of Nature, "*God is the author of all Nature, both what we call the good and what we call the evil.*"

But what is the use of the people's representatives? The people's representatives must choose the supreme rulers, the king and council. There is a gradation of power from the people upwards, with a reflex action from the king downwards, the check at the one extremity being a perfect balance to the check at the other extremity. This is our idea of royalty, without which there can be no government; universal suffrage of course is included.

Such is merely a general outline for one country; other countries combining together and forming similar organizations, until at last the whole power of civilized society, and consequently of the world, centres in one individual, i. e. the messiah, or the image of God upon earth, king of kings, and lord of lords. This system will begin with one people, and grow, and grow, like a root in the earth, till it spread over the whole surface. It is Nature that predicts it. You may just as well affirm that an apple-tree will not bring forth apples, as that this consummation will not arrive, and Shiloh be revealed. The Jews, the Christians, and the infidels will then be confounded, and acknowledge what fools they were to imagine it could be otherwise.

The same may be said of villages, towns, and cities, as of individuals: one law of Nature prevails over all—acknowledged and representative sovereignty must reside somewhere. If all towns were of the same size, and of the same importance, there could be no concert of movement either in provinces or kingdoms; for one place would have no more authority than another, and consequently there could be no authority exercised. But a place of authority cannot be a small place. It would be as great an anomaly in Nature to make the sovereignty reside in a small town, as to confer the sovereignty upon a man of small mind, small knowledge, small experience, and small talent. But what has the size of a place to do with talent, &c.? A very great deal; a large city contains more knowledge and experience in the arts of life, and the useful discoveries of science, than a small one. It is a focus of human knowledge; and as every variety of knowledge is useful in government, there is the same necessity for conferring the sovereignty upon the place where the greatest knowledge resides, as for regarding the head as the sovereign of the body. Equality of towns is as impossible in practice as atheism in Nature, or pure democracy in politics—it wants *control*. The law of gradation in authority can never in any case be violated without a violation of the law of order; for order and gradation are one and the same thing.

So far Nature and Scripture conduct us in the plan of a universal representative monarchy. Time and public discussion will elaborate the particulars. But we do not hesitate to affirm that all the useful trades, as they are denominated, must be organized upon a similar principle of *representative monarchy*, but the *fine arts* must be purely atheistic and democratic; that is, each individual must be his own master and his own subject, and lean upon his own resources. Ten tailors may work at one coat, and a hundred bakers at one batch of bread; but two painters cannot work at one picture, two sculptors at one statue, or more than one mind at a poetic composition. The law of Nature upon this subject is as follows:—“*All useful and necessary arts are social by Nature; all imaginative arts are anti-social by Nature.*” Then listen, O men, to your common mother—“Let that be social which is social by Nature, and that be anti-social which is anti-social by Nature.” The great defect of all old philosophy is, that it takes no cognizance of the two extremes of Nature, or utterly discards the one, whilst it receives the other. Now, both are equally necessary and useful; they are a matrimonial couple, bound together in everlasting love; and a disruption of their union is defeat and ruin to those who attempt it. The system which we teach, therefore, is not the unity, but the trinity of Nature; and that involves two extremes; hence we may denominate it “THE SOCIAL AND ANTI-SOCIAL SYSTEM.”

But we have spoken only of the political department; that is only *one* thing. I hate a one; that is unitarianism. Never do—must have another to match it. When God made man, he made him first a unit. Then, says he, reasoning upon the first principles of our philosophy, “It is not good for man to be alone; let us make an helpmate for him:” and he did so—that was mother Church. And he followed the same system in the work of redemption:

for after he had made the Jewish man Church, with its political power, circumcision, beard, law, &c., he was not content till he took out of its side the Christian woman Church, with neither. And now these two worthies, who have fallen from grace, and been deceived by the serpent, are about to bring forth twins—a male and a female—who shall bruise the serpent’s head. Think ye a son is a male only? I tell you, nay; it takes two to make one man. Then we must have the bride, the lamb’s wife,—and that is the intellectual or spiritual department.

And what ought the church to do? Why it ought to teach the people. It ought to instruct them in all that appertains to theology, or the science of Nature; and that comprehends all the sciences, or the first principles of all the sciences harmonized and brought to bear upon the practical departments of politics and morality, or, in other words, public and private morals: for politics are nothing else but public morals. The church, therefore, being a public teacher, ought to teach public and private morals; and as all good instruction is based upon the first principles of Nature, these first principles ought to be taught and illustrated in every variety of ways by which they may captivate and impress the minds of the people. A church, then, is neither more nor less than a system of National Education.

But how can there be a system of National Education whilst men are at variance upon the very first principles of all science; whilst they have not even passed the threshold of the knowledge of good and evil? Impossible! Can a Christian teach a National School? No; he is a sectarian. Can an infidel? No; he is equally sectarian, and inimical to the opposite party. Can a mediator? No; the two parties won’t have a mediator; they want to fight, and fight they shall, like the Irishman’s cats, till they devour one another. Poor humanity! what must they end be?

But, says the infidel, let us have a system of National Education in which no theology is taught. Pray, what is the meaning of this, if it has any meaning at all? Let us imagine such a school—a *liberal school* no doubt! We shall take the history class: no history of the Jews, that touches on theology; no history of the church, that is worse still; no history of Popery, no history of Protestantism, no history of Mahometanism; in other words, no history at all; a perfect sinecure for the master if he has a good salary! “Oh, but,” says an objector, “we should teach them the history of these churches, but no doctrines.” A history of churches, and no doctrines! That is just the same as saying you would feed the children on sheep’s flesh, but give them no mutton. “Oh, but,” you reply, “we might teach them all these things, without impressing their minds with any particular formulas of faith.” Then you would teach them theology; and if you did not, your children would be bigots, as the children of Christians and infidels uniformly are; for they are not taught theology, but positive and negative sectarianism. And, moreover, you cannot impress their minds with any thing, if you teach them every thing. Impression is only made by insidiously and unjustly presenting one set of ideas before them, and excluding others; and this can only be done by a sectarian. A just man, if there be such

a being on the earth, keeps a just balance, for he knows that a false balance is an abomination to the Lord. If you state a case fairly, you have done all that you ought to do. Who can state a case fairly? Neither a priest nor an infidel; for these are the two thieves between whom Christ is crucified.

Charity is the only deliverer the world can ever find; and charity "believeth all things." It will teach that all that has been taught and done hitherto has been right and wrong—right, as part of the great progressive plan of Nature; wrong, because not suited for a permanent system. It will teach that idolatry, Jewism, Christianity, infidelity, are all right in their first or characteristic principles, as opposed to one another, and all egregiously wrong as systems of philosophy; because they have no charity to embrace each other, and are not in accordance with the science of Nature. We shall illustrate this farther hereafter. In the mean time, we affirm that this is the only practicable system of national education out of which a national church will arise; but until men are agreed upon such a system, all efforts to establish "peace and goodwill" are futile. Never can men agree upon politics whilst they disagree upon the first principles of theology, for the first principles of politics and theology are one and the same, and contained in the following proposition, which applies equally to heaven and earth—"The supreme power is the author of all the good and the evil." When this simple proposition is acknowledged in church and state, we shall see around us a happy people, but not till then; notwithstanding it is possible for a party to gather around this principle, and increase with great rapidity of growth, till, like the rod of Aaron, it swallow up all the rods of the magicians.

Thus we have given a general outline of the great system of union to which the progress of Nature is tending, and we leave the particular details at present to be filled up according to the fancy of our readers. Many, no doubt, imagine that centuries must roll on before such a system of unanimity be established. They are no doubt correct, if they speak of its establishment over all the world; but it must begin in one nation first, and that the most enlightened. This we expect very speedily. There are only three countries in the world which can compete for the honour—France, England, and the United States; and it is probable enough that the three will carry on a sort of harmonic movement, the one giving an impulse to the other; but of this we are certain, that the movement in France will prove a failure. England will begin the work after France has attempted it, and America will be her helpmate. A false movement is essentially necessary to set the true movement a-going. Were it not for the false step, we might go on for generations to come, mending, patching, bungling, altering, and murmuring, without any material change for the better. The false step is the crisis which will alarm the whole civilized world, and awaken the mind of every thinking man to the necessity of a systematic reorganization of politics and ecclesiastics. The subject will then be formally laid before the public, and investigated like a question of life and death. Till then we expect nothing but coldness, or the agitation of the popular subjects of the day,

which are all very useful in their place, and preliminary to subjects of more general and overwhelming interest.

THE SHEPHERD.

JULIUS CÆSAR.

(Concluded from our last.)

In the elevation of such a man as this to the supreme power in the state, it must have been evident to the Patricians, that their own privileges were brought into danger, and that it was necessary to get rid of him by some means or other, if they wished to preserve abuses. But it would have been impossible for them to have removed him by fair means, as he was too popular, and had, indeed, too much justice on his side; recourse was therefore had to assassination.

What Cæsar's plans for remodelling the Roman form of government actually were, cannot be determined with any certainty, as he was cut off before he had time for developing them. Still he reigned long enough to give his countrymen a tolerable presage of what was to be expected from him. He showed himself ever indefatigable and vigilant in the administration of justice, enforcing the laws against the rich, as well as the poor, with equal impartiality, strictness, and severity. He was the author moreover of many wise and excellent new laws, for preventing a variety of abuses, and for placing the conduct of men in general on an improved footing; avowing further his intention to collect, abridge, and embody the whole of the Roman laws in a code, for the purpose of rendering the dispensation of justice in future more cheap, ready, and effectual. Perhaps the greatest measure of his reign was that of adjusting the claims of debtor and creditor throughout the empire; which he effected by releasing debtors from all interest upon their debts accrued during the civil war, which amounted in fact to about a fourth of their engagements; a measure rendered absolutely necessary by the circumstances of the case, the national industry having been tied up, and reduced to almost utter ruin through the vast amount of these monied obligations.

By powerful, but salutary remedies like these, he gradually restored order and tranquillity throughout all parts of the Roman world. Even posterity has to thank him for the reformation of the Calendar, as now in use in all Christian countries; a work of general benefit to mankind. The views indeed of this great man were all of the most magnificent description, all calculated to promote the general welfare of the human race. The exact form, however, which he destined the government ultimately to receive, cannot be guessed at, his plans having been interrupted by death, further than that he certainly intended it upon monarchical, and not upon republican principles as before. What we are better informed of is, that after he had vanquished all opposition, and destroyed a most detestable oligarchical tyranny, which passed under the name of a republic, and whilst he was devoting his whole time to the service of his fellow-countrymen, in his endeavours to render them happy, even though he had never given offence to any man by an unkind act, or a harsh word; he was murdered in the midst of his exertions, by a set of persons who belonged to that order which was fattening upon public abuses, and which was most exposed to danger from his reformatory.

The Patricians uniformly spoke of him afterwards as justly slain, and it was natural they should do so. Suetonius, a Patrician historian, calls him, "jure cæsum." It is, however, more strange that the sentiments of these Patricians should have been re-echoed by so many persons in later ages, in defiance of the notorious fact, that

the whole Roman people, with the exception of the Patricians, deplored his loss with bitter and long-continued lamentations, whilst they ultimately revenged his death upon his assassins. But even this will appear less surprising, if we bear in mind the numbers that are to be found profiting by abuses under every form of government, whether monarchical, or republican, all of whom are deeply interested in decrying men like Cæsar, whose views are directed towards the suppression of abuses in general, and whose aim it is to secure the blessings of good government to mankind at large. It is for reasons such as these that Brutus and his coadjutors have been held up to admiration in all ages, as patriots and heroes, whose conduct is worthy of imitation, whilst the noble-minded and virtuous Cæsar is execrated as the *destroyer of the liberties of his country*.

What was however this Roman liberty, concerning which so much has been said, the destruction of which forms so great a blot upon the memory of Cæsar? What was it in fact but a privilege enjoyed by certain favoured classes of dipping their hands with impunity into the pockets of their fellow-countrymen, a liberty in short to plunder? Can any better definition than this be given of Roman, or, it may be asked, even of English liberty? It is easy to see indeed, that the word is altogether *delusive*; for the thing itself can have no possible existence in any good state of society, where every man's liberty is sure to be more and more circumscribed, as people's disposition to plunder one another is checked, and advances are made in social improvement and civilization. Liberty means absence from restraint, but restraints of various descriptions are at all times expedient and advisable to prevent bad men from doing mischief. Liberty and freedom are therefore to be looked upon as figures of speech only, or rather as mere *words of deception* invented by the ruling classes of society, whose interest it is to make other people their prey, for the purpose of benefiting themselves, but as holding out no prospect whatsoever of solid attainable advantage to the people. A show of liberty is an admirable contrivance for screening bad government from observation. Such was probably the real, though not the ostensible object, of the Saturnalia at Rome, a feast established in pretended honour of the god Saturn, wherein masters and slaves mixed together on a footing of equality for a certain number of days in the year, to indulge in riot and debauchery. The same also may be said with equal reason of the encouragement to disorder and drunkenness presented by the Parliamentary elections in England; a license which is very properly supposed to be highly favourable to the preservation of public liberty. The truth, however, is that this liberty, far from being of any good to a nation at large, is a very serious evil. It is never a good except to an individual, who naturally desires to engross all he possibly can himself, and leave no more than he can help to others. What a nation wants is merely to have its government so framed as effectually to prevent either individuals, or classes of individuals, from injuring those who happen to be their inferiors, not only in strength, but in wealth also, as well as intellect and knowledge. People require full and ample protection in these several respects, that harmony and good humour may prevail alike through every gradation of rank; and that Government which fails to provide it, especially on behalf of those who are least able to provide it for themselves, we mean those whose time is wholly taken up in the occupation and toil of daily labour, is essentially deficient in the first requisites for which all governments were originally constituted. Order and discipline are even more necessary for regulating the con-

cerns of a nation, than those of a private establishment; but no one would object to the strictest regulations, in this respect, if the united welfare of the whole nation were the only object aimed at, and if the discipline, however strict, were made to fall equally on all.

A system of *fair play* for every man is the one thing needful to a nation, in order to keep it steady in a course of uninterrupted and lasting prosperity; a system which, by stimulating each person's individual exertions to one single purpose, the increase of his own individual comforts and happiness, without suffering him to trespass upon the enjoyments of another, would lead to a joint increase of the comforts and happiness of all, and would end collectively in the general good.

This, however, would not be *Liberty*, but *Good Government*; which has in no one instance throughout the world been yet obtained.—*Bernard's Theory of the Constitution*.

ON CHANGE OF OPINION.

Lines, addressed to a Friend who had rallied the Author upon the subject.

You seem to think it somewhat strange,
That I should my opinions change:
In this, there can be no surprise,
If men would rightly use their eyes.
Philosophers have changed their minds;
Doctors, divines of various kinds,
Have changed, and changed, and changed again;
Then why should I the same remain?
Nay, do not sacred writers say
That God repenteth of his way?
And 'tis most marvellously strange,
If such repentance be not CHANGE.
And did not Christ in wisdom grow?
A *goodly* CHANGE, we all allow.
I might adduce Peter and Paul,
And holy saints, and martyrs all;
For 'tis no doctrine new, or strange,
That hell's our fate, without a CHANGE;
My Christian friend, then blame not me,
Lest you blame saints, Christ, Deity!

At names so great, and powers so high,
My friend must put his jibing by;
Methinks with such good company,
He also, now, will change like me.

Had I a lib'ral salary got,
And so for money had been bought,
Like pious Christian divines,
Who often go where money shines;
Thousands of these, in Bess's days,
Changed from their popish, wicked ways;
For if the thing they had not done,
Alas! their salaries would have gone!

If I a Radical had been,
Now was an ultra-Tory seen;
Or, having civil life once known,
Had now a brutal savage grown;
Or been a Protestant, but now
Should to a lordly pontiff bow;
Or left the knowledge of the age,
That I might be a druid sage;
Or hobgoblins, and witches, once denied
Received them now—and then my wisdom pride;
I then had sinn'd 'gainst light and knowledge true,
And condemnation just had been my due.
But now, the sun of knowledge shines so bright,
I cannot close my eye-lids on the light.

I may, just now, before my neighbours go ;
 They'll shortly follow, though their pace be slow.
It cannot be, that men for ever must
Prostrate both truth and knowledge in the dust,
Make cruel, ignorant, barbarous ages be
Tests of religious truth, morality.

Bigots, and dolts, may change decry,
 Which may not suit their molish eye;
 They may against apostates rail,
 Till all their spite and malice fail;
 Condemn them here, and rashly tell
 How, when they die, they go to hell:
 Such folly might themselves appal,
 Impeach a Luther, and a Paul.
 Luther from Rome apostatised,
 Paul from those Jewish rites he prized.
 Thus booby drivellers, who impeach
 All that despised apostates teach,
 Make Luther base, as well as Paul,
 And holy writ arraign, and all!
 For all must know, so plain is it,
 Scripture was by apostates writ:
 But ignorance, one may suppose,
 Can nothing see beyond its nose.

In early youth, whilst yet a boy,
 And pleased with every pretty toy,
 I saw our native mountains rise,
 And thought their summits reach'd the skies;
 But, now, I think a boundless space
 Surrounds our earth, and every place,
 And strongest minds in vain may try
 Its utmost limits to decry.
 Thus, too, when young, I should, I thought,
 Believe what reverend preachers taught;
 I thought it impious and profane
 To question what they might maintain;
 Their solemn looks, their serious air,
 Would drive a sceptic to despair:
 Knowledge, experience, and thought,
 Have now a different lesson taught.
 I see that solemn looks, grave affirmation,
 Are not confin'd to any creed or nation.
 A more fallacious test we can't receive,
 Than *sympathy* for what we should believe.

I see that prejudice is strong,
 And very often leads us wrong.
 Would we for truth alone then stand,
 We ought to search on ev'ry hand;
 Nor say, that *sacred books* must be
 From ev'ry fault and error free.
 Heathens, Mahometans, and Jews,
 Have *sacred books*, which they peruse;
 Them they revere as much as we
 Our *Holy Writ*, our Deity;
 And mufti, priests, and holy brahmins, rage
 If any sceptic doubt their sacred page;
 And, orthodox as modern preachers, tell
 That a vile unbeliever's fate is hell.
 Heathens, and Jews, and Turks, to hell we send;
 They to those fiendish powers us recommend.
 Thus they return our pious compliment,
 And thus our species *ALL* to hell are sent.
 This is religious, pious *etiquette*;
 Diaused, alas, how would the giddy fret!
 Lament how sceptical the times were grown!
 How lax, such sacred doctrines to disown!
 Ye wicked Jews, and Turks, and Heathens, fie,
 CHRISTIANS to banish from the joys on high!
 "Ye Christian dogs, ye Infidels profane!
 Blasphemers of our HOLY PROPHET's name!

Rejecting Mahomet, the prophet true,
 Hell, and its hottest regions, are your due;"
 Thus Islam's son, with pious zeal replies,
 And "God is merciful," he ever cries.

Now, when these various sects have sent
 A world to endless punishment,
 They outrage common sense, and say
 Theirs, only theirs, is the right way.
 That each, alone, to God can bring
 Glory, to men goodwill they sing.

Whilst ignorant divines thus madly rave,
 Bigots applaud, with looks zealous and grave,
 And think that all the sceptic race are blind,
 Not to perceive God's love to all mankind.
 What boundless love, what matchless, wond'rous grace,
 To send seven hundred millions of our race—
 Yea, more than these, of each successive age,
 Where fiends in liquid fire for ever rage!
 Alas, that Satan thus should take our race,
 Despite the Saviour's love, the Father's grace!
 But how can saints their numbers proudly boast,
 With nineteen out of ev'ry twenty lost?
 If numbers can decide, or merit tell,
 The victory is for Satan and for hell.

Such monstrous doctrines, once I thought
 By far too sacred to be brought
 T'agree with what pure reason taught;
 KNOWLEDGE and REASON, now, alone,
 I would as my preceptors own;
 To them I would allegiance pay,
 Whatever SACRED BOOKS may say;
 Secure upon these rocks I stand,
 Nor heed the empty bigot band;
 Nor those with prejudice allied,
 Though fill'd with grave and saintly pride.
 There's nought but faith, our preachers say,
 Can place us in the heavenly way;
 We must believe, or we must go
 To hopeless, never-ending woe.
 This all the preachers of the land
 State as the great divine command.
 We're also taught this saving grace
 Is God's own gift unto our race;

Then, till he gives it, there's no doubt
 We certainly must be without;
 But when this gift divine he gives,
 The poorest, vilest sinner lives.
 Alas! that God should always careful be,
 And give this heavenly boon so sparingly!
 Oh! that he had the charity and love
 That do the hearts of modern preachers move!
 They would from none withhold the precious boon;
 Thus conquering Satan's mighty empire soon.
 Had but our preachers *power*, they are so civil,
 They'd rescue every sinner from the devil;
 Their ardent zeal, their prowess who can tell?
 They'd kill the devil, and storm the gates of hell:
 Oh! that the Deity had half their zeal,
 Satan would stand aghast at human weal!

Poor Hottentots can show a better way
 Than all the learned preachers of our day:
 When Missionary Kay spoke with a chief,
 The latter ask'd the cause of unbelief;
 The former said, "Undoubtedly, the devil—
 Who is the source and cause of every evil."
 The chief replied, "Convert the devil first,
 And then you'll readily convert the rest.
 When, finally, you make the devil a saint,
 You free the world from every evil taint;

All men will then flock to the Christian fold,
Nor can their ceaseless numbers e'er be told."
Could we, but now, a sacred book indite,
God's attributes should shine more purely bright;
He should as kindly as his creatures be,
Nor punish ONE to all eternity.

The sect the best informed, the most humane,†
Have banish'd Satan from his own domain;
They treat him with unkindness, and with rigour,
And say he's nothing but an evil figure:
Eternal punishment they too disown;
A barb'rous doctrine, light has overthrown.
A modern sacred book, if one could be,
Would draw a more impartial Deity;
Yes, one who could a better plan devise
Than what divines so warmly eulogise;
Nor punish men for what their sires have done,
After some thousand tedious years are gone;
Nor make their destiny in future time
Rest on their FAITH—not INNOCENCE or CRIME;
Nor punish pure, unsullied innocence,
That guilt escape the fate of its offence;
Nor boast benevolence and saving grace,
Whilst perish nearly all the human race.

Without a change, dear Sir, both you and I
Had worshipp'd THOR, unshelter'd from the sky,
Or unto ODEN brought our infant race
T' assuage his wrath, or gain his valued grace;
We had in woods and dreary forests ranged,
From all we now deem comforts quite estranged.

Suppose I then had visited my friend,
Unto some cheerless cave our steps we bend;
Gloomy, and damp, and dismal is the place,—
The meagre fare just suited to the case.

If to the west I now should chance to roam,
I see a handsome mansion is his home;
A beauteous garden opens to the view,
With grateful fruits, and flowers of many a hue:
There stately tulips, dazzling to behold;
Here, splendid dahlias their leaves unfold:
Carnations, pinks, ranunculuses try
With other beauteous sister-flowers to vie;
Good spacious walks divide this Eden fair,
And mingled sweets, diffused, perfume the air.

We enter, now, the goodly mansion's door,
And handsome carpets ornament each floor;
The furniture, by skilful artists made,
From costly woods of richest hue and shade;
The tasteful artist here his skill has shown,
Nor portraits their originals disown;
Here, he who owns the mansion fills a place—
His beauteous lady there appears with grace.
Kindly our friend invites us to his cheer,
And handsome China services appear;
And luxuries from India, West and East,
Are deem'd essential to a casual feast.
These now withdrawn, the hospitable board
Is crown'd with dainties southern lands afford;
The sparkling goblets now in turn advance,
Fill'd with the wines of Portugal or France.

I'm changed, my friend; I'll visit you no more
In gloomy caverns, and with viands poor.

Written in a mountainous district in Lancashire, 1834. J. L.

* In the seventeenth century, Dr. Scott presents us with the following picture of the Christian world, which is not very inapplicable to the present period:—

"The professors of religion are crumbled into many sects and parties, each spitting fire and damnation at its

adversary; so that, if all say true, or indeed any two of them in five hundred sects, which there are in the world, (and, for aught I know, there may be five thousand,) it is five hundred to one but that every one is damned; because every one damns all but itself, and itself is damned by four hundred and ninety-nine; so that it is a mighty chance if, in so great a volley of anathemas, which every one hath levelled at it, any one escapes."—*Christian Life*.

† The Unitarians.

CHARACTER OF POPES.

HISTORY solemnly declares, that no set of men have been more frequently distinguished by personal vices, by a recklessness of profligacy, and by an excess of depravity.

Pope John XXIV. was a heretic. Pope Eugenius was convicted by the Council of Basil both of schism and heresy. Pope Anastasius was excommunicated by the Roman clergy for being a heretic. Pope Liberius turned Arian. Pope Honorius was a Monothelite. Pope Marcellinus sacrificed to idols. Pope John XII. drank the health of the devil, who some time after, however, (in the shape of the husband of a Roman lady with whom he was caught in bed,) knocked him on the head. Pope John XXII. denied the immortality of the soul. So many popes of voluptuous character have filled the chair, that it would be tedious to name them. Pope Formosus got the chair by perjury. The popes distinguished as cheats have been Alexander III., Boniface VIII., Celestine V., and Benedict X. Pope Boniface imprisoned his infallible predecessor, and plucked out his eyes. Pope Sergius III. caused another pope's body to be dug out of its grave, and the head to be cut off and flung into the Tiber. Popes Damascus II., Victor II. and III., Celestine IV., and Paul III., were poisoners. Popes Pius IV., Gregory VII., Stephen VIII., Sixtus V., Gregory XIV., and Honorius II., were murderers.

But let us look more particularly to such acts of two or three individuals, as we can collect from the scanty authority within our reach.

Balthazar Cossa, cardinal deacon, entirely governed Alexander V., who died when he had held the chair a few months. Cardinal Baptista Panætius of Ferrara, however, says, that Balthazar caused him to be poisoned by Marsilius of Parma, his physician, whom he bribed thereto with a large sum of money, in order that he himself might succeed him in the papacy.

The manner in which he did succeed him is curious enough.—As soon, it seems, as Alexander was dead, Balthazar, having contrived by his former administration to secure considerable power, requested the cardinals to elect such a pope as he might approve. They at first proposed several, all of whom he thought unfit. At last, they asked him plainly to indicate to them one whom he approved. "Give me then," said he, "the cloak of St. Peter, (which is thrown upon the newly-elected pope,) and I will give it to him that shall be pope." This being done, he clapped it on his own shoulders, saying, *Papa ego sum* (I am pope). Several of the cardinals, it is said, grumbled; but none dared to oppose him. He, therefore, succeeded by the title of John XXIV.

He, soon after, summoned a council at Rome, where occurred an odd accident, related by Nicholas Clemangis, as follows:—"At the first meeting of the council, mass being said after the accustomed manner, to invoke the Holy Ghost, no sooner was the council sat, and Balthazar in a chair provided for him higher than the rest, than an ill-favoured screech-owl, (the presage, they say, of calamity,) with a horrible scream, flew over their heads, and

seated itself upon the middle beam of the church, with its eyes directly fixed upon the pope.—‘Behold,’ said one of the licentious Italian wits—‘behold the Spirit in the form of an owl!’—Balthazar seeing how the owl glared at him, first blushed for shame,—then began to perspire,—and by and by, in confusion, broke up the council. At the second session, the owl was there again in the same manner, and the pope would have driven it away by noise and clamour, but it would not stir, till, being attacked with staves, and having received several blows, it fell down dead before them all.”

When the wickedness of this pope could be borne no longer, a charge was made against him, extending to fifty-four articles, and including murders, poisonings, sacrilege, heresy, tyranny, simony, infidelity, atheism, &c.; and in that charge, he is styled a devil incarnate (*diabolus incarnatus*). It was, it seems, in particular, proved, that he was frequently guilty of adultery, had ravished several virgins, and had committed incest with nuns; that he had caused pope Alexander to be poisoned, to enable him to usurp the papacy; that he had sold many lands of the church’s patrimony, nay, even churches themselves in the city of Rome, as well as their holy relics; (for example, he had nearly sold a head of St. John Baptist for 50,000 ducats!) that he had conferred benefices and ecclesiastical charges upon his bastards when not above five years old; and that, to fill up the measure of his wickedness, he had affirmed that “there is no life eternal,” or future existence after this life; nay, he believed that “the soul of man dies and is extinct, together with the body, after the manner of beasts;” and had declared, that, “being once dead, even in the last day, there should be no resurrection.”

These and many similar things were fully proved against him; and John himself assented to and ratified, “of his own certain knowledge,” the sentence in which they were enumerated. Yet his successor made him a bishop, a cardinal, and dean of the sacred college, and gave him place next to himself in all public ceremonies.

Of Paul III., as to private character, we are assured that nothing “could be more superlatively wicked.” In the reign of Innocent VIII. he poisoned his own mother, and a nephew, that all the inheritance might fall to him. When a candidate for the purple hat, he was thrice rejected by the college; and it was his sister Julia, pope Alexander VI.’s mistress, who prevailed with the latter to thrust him in among them. He poisoned another sister; and Quercy, husband of Laura, his niece, caught him in bed with her, and gave him a wound, of which he bore the mark to his death. He frequently cohabited with his daughter Constantia; and, that he might more freely enjoy her, poisoned her husband, who began to perceive their unnatural connexion. He exceeded Commodus and Heliogabalus in licentiousness, as too plainly appeared in relation to his sister and daughter, and the great number of bastards he had,” &c.

As to public character, Paul was, it seems, accused (besides the more common or private crimes!) of trafficking in church livings, squandering away the revenues of his see, advancing his bastards and relations, selling Modena and Rhegio, and alienating Parma and Placenza; of amassing vast sums, by tyranny and all manner of oppression, that, by a profusion of wealth, he might satiate his nieces and the other women of his family; of raising extraordinary subsidies, imposing new customs, and exacting the tenths, nay, sometimes a moiety, of the fruits of the earth; of holding a secret correspondence with the Turks, notwithstanding his seeming zeal to make war against them; and of many other crimes.

On Paul’s death, however, his body lay three days in

state, in the chapel of pope Sixtus, whither the people flocked to kiss his feet, which, according to custom, were put out at an iron grate!

Such have been many of that succession of monsters, whom papists regard as the infallible representatives of God on earth.—It is not, therefore, much to be wondered, that even Polydore Virgil, though a servant of the pope, as collector of Peter-pence in England, should say, “The bishop of Rome has the peculiar privilege, that, when once created bishop of that see, he may change his name at his pleasure: for example, if he have been a malefactor, he may call himself Bonifacius, or well-doer; if he have been a coward, he may call himself Leo; if he be a clown, he may call himself Urbanus; if he be lewd or wicked, he may call himself Pius or Innocent; if he be a scandalous fellow, he may assume the appellation of Benedictus;—to the end that the sovereign bishop may, at least in name, be an ornament and honour to the dignity of the papacy.”—*Reformer’s Library*.

[Now all this is in perfect character with the representative of God upon earth in the old world, or first Christianity; for who is the God of this world, but the devil, and who is first christianity but antichrist? Popery is all as it should have been, and the pope himself quite infallible, for he managed things exactly as the original plan required—infallible in mischief; and his system, and all systems resembling it, shall most infallibly perish.]

PARABLE OF SAINT SIMON.

THE following is the celebrated Parable of St. Simon, published in Paris in 1819, for which he was prosecuted for high treason by the French Attorney-General, and acquitted by a jury of Frenchmen. We give it as translated and published by Dr. De Prati.

Let us suppose that France, on a sudden, loses her 50 best natural philosophers, her 50 best chemists, her 50 best physiologists, her 50 best mathematicians, her 50 best poets, her 50 best painters, her 50 best sculptors, her 50 best musicians, her 50 best men of letters; her 50 best mechanical geniuses, her 50 best civil and military engineers, her 50 best artillery engineers, her 50 best architects, her 50 best physicians, her 50 best surgeons, her 50 best apothecaries, her 50 best nautical men, her 50 best clockmakers; her 50 best bankers, her 200 first merchants, her 50 first agriculturalists, her 50 best forge-masters, her 50 best gun-makers, her 50 best tanners, her 50 best dyers, her 50 best miners, her 50 best cloth-manufacturers, her 50 best cotton-manufacturers, her 50 best silk-manufacturers, her 50 best linen-manufacturers, her 50 best hardwaremen, her 50 best china and delft manufacturers, her 50 best glass and crystal blowers, her 50 best armourers, her 50 best coach and van proprietors, her 50 best printers, her 50 best engravers, her 50 best goldsmiths, and other workers in metals; her 50 best masons, her 50 best carpenters, her 50 best upholsterers, her 50 best smiths, her 50 best lock-makers, her 50 best cutlers, her 50 best brass-founders, and the hundreds of other men of different trades not enumerated, who are of superior capacity in the sciences, the fine arts, and the mechanical handicrafts, making in all the three thousand best scientific men, artists and artisans, in France.

As these are the most essentially productive classes of the French, those who furnish the most important products, who direct the works most beneficial to the nation, and who make their country productive in the sciences, the fine arts, and the crafts, they are in truth the flower of French society; of all the French, they are the most useful to their country, and those who insure it the most

glory, who best promote its civilization as well as prosperity. The nation would become a body without a soul in the moment in which it lost them: it would immediately sink into a state of inferiority compared to the nations which it now rivals, and it would continue to subside into a lower grade in respect to them, so long as it should not have repaired its loss—so long as a new head should not have shot upwards. It would require at least one generation in France to make up this calamity; for men who distinguish themselves in works of positive utility are real anomalies, and nature is not prodigal of anomalies, particularly of this class.

Let us pass on to another supposition. Let us admit that France retains all the men of genius whom she possesses in the sciences, in the fine arts, and in the crafts, but that she have the misfortune to lose, upon the same day, his Royal Highness the King's brother, his Grace the Duke of Angoulême, his Grace the Duke of Berry, his Grace the Duke of Orleans, his Grace the Duke of Bourbon, her Royal Highness the Duchess of Angoulême, the Duchess of Berry, the Duchess of Orleans, the Duchess of Bourbon, and the Princess of Condé! That she loses, at the same moment, all the great Officers of the Crown, all the Ministers of State, with or without a station in the Cabinet, all the Privy Council, all the Masters of Requests, all her Field-Marsals, all her Cardinals, her Archbishops, Bishops, Grand-vicars, and Prebendaries, all her Prefects and Sub-prefects, all placemen in office, all the Judges, and, over and above these, the ten thousand richest landlords among those who live in splendour.

Such an accident would certainly afflict the French, because they are a kindly people, and could not behold with indifference the sudden disappearance of so great a number of their countrymen. But this loss of thirty thousand individuals, reputed to be the highest in the State, would cause them no other sorrow than a purely sentimental one, for no political misfortune would result to the state from it.

In the first place, it would be very easy to fill up the situations which would have thereby become vacant: there is a great number of Frenchmen fit to discharge the functions of Brother to the King, as well as his Royal Highness; many are capable of filling the places of Princes, just as suitably as his Grace of Angoulême, his Grace of Orleans, his Grace of Bourbon; many French women would be just as good princesses as her Grace of Angoulême, their Graces of Berry, and her Grace of Orleans, of Bourbon, and of Condé.

The anti-chambers of the Palace are full of courtiers, ready to take the situations of great officers of the Crown; the army contains a vast number of officers, who would make as good generals as our present field-marsals. How many subordinate clerks are there, who are the equals of our Ministers of State! how many men of business more competent to manage properly the affairs of the Departments, than the prefects and sub-prefects now in office! how many barristers quite as sound lawyers as our actual judges! how many curates as able as our cardinals, our archbishops, bishops, grand-vicars, and prebendaries! As to the ten thousand landlords living grandly, their heirs would not require any apprenticeship to do the honours of their houses as well as they.

The prosperity of France cannot but depend upon the progress of the sciences, fine arts, and industries, and be in proportion to them: now, princes, great officers of the crown, bishops, field-marsals, prefects, and idle land-owners, do not work in a direct manner at the advancement of the sciences, the fine arts, and the arts of industry. Far from lending aid to them, they labour to prolong the

predominance hitherto given to conjectural theories over positive knowledge. They necessarily impede the prosperity of the nation, by depriving, as they do, the learned, the artist, and the artisans, of the first degree of consideration, which justly belongs to them; they impede it, because they lay out their pecuniary means in a way not directly useful to the sciences, the fine arts, and industry; they impede it, because they drain annually from the taxes paid by the people a sum of three or four hundred millions of francs, by way of appointments, pensions, perquisites, indemnities for their labours, which are of no use to the people.

These suppositions throw light upon the most important fact of existing politics; they elevate one to the point of view whence this fact is seen in all its proportions at a single glance; they prove clearly, though in an indirect way, that our social organization is far from being perfected; that men still allow themselves to be cheated of their dues by fraud and violence; and that, politically speaking, the human race is still plunged in immorality.

Since the learned, the artist, and the artisans, who are the only men whose labours are of a positive use to society, and who cost but little, are lorded over by princes and other rulers, who are mere men of routine, with more or less incapacity; since the dispensers of honours and other national rewards, are, in general, indebted for the preponderance which they have, only to the chance of birth, to flattery, intrigue, or less estimable conduct;

Since those who are entrusted with the administration of public matters, divide among themselves yearly one half of the taxes, and do not spend a third of the contributions, (which they do not even collect in person,) towards the object of promoting the interests of the tax payers;

These suppositions show, that our present society is verily the world turned upside down;

Because the nation has admitted as a fundamental principle, that the poor should be generous towards the rich; and in consequence the worst off daily deprive themselves of a portion of their necessities, to augment the superfluities of the large land owners;

Because the greatest culprits, the wholesale robbers, those who press down the bulk of our citizens, and despoil them of from three to four hundred millions of francs per year, are commissioned to award punishment upon the minor transgressions of society;

Because ignorance, superstition, idleness, and a taste for costly pleasures, form the portion of the supreme directors of society; and because the talented, the saving, and the industrious, are only employed in a subaltern capacity as mere tools:

Because, in short, in all kinds of employment, it is the incapable who are set to direct the capable; because, in regard to morals, it is the most immoral who are called to train our citizens to virtue, and because, in respect to distributive justice, it is the mighty villains who are raised up to pass sentence upon the trespasses of the lesser delinquents.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

NOTICE.—A learned Friend and Correspondent has promised us a series of Letters on Animal Magnetism, with the first of which we hope to present our readers next week. W. Wilnot will be answered next week.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

The Shepherd.

SATURDAY, DECEMBER 27, 1834.

[Price 1d.]

SYSTEM OF NATURE.

We have already, in separate articles, pointed out the positive and negative morality of religion—and we observed, that the one was adapted for the new world, the other for the old; that there was a morality for old Christianity, and a morality for new Christianity, both contained within the pages of the same book. We were obliged to be brief and concise upon this subject, for our little work will not admit of much lengthened discussion. We shall treat the doctrines in a similar manner, only we shall bring the positive and negative forward together.

First, then, we are told that God is not the author of evil—that he is “a God of truth, and without iniquity; just and right is he;” that his spirit strives against evil, and is grieved by evil, and is an enemy to evil. This is a positive doctrine, and is the first principle of all the ecclesiastics of this evil world. In opposition to this we are told—that God is the author of both the good and the evil—“I make peace, and create evil; I, the Lord, do all these things.” Isa. xlv. 7. “He sends lying spirits to deceive men,” 1 Kings xxii. 39—“strong delusions, that they may believe a lie,” 1 Thessa. ii. 11. “He hardens men’s hearts, and makes them obstinate that he may destroy them,” Deut. ii. 30. “He causes men to hate and deceive each other,” Psalm cv. 25. In other words, he does *all things*. This is the contrary extreme of the doctrine of the priests, and is taught in the Book. The priests say the Devil does all these evil things. Then, pray, who is the Devil? Compare 2 Sam. xxiv. 1, with 1 Chron. xxi. 1, and you may make a shrewd guess. The first says, “The anger of the Lord was kindled against David, and he (*the Lord*) moved David to number the people,” &c. The second, speaking of the very same circumstance, says, “And *Satan* provoked David to number the people,” &c. Both are one. This exactly corresponds with the Science of Nature, which divides Nature into two extremes—yet these extremes are one, although diametrically opposite. Nothing is more opposed to love than hatred, yet one mind contains them both. God and Devil are the two extremes of Nature, which it is now the business of men to regard as one mind. The Bible, therefore, is the joint production of both, and is strictly correct when it says God is not the author of evil, and equally correct when it says he is the author of evil. For if you call one of the two extremes God, then he only does one half of the work—the Devil does the other; but if you call the two extremes God, then God does all the work. Now, the old world gives the name of God to one extreme only—

hence it always maintains that God does the good only; and, as men differ in their ideas of good, they consequently quarrel about what is divine, and what is not divine—what is God’s will, and what is not God’s will; but in the second stage of the world, the time of Reformation, men will unite the two extremes, and regard all Nature as God. Then God will be the author of every thing that takes place; and men will never quarrel about God’s will, but merely consult their own and each other’s happiness—knowing, that whatever is done in Nature, must of necessity be the will of God. It is by this simple trick of dividing the two extremes, and representing Satan and God as two distinct beings, instead of two principles in one supreme nature, that the grand system of spiritual division has been kept up. It is admirably managed in the Bible—a cloud is thrown over the truth, and yet the truth is let out very frequently, and is abundantly manifest to those who have been initiated into the secret. No art of individual man could have done it; it is beyond all the craft and subtilty of the highest wisdom of an individual. It is a species of inspiration which is decidedly different from reason, but by no means superior to it, as the priests say. On the contrary, vision and prophecy are the lowest grades of mental inspiration, as they are not the result of individual knowledge and exercise of mind, but merely impressions, somewhat analogous to instinct in animals, caused by involuntary movements, such as the dreams and visions of sleep, which are not voluntary exercises of mind, but produced by a cause unsearchable. Religion arises from this visionary source—but it is the province of reason to judge and arrange the Sybil-leaves which are thus scattered in profusion from the wild shrubbery of Nature; hence it is written, “Know ye not that ye shall judge angels?” Judgment is given to man; he is not to follow blindly, like a slave; but to think, like a son. Evil reigns until man dares to be a JUDGE of what he has hitherto feared to approach.

With this solution of the riddle—which applies to all other religions as well as Christianity—the contradictions of the Bible, and of mysticism in general, become perfectly intelligible. Thus, for instance, it seems very ridiculous in the Lord, after giving the law to Moses, and specifying so many particulars respecting burnt offerings and sacrifices, to say to the prophet Jeremiah, after speaking contemptuously of those very ordinances, “I spake *not* unto your fathers, nor commanded them in the day that I brought them out of the land of Egypt, concerning burnt-offerings and sacrifices;” and after speaking so highly in favour of the law which he gave to

Moses, to say, "I gave them statutes which were *not* good, and judgments by which a man could *not* live." Ezek. xx. 25. But this is in perfect accordance with the Science of Nature, and the action of the two opposite extremes in hostility, until man, by experience and the exercise of judgment, attains to a knowledge of good and evil. Were this opposition not kept up for a considerable time, the human mind could not be exercised—man could not possibly be a rational being. No man, surely, can be so silly as to affirm that mankind could acquire knowledge without *strife*. It is a law of Nature—and being a law of Nature, why should it not be a law of the Bible, which is the book of Nature? But the strife is over when you have discovered the elementary principles of the Science of Nature.

When God gave the law to man, the Serpent, the opposite extreme, immediately opposed it. The spirit of law said, "Do this;" the spirit of liberty said, "Do it not." These are both good principles. Law is necessary to order; and even a foolish law is better than none, for it trains the mind to regularity and self-control, *or liberty*; but the spirit of disobedience is indispensable—for the law which is suitable for one period of life, is not suitable for another. As man advances in knowledge, he becomes discontented with the fetters to which he was reconciled in ignorance; this discontentment produces disobedience and rebellion; and by the spirit of disobedience the law is changed, and suited to the progress of the mind. Were it not for the spirit of rebellion, law would remain the same for ever. The spirit of rebellion is the spirit of the Serpent, or knowledge; the Serpent is the wisdom of God; by listening to the Serpent, man got wisdom, and the Serpent will finally conduct him to the haven of rest. He meets with much evil by the way, however, for he has the law to combat. Were it not for the law, he would run wild into excess; the law is a check, but a check which always yields, as man acquires knowledge to resist it; it will fly before us, gradually diminishing in power, in the same proportion as we acquire knowledge. Without the Lord to give a law, we should run mad—without the Serpent to prompt us to rebel, we should become stagnant for ever; the Lord and the Serpent, therefore, are our two instructors. But it said the Serpent, the Devil, shall be destroyed, his head shall be bruised. Most assuredly; for the time shall come when the spirit of rebellion shall die. Good laws shall at length prevail, and the voice of the tempter shall be comparatively heard no more. But shall we abuse the Serpent for his temptations? Without these temptations, we should never have progressed to redemption and intellectual union. No; "Satan himself is transformed into an angel of light." All evil is temporary by nature, and is converted into ultimate and everlasting good. The Devil (that is, the evil) is cast into the lake of fire and brimstone—ever burning, and never consumed, because evil is infinite; as we destroy one species, another of a minor order appears; and we go on decreasing and destroying to eternity, but never done. It is an everlasting victory of good over evil—eternal punishment to the one, everlasting glory to the other. What a splendid system it is! how sublime and consistent in all its parts,

and how confounding to all the absurdities of priests and infidels, who talk of these glorious subjects without the slightest comprehension of them—the one making them monstrous with cruelty and injustice—the other, in ignorance, identifying them with the doctrine of the priests, and treating them with scorn!

The positive and negative are seen in every doctrine. Thus faith and works have divided the church in all ages. One says justification by faith; the other, justification by works; the former is called the evangelical, and is the characteristic doctrine of St. Paul; the second is the doctrine of the Church of Rome. It would be well if people, before they contended such points, would first define their terms. What is faith? Can a man have faith in God without faith in man? No! "He that saith he loveth God, and loveth not his brother, is a liar;" and he who says he believes in God, and believeth not his brother, is a liar also; "for if he love not his brother whom he hath seen, how can he love God whom he hath not seen?" And if he believe not his brother whom he hath seen, how can he believe God whom he hath not seen? But the Christian says he believes God *through* his servants. And who are his servants? *The prophets*. Then do you believe in Mahomet? *No*, says the Christian. Do you believe in Emanuel Swedenborg? *No*, says the Christian. Do you believe in Joanna Southcote? *No*, says the Christian. Then you do not believe in God; you are an infidel. But the Christian replies, "I believe in Jesus Christ." Which of the Jesus Christs do you believe in? There are three Jesus Christs. There is a Jesus Christ who was crucified on Mount Calvary by the priests; and there is a Jesus Christ who is, or is to be, "formed in us, the hope of glory"—a spiritual Christ, who never leaves the church, and who is still hanging on the cross between two thieves, who reject and revile him; and there is a Jesus Christ, who is the church itself: "Ye are the body of Christ, and members in particular." Which of these three Christs do you believe in? *I trust I believe in them all*, says the Christian. Then why don't you believe in Joanna Southcote, or Emanuel Swedenborg, or in popery, or any other sectarianism, which are all members of the visible church, or the body of Christ, who said that his spirit would continue in the church to the end of the world? You have no faith, Sir; you are an impostor: for faith is charity, and charity believeth all things to be from God. When men have faith in God, they have faith in one another; and when they have faith in one another, will not the world be saved? Where then will the infidels be, when all men have faith? And when men have faith in one another, will not good works follow? What is faith but good manners; and what are good works but the same? Justification by faith, and justification by works, are one and the same—but the simpletons do not see the trick of the Serpent. [We speak entirely of this life, for the sake of infidels. We do not allude to the other; but as the analogies of Nature are perfect, what is true of the one is true of the other. Our Christian readers may therefore apply the argument for themselves. There is no salvation for this old man of the old world; for "there is no faith on the earth;" it is the new man only that can be saved; the curse is upon the other—he is an infidel.]

By taking their stand upon one side of a proposition, and opposing the other, division has been perpetuated, hatred excited, and cruelty committed, all for the love of God and the good of mankind, as the parties imagined; or by adopting the limited sense of a proposition, and rejecting the general sense, the same division follows. Thus the church takes only one of the three Christs for its standard; and in perfect harmony with its own bigoted views, it takes the most limited—the image, the idol, the individual and particular man, who is the representative of the universal spirit of the church; and it rejects the universal spirit of truth itself, who is crucified by the Gentiles as his model was crucified by the Jews. Little do they know that the death of Christ in Jerusalem was but a type of the crucifixion of truth in the church by the priests and the infidels. What was the Jewish church but a church of types, from the sacrifice of beasts to the sacrifice of man? there was no substance in it, no good resulting from blood-letting: the true blood is the principle of action, the intellectual life: red blood is merely the animal life, the type of the other. The true sacrifice for sin, then, is the intellectual blood of the old world—that is the principle of error: when this blood is shed, man shall be really and literally saved. For as Christ had two natures, a human and divine, so has the church; and as Christ's human nature was destroyed, and afterwards glorified, so also is the fate of the church: it must die—it must be crucified between the believer and the infidel, who shall die along with it; and as the one thief cursed him as he died, and the other thief pitied him, so also shall it be in the original—the infidel shall revile the church as it dies, and the believer shall pity it, and pray to be partaker of its glory. When it revives, he shall be partaker, and so shall the other; for both are equal in error and guilt, and both shall enjoy the benefit of reformation; they shall no more be two parties, but one. Therefore paradise is promised to one only; i.e. to FAITH; for by faith alone can the world be saved; but it must be catholic, or universal, faith.

Thus it appears that Christ is not yet dead. The church is Christ, and there can be no salvation until it be destroyed. "Crucify it, crucify it!" for there is immortality within it—it will rise again; it will die in corruption, it will be raised in incorruption. "Verily, verily, I say unto you, unless a grain of wheat fall into the earth and die, it abideth alone; but if it die it bringeth forth much fruit." The Jews are right; they rejected Christ because he did not bring deliverance; but neither party knew that Christ was the whole church, and not an individual only. The Christians were right in receiving him, for he was the founder of the Messiah Church, which must be crucified before the world be saved. The Christians received the founder, and mistook him for the whole substance, and the only saviour. The Jews reject the founder until he has finished his work, and his body be complete. They are both wrong; and in process of time they will shake hands as brothers, and acknowledge that all was right, and that it was a crafty old serpent, who played a long, long cunning trick upon them, which all the wisdom of this world could not discover; and yet it is so very simple that a child may understand it.

If these things be not so, pray what is the use of telling us that Christ is the "lamb slain from the beginning of the world?" or of St. Paul teaching the Colossians (i. 24.) that the sufferings of Christ were not yet completed, inasmuch as they were going on in him and other suffering members of the church. The whole mystery is evident enough, that Jesus Christ is merely the individual representative of the church, as the king of Britain or of France is the representative of his country. Thus we say France does so and so, merely when the king is doing it; and so we say Christ does that which the church alone can do. And what can it do? Why, it can save the world, after its human or corrupt nature is crucified, for there is a living spirit of reformation within it. It is the Christian church which is the Messiah, not the man Christ alone, who is merely the founder, or first man Adam of the church—the root of the tree. The Christian church is the king of churches, as the Messiah is the king of kings. But the Messiah can never save the world until he die for its sins. It is only after the Messiah is cut off that he will make an end of sin, for his first nature is an evil nature; according to the everlasting law of God, the first shall be last, and the last first.

It is this individualism which leads men astray upon all the fundamental doctrines of politics and religion—the conferring upon an individual the titles, attributes, and honours which belong to the whole race. This leads them astray on the subject of monarchy, in teaching them to ascribe a divine right to a particular person or family, instead of investing the sovereignty in the whole people, with an elective representative. It corresponds minutely with religion: the same error has led men to regard the single person of Christ as the whole Messiah and sacrifice for sins, and peculiarly sacred, like the king's person; whilst the church itself is accounted nothing—a mere blank. The order must be totally reversed—the individual must come to nothing, and the mass must be set up. The mass is God—the individual is man, and the worship of the individual is idolatry; but the worship of the mass is the worship of God, who speaks, thinks, and acts in each and all.

Christ then is the whole mass of the people; and as the typical Christ said to his followers, "my body is broken for you," so is the great Christ broken and divided into ten thousand fragments, sects, and parties, to be united again in the day of redemption. "He that scattereth Israel shall gather him again;" the very same name that has divided them shall collect them. There is no other name by which they can be saved; for that name has already obtained the greatest political, ecclesiastical, and literary power, such as no other name can rival; and therefore, like a sun amidst minor bodies, its superior attractive influence will whirl them all around it. Rivalry is now out of the question; more especially as we can now rally all the sciences, and all the knowledge of nature, in support of New Christianity, to the confusion of all sectarianism and every system of exclusive salvation, or infidel negation.

The priests have erred, and all believers have erred, but they have erred innocently. They know no better; they invented no system; systems have grown in the

course of ages ; and the priests have been as frequently tools of the people as the people of the priests. It was all in accordance with the system or plan of Nature, who divides herself into two stages of error and truth ; she has built the old world up with erroneous conceptions, according to her everlasting rule of action, and in pursuance of the same everlasting rule, she will, with the greatest simplicity, remove the veil from the human mind, and show men the truth much nearer than they imagined. "The word is nigh thee, even in thy mouth," only it is a parable at present ; but the days of parables are about to close for ever ; nevertheless, they cannot close till all the great parables of Nature are expounded : he who expects to get rid of them otherwise is no philosopher—he is a mere simpleton.

It is evident from these observations, that the proposition "Jesus Christ is the Messiah" is both true and not true. He is the Messiah, inasmuch as he founded the Messiah Church, which contains, in the midst of a corrupt nature, the elements of a perfect system, which must be established when the corrupt nature is destroyed, as its founder was ; and he is not the Messiah, inasmuch as he is the beginning of a work of evil, which was not to bring to peace, but a sword ; not to gather, but to scatter. The Jews are still right in this respect at least, and the Gentiles are right in another ; and the infidels are right in abusing the past system as a work of iniquity. But all the three are blind to its real meaning and tendency.

THE SHEPHERD.

ASTRONOMY.

BEING requested by a correspondent to illustrate in a simple and intelligible manner the process by which we come to a knowledge of the distance of the heavenly bodies, as very great ignorance, and consequently doubt, prevails in the popular mind upon that interesting subject, which demonstration alone can remove: we shall adopt the plainest and simplest mode of illustration which at present occurs to us.

It is by means of trigonometry, or the science of triangles, that all these discoveries are made. There are two kinds of trigonometry—spherical and plane. The latter deals in straight lines, is very simple, and will suit our purpose most satisfactorily. An angle is the divergence of two straight lines from a point, thus:

The angle is always measured by degrees of a circle, never by feet or inches, as a straight line is. A circle has always 360 degrees, whether it be a large circle or a small circle. Now suppose one leg of the compasses placed on the point of the angle, and the other drawing a circle through the lines round about the point ; then, in order to measure the angle, you divide your circle into 360 parts, and measure how many of these parts or degrees your angle consists of, and that is the size of your angle. The fourth part of a circle is always 90 degrees, and is called a right angle, less than 90 is an acute, greater than 90 an obtuse—three kinds in all.

When you have a triangle to measure, therefore, you must measure the degrees of the angles before you can proceed to work, and you must have the length of one of the sides given, because the length of the sides makes no difference in the degrees of the angle. You might extend these two lines to one of the fixed stars, and the angle remain the same in size, about 30 degrees, or the third part of a quadrant ; but if you have one of the sides given, and the angles, you can easily find out the other sides by simple proportion—as the size of any angle is to the length of its opposite side, so is the size of any other angle to its opposite side.

There is one thing which the reader must take for granted at present, namely, that every triangle, of whatever shape it be, contains the same number of degrees in its three angles ; the three united are always 180—if then two angles are given, the third is found by subtracting the two from 180. Now a right angle is always 90, and is made by two lines perpendicular to each other ; every perpendicular line, therefore, makes a right angle with the line it stands on. A house makes a right angle with the ground. The corners of a book are right angles. Now the *Shepherd* has four corners, each of these is 90 degrees, in all 360. But suppose you divide it from corner to corner, you make two triangles of it, of 180 each. If then a triangle has a right angle, and one of the acute angles be given, subtract that one from 90, and you get the other. Apply this now to practice. I want to know the height of the London Monument. I measure a certain distance from it, say one hundred feet ; this is one side of a triangle ; then I take the angle of the top of the Monument with a quadrant, an instrument for the purpose ; and having done so, I make my calculation.

As the angle at the top (which is what the angle of the quadrant wants of 90) is to 100 feet, so is the acute angle of the quadrant to the height of the Monument. The truth of this calculation may be determined by a plumb-line from the Monument. It is infallible. We can demonstrate it by actual measurement on earth a thousand ways. All the difficulty, therefore, in applying it to the heavens, is to find a base, or one side of the triangle, and one of the angles. The base which is generally taken is the semi-diameter of the earth, or the length of a line from the centre of the earth to the circumference: this in round numbers we shall call 4,000 miles. Now we must find the angle of the heavenly body, and here is all the difficulty. This angle is called the parallax ; and if you can find the parallax, you find the distance, with only a short calculation with your pencil. If the moon was attached to the earth like the top of the Monument, it would be easy to measure it, for we would do it as we did the Monument ; but we must scheme a little to supply this deficiency.

The earth is spherical, and as objects retreat from the eye they disappear, going downwards towards another hemisphere. Thus at sea a ship's hull disappears before

the mast, and at last merely the mast-head is visible. So it is with mountains, and the higher the mountain, the longer it keeps in sight. Suppose in a dark evening a large globe of fire above your head, one mile high, moving round the earth in twenty-four hours like the heavenly bodies, that is, one thousand miles an hour; being only one mile from you, it would disappear almost instantly, down, like the ship's masts, behind the curve of the earth; were it ten miles high, it would take longer time; 1,000 miles high, longer still; 240,000, like the Moon, longer still; 95,000,000, like the Sun, longer still; as far off as the stars, still longer. It is by comparing these movements that we find the parallax.

The Earth revolves on its axis in 24 hours, and it causes all the heavenly bodies to appear to revolve. Now if the Moon revolves the whole circle in 24, she ought to revolve one half in 12. Suppose, then, she rises vertical due east, and sets due west, she ought to take 12 hours exactly to describe one half of her circuit; but one half of her circuit is as low as the centre of the earth, and we lose sight of her at the horizon; she must therefore take less than 12 hours.

What she wants of 12 hours is double the parallax, or angle at the moon (M), made by drawing two lines from the moon to the spectator and the centre of the earth; or, which is the same thing, the small angle at the centre (C) made by drawing one line to the moon on the horizon, and another line (co) parallel to the horizon on a level with the centre of the earth. Having got this angle, which is nearly a degree, we find that the moon is 60 semidiameters of the earth from us. The sun would have a smaller parallax, because it is farther off; and you find that the farther off you go, the smaller the angle at the centre becomes, so that at the fixed stars it is so small that it seems to touch the lower horizontal line; hence it follows, that as the parallax of the fixed stars is immeasurably small, so that a base of 4,000 miles cannot make a visible divergence of the two lines of the angle, we have an undoubted right to conclude that the stars are immeasurably distant. The moon's parallax is 56 minutes, 42 seconds; the sun's is only a few seconds. The figure illustrates the parallax of both sun and moon.

It is evident, in looking at the figure, that the nearer an object is to the earth, the smaller is the number of degrees of a circle which it describes between rising and setting. Take your pencil, and draw two or more circles at different distances around the circle representing the earth, and you will find that the farther off you go, the larger the arc becomes, and the nearer it approaches to a semicircle; you may draw one so near that between the two horizons there are not 5 degrees, another has 10,

another 100, another 170, another 179, another 179 and a fraction; it never can be 180, because the horizontal line is not so low as the centre. It is evident, then, that the greater the distance of a heavenly body, the longer it is above the horizon; therefore supposing the sun, moon, and a star, to set off from the same spot, the moon would set first, the sun would set next, and the star next.

There are other methods of calculation besides this. This is so simple, that the distance of the moon was guessed by Pythagoras two thousand years ago. Our instruments are now so very accurate, that we can measure the thousandth, the millionth part of an inch, and the thousandth part of a degree would be no great difficulty. But with all this nicety we cannot measure the parallax of a star. We cannot even measure its annual parallax with a base of two hundred millions of miles, for we are in June two hundred millions of miles distant from the place where we are in December. Yet this immense base of a triangle is such a hair-breadth compared to their distance, that it won't make an angle so large that our delicate instruments can measure it. Could we get the parallax, the difficulty is all over; the mode of calculation is certain and infallible. But still we are justified in saying, that billions, trillions, and nonillions of miles must be the result of the measurement when it is accomplished.

What a splendid idea this gives of Nature's immensity! How marvellous are all her works! in wisdom and power she has made, and superintends them all! What is impossible to her? What puny fools are they who call in question her power and intelligence! Philosophic grubs, indeed, who are a blight upon the intellect and literature of the age, but not worse than they who make a monster of that power divine, in whose tranquil bosom all these orbs revolve, from whose eternal fountain of life their inhabitants all derive their being. Gloomy and inconclusive also must that mind be that can contemplate this sublime scene, and not anticipate final good as the result of all its movements. Good is order and harmony; it reigns supreme. Evil is disorder and discord; it is evidently subordinate, a mere servant to the other. Its existence is temporary; it is made for destruction, ordained to be a victim. Progress is upward to perfection. Why then should mortals indulge in gloomy suicidal philosophy, or extinguish that lamp of hope which Nature herself has kindled? They who do so will always be a wandering shepherdless flock, seeking rest and finding none, with the mark of Cain and the Beast upon their forehead.

When the distance of the sun is determined, the distance of the planets is easily obtained; for when they are at their greatest elongation, they form a right-angled triangle with the sun and us, the right angle being at the sun. We therefore measure the number of degrees between the sun and planet, and thus we find all the angles and one of the sides; the other two sides are easily found. There are many ways besides this, however, and when all bear testimony to each other's accuracy, the evidence is complete. In such immense distances, if we should err even a million of miles it would be but a trifle, only one eighteen-hundredth part of the distance of Uranus.

We were also requested to explain how a pound of lead

should weigh heavier in Saturn than on Earth. Upon the same principle as a large magnet attracts with greater power than a small. Saturn is a much more powerful magnet than our earth, and as a strong man will lift a weight with greater rapidity than a weak man, so a strong planet will attract with greater power and rapidity than a weak one. We judge of the strength of Saturn by his size; but we have not sufficient evidence to prove that the material, and solidity, and attractive power can be determined from the size; therefore we can only determine the exact weight of a pound in Saturn, by *supposing* that his power is in exact proportion to his bulk. We do not find it exactly so in nature, not even in magnets, but nearly so.

We must remind our readers that the calculations of which we have spoken are made by logarithmic tables, which reduce the degrees of a circle to the standard of a straight line; without these it would be very tedious work, for a mile and a degree are two very different things.

FOOD.

THE food of all animals consists either of vegetables or animals, or of both. The stomachs of most animals are adapted to the digestion of one of these kinds only: the stomachs of a small number of species are fitted for the reception of both animal and vegetable food, in which is included the human species. Man may support himself, like beasts of prey, by means of flesh alone. The greater part of the population of our globe derive their subsistence from vegetables; a considerable portion of this population lives on a mixture of vegetables and animals, but a very inconsiderable part of the world live on animals only. It is very difficult to ascertain which of these three modes of subsistence is most conducive to the health and strength of man; because those nations which differ from one another in the article of food, always differ from one another in a variety of other important circumstances. There appear to be sufficient grounds for believing a simple vegetable diet to be superior to a diet compounded of vegetables and animals. The English nation may be taken as an example of people using a mixed diet. The Hindoos and Chinese are examples of people living on a simple vegetable diet; to these may be added the African Indians, who live on maize, or Indian corn. There are no grounds for believing the Hindoos and Chinese inferior to the English in health and strength: the African Indians are confessedly stronger than Europeans. Without going so far from home, the Irish people afford us good demonstration, that men living on vegetables only are as strong as men living partly on vegetable and partly on animal food; for it is well known that an Irishman's day's labour far exceeds that of an Englishman. Although a man's health or strength is not much affected by the kind of food which he is accustomed to consume, yet he cannot suddenly change his food without greatly endangering his health. Sudden changes in physics and in morals are equally to be avoided.

With relation to bodily health and strength, it is a matter of little importance whether a nation subsists on flesh or vegetables, or on a mixture of flesh and vegeta-

bles: but with relation to happiness, the mode of subsistence is a matter of the greatest moment. The number of people a certain quantity of land will sustain, when producing vegetable food, is ten or twenty times as great as the number which could be maintained by the same land employed in pasturing cattle. The strength of a nation is in general proportional to its population: the nation living on animal food would therefore fall an easy prey to the bordering agricultural nation, possessing an equal extent of territory, and the pasturing nation will thus lose its liberty and happiness. But the designs of Providence are blindly fulfilled by man;—men always act by instinct, never by calculation. No nation ever increased its population in order to increase its powers. The conversion of a pastoral into an agricultural nation, was never grounded on a calculation proving the advantages of such a change. It is the instinctive desire of having children which is constantly operating in the transmutation of pastoral into agricultural nations. Men love rather to change their food than to be without children: it is a greater pleasure to them, to live on vegetables and have children, than to live on flesh and have no children, which is the alternative presented by nature. Some people are of opinion, that the habitual eating of flesh is a great addition to the happiness of man; but others, with more reason, think, that an Indian sits down to his rice with as much pleasure as an Englishman does to his round of beef—the one, certain of rising up with reinvigorated powers and light spirits, the other, having a good prospect of a long hour of heaviness and languor, with the chance of an indigestion.

There are three kinds of food on which man may subsist, viz. flesh, seeds, and roots. As it is manifestly of the greatest importance to know which of these three kinds of food is the best for man, I shall proceed to set before my readers the relations they bear to one another. I intend, in the first place, to show what proportions of nourishment a given quantity of land will yield, according as it produces flesh, seeds, or roots: in the next place, I shall endeavour to show what proportions of nourishment can be raised by a given quantity of labour, according as it is bestowed on the production of cattle, seeds, or roots. To obtain a precise knowledge of the quantity of each kind of food which is requisite to maintain a single man, or a certain population, in good health, experiments must be undertaken on a large scale. To obtain a knowledge of the average produce of a given quantity of land and of a given quantity of labour in a country such as England, there must be a general national return of all the lands in culture, of their produce, and of the labour expended on them. In the absence of such experiments and such returns, we must trust to the observation of individuals for an approximation to these averages. However, the result of the observations of individuals will serve all useful purposes nearly as well as the results of the most correct national returns. There does not exist any great difference of opinion, among men best acquainted with the subjects, respecting the above-mentioned averages. The following assumptions, it is expected, will be found midway between the highest and lowest averages commonly assumed.

I will first assume that two pounds of meat nourish as much as three pounds of wheat, or four pounds of barley, or five pounds of oats, or ten pounds of potatoes. In the next place, I will assume the average annual produce of an acre of land to be one hundred and forty pounds of flesh, or twenty-four bushels of wheat, or thirty-two bushels of barley, or forty bushels of oats, or two hundred and fifty bushels of potatoes (exclusive of seed); or by weight, the net produce of an acre of land to be one of the following:—meat 140 lbs.; wheat 1440 lbs.; barley 1600 lbs.; oats 2000 lbs.; potatoes 17,500 lbs.; hence the proportion of people maintained by each acre will be:—in meat 70; wheat 480; barley 400; oats 400; potatoes 1750; and since three pounds of wheat may be regarded as a fair daily allowance for a full-grown man, the last numbers will represent the number of days such a man can live on an acre producing these different kinds of food. The last numbers also show, that an acre of wheat, barley, or oats, possesses nearly equal powers of nourishing. We may say, generally, that an acre of land in animal food will sustain a man *seventy days*; an acre in corn will sustain him *four hundred and twenty days*; and an acre of potatoes *one thousand six hundred and eighty days*: that is, the quantities of nourishment supplied by an acre in cattle, corn, and potatoes, will be as the numbers *one, six, and twenty-four*, respectively. In other words, a given territory in corn will maintain *six* times as large a population as the same territory would in pasture; and a given territory in potatoes will maintain *four* times as many people as the same territory would in corn.—*Edmonds's Practical Moral and Political Economy.*

(To be concluded in our next.)

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER I.

DEAR SHEPHERD,—The Science of Nature is but a fragment, if it does not comprehend and embrace all the forms and shapes under which that mysterious power, which is the life and the light, reveals itself to the attentive eye of the observer. I know that it is your ardent wish to concentrate within *one* great focus the different modes of intellectual perception; and it is merely the universality to which you aim, that gives me the opportunity of presenting some ideas upon a subject, which at first sight must startle a great many of our contemporaries, who, immured as it were in the catacomb of partial systems, think every thing a folly which does not agree with the assumed infallibility of their puny notions.

However, in order to be perfectly understood, I shall present, under the shape of axioms, some general propositions, the truth of which must be evident to every one who is desirous to lend his attention to the philosophy of Nature.

1. All objects in the universe are living and organic. They appear in the movement of time, and in the formation of space.

2. Time and space are neither the attributes of the objects, nor mere mentalities; but necessary relations between the body and the mind.

3. Because objects are existing, they must exist at some time, and must occupy some space. The existence in time is comprehended by the mind, as the relation of succession; the co-existence in space gives to the mind

the relation of co-existence. What exists in time can be calculated by the higher mathematics, under the form of fluxion. The relation of coexistence gives birth to geometry, trigonometry.

4. All objects which appear in time and space may be considered, in relation to the universe, as integral, organic parts of Nature; considered singly, they must be considered as living organic beings, endowed with greater or less independence.

5. Consequently, all objects of Nature have a twofold relation; first, to the whole of which they are part—secondly, to themselves as individuals. The relation of individuals to themselves is manifested by the law of self-preservation.

6. When the living beings (objects) come in contact, there arises, according to the law of individual self-preservation, a living action and reaction—each of the two wishing to preserve itself, endeavours to destroy or overpower the other. When this occurs, the only possible results are either assimilation of one thing with the other—that is, the formation of a new organic being, (as, for instance, water is formed by oxygen and hydrogen,) or there arises a new process of life, in which the two organic beings stand to each other in the relation of polarity; the most powerful assuming the form of positive = +, the other the form of negative = —.

7. But, since nothing in the world stands insulated, or by itself, but is always in relation to other beings, consequently in continual action and reaction, the polar relations are to be found both in the largest and smallest circles of life; so much so, that polarity may be regarded as the fundamental law of the universe. Hence arises the phenomenon of general and particular sympathies.

8. If we pay attention to the planetary system, we shall find the sun acting as the positive pole, = +, forcing the planets to form the movements around its centre; the planetary life, on the contrary, appears as the negative pole, = —, and its result is the double movement of the planet around the Sun and around its own axis.

9. But life and rest are contradictions; every thing in time and space is moving; but this motion is not continually increasing, nor continually decreasing, but alternately increasing and decreasing. This gives to the activity of life an oscillatory form. So, for instance, the solar power is at its summit at the epoch of perihelion, and the tellurian power is predominant in aphelion. The same oscillation is evident in the rotation of the earth around its axis; the day being the expression of the solar life; the night, on the contrary, the expression of the earthly (telluric) life.

10. A similar oscillation of polar life is also constantly to be traced in all the individual objects of the earth, since being part of the whole they must be subjected to the general law. If, for instance, we examine an animal or a human being in the relation of time, we see the continual oscillation of + and —, and progress of development and regress of development; the two organic stages of life are similar to the two organic stages of nature, summer and winter, manhood and old age. If we consider them in the relation of space, or as organic beings, the male appears as the positive, +, the female as the negative, —; yes, the sensitive system is the positive, +, the vegetative the negative, —. Even among the nerves, the muscles, the veins and the arteries, the lungs and the heart, the same relation of polarity is undeniable.

11. All objects of the earth being subjected, as parts of the whole, to the law of polarity, must be classed under a solar or telluric relation.

THE ALPINE PHILOSOPHER.

MATERNAL AFFECTION OF THE BEAR.

EARLY in the morning, the man at the mast head gave notice that three bears were making their way very fast over the ice, and directing their course towards the ship. They had probably been invited by the blubber of a sea-horse, which the men had set on fire, and which was burning on the ice at the time of their approach. They proved to be a she-bear and her two cubs; but the cubs were nearly as large as the dam. They ran eagerly to the fire, and drew out from the flames part of the flesh of the sea-horse, which remained unconsumed, and ate it voraciously. The crew from the ship threw great pieces of the flesh, which they had still left, upon the ice, which the old bear carried away singly, laid every piece before her cubs, and dividing them, gave each a share, reserving but a small portion for herself. As she was carrying away the last piece, they levelled their muskets at the cubs, and shot them both dead; and in her retreat, they wounded the dam, but not mortally.

It would have drawn tears of pity from any but unfeeling minds, to have marked the affectionate concern manifested by this poor beast, in the last moments of her expiring young. Though she was sorely wounded, and could but just crawl to the place where they lay, she carried the lump of flesh she had fetched away, as she had done the others before, tore it in pieces, and laid it down before them: and when she saw that they refused to eat, she laid her paws first upon one, and then upon the other, and endeavoured to raise them up. All this while it was piteous to hear her moan. When she found she could not stir them, she went off, and when at some distance, looked back and moaned; and that not availing to entice them away, she returned, and smelling around them, began to lick their wounds. She went off a second time as before; and having crawled a few paces, looked again behind her, and for some time stood moaning. But still her cubs not rising to follow her, she returned to them again, and with signs of inexpressible fondness went round first one and then the other, pawing them, and moaning. Finding at last that they were cold and lifeless, she raised her head towards the ship, and growled her resentment at the murderers; which they returned with a volley of musket balls. She fell between her cubs, and died licking their wounds.—*Scoresby's Voyage to Greenland.*

The following extraordinary example of somnambulism is mentioned by Dr. Abercrombie as an established fact:—A girl, aged seven years, an orphan, of the lowest rank, residing in the house of a farmer, by whom she was employed in attending cattle, was accustomed to sleep in an apartment separated by a very thin partition from one which was frequently occupied by an itinerant fiddler. This person was a musician of very considerable skill, and often spent a part of the night in performing pieces of a refined description, but his performance was not taken notice of by the child, except as a disagreeable noise. After a residence of six months in this family she fell into bad health, and was removed to the house of a benevolent lady, where, on her recovery, the most beautiful music was often heard in the house during the night, which excited no small interest and wonder in the family, and many a waking hour was spent in endeavours to discover the invisible minstrel. At length the sound was traced to the sleeping-room of the girl, who was found fast asleep, but uttering from her lips a sound exactly resembling the sweetest sound of a small violin. On further observation it was found, that after being

about two hours in bed, she became restless, and began to mutter to herself. She then uttered sounds precisely resembling the tuning of a violin, and at length, after some prelude, dashed off into elaborate pieces of music, which she performed in a clear and accurate manner, and with a sound exactly resembling the most delicate modulations of that instrument. During the performance she sometimes stopped, made the sound of re-tuning her instrument, and then began exactly where she had stopped in the most correct manner. These paroxysms occurred at regular intervals, varying from one to fourteen, or even twenty nights, and they were generally followed by a degree of fever and pain over various parts of the body.

CORRESPONDENCE.

A correspondent of the old Christian school enquires, how is it possible that the God and Devil of Scripture can be two principles of one common mind, when the Lord and his servants are always cautioning us to beware of the Devil? Let him read our System of Nature this week. Does not love caution us to beware of hatred, and hatred of love? Are they not enemies to each other? Both devils, when misdirected? To love evil is the devil, to hate good is the devil. We ask the Christian enquirer, which of the two extremes it was who inspired the prophets and apostles? If he says love, then we nail him, for the love of evil is the Devil. If he says hatred, then we nail him still; for hatred of good is the devil. But if he says both HATRED and LOVE inspired the prophets, then he is of our own school, and we call him brother. You cannot talk rationally without adopting this principle of twofold action. It is by this that Nature progresses, one extreme rising while another is falling, so that the action and reaction of God and Devil are eternal. Evil is the discord of their action, good is the concord; and this latter is the same to us as the destruction of the Devil, though not literally so.

Another is dubious about two extremes: he thinks there are sometimes more, as east, west, north, and south. This is a bull. East and west are one pair of extremes, and north and south another pair. All Nature is arranged in pairs; hence God made man and brutes in his own image, male and female, two extremes.

Another is afraid of despotism without a parliament. We shall reply to this more fully hereafter; in the mean time, we are more afraid of despotism with a parliament. We are always afraid of many masters, and in our own experience we have always found that committees and public assemblies are only fit for talking, not for real business. What could an army do, led by a council of officers? Consultation would destroy the genius of all, for it throws a man off his own resources, and makes him inconclusive or insipid in thought. There is no genius in number. Genius dwells in unity alone. One general is better than fifty, and one legislator is better than a thousand. But more of this hereafter. Do not misunderstand us. Don't be hasty. We don't mean a dictator, but a dictator dictated, both active and passive, male and female.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trogate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Brady, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 19.]

SATURDAY, JANUARY 3, 1835.

[Price 1d.]

SYSTEM OF NATURE.

OUR last article has caused several to think deeply on a new subject. To all parties the doctrine is new, to the Christian and to the infidel. They have never been accustomed to reason upon this twofold principle. The instructors of the old world have taught them to reason upon one principle only, and they have hopped along, each and all of them, like a man upon one leg. They have looked with one eye, and heard with one ear, and walked with one leg, all along; the infidel, lame and defective, on one side, and the vulgar believer on the other, each accusing the other of lameness, blindness, and deafness, without being able to perceive his own defect. There never was an infidel who opposed the Bible, up to this very day, but opposed it upon the principle that God could *not* be the author of evil, or in other words, of Nature. What a foolish outset! Why, it is the priests' own sanctuary, and as long as this article of faith is acknowledged by priests and infidels, we shall never want fanatics of both sorts; and, in our estimation, there is not much difference between the two species.

One Christian (of the old school) acknowledges to us that it is a dilemma we have brought him into, but still cannot see why a good God should, could, or would be the author of evil. He could not be a God at all if he was not, for what is God but "*every thing*?" But since there is a difficulty in conceiving this splendid truth, we shall address ourselves to the task of illustrating the subject more closely, and we shall lay it down in the following proposition:

EVIL is the LAW of GOD.

A few evenings ago we were sitting in a friend's house, with a little boy of about two years old upon our knee. There was a burning candle upon the table, which we brought close to the child, and desired him to put his finger into the flame, by showing him the example, (a very wicked thing, wasn't it?) he did so, and drew it back instantly, laughing, but giving symptoms, by the drawing of his breath through half-closed lips, that it was a dangerous experiment. We urged him to try it again; he did so, but much more cautiously, and kept at a considerable distance, and no entreaty could prevail upon him to go so near the flame as he had done at first; he had been slightly burned, this produced *fear*, and fear produced *prudence*. We saw the whole process of Nature in that little act, and we immediately quoted the celebrated words of the Bible—"The fear of the Lord is the beginning of wisdom."

This little story is but a sample of what is taking

place with men, women, and children, beasts, birds, and fishes, every moment of time. The *fear of evil* is always upon them, and by that fear of evil they are directed and controlled. "But," say the *pious* Christian and *rational* infidel, "what is the use of evil? there could be no use for fear, if there was no evil to fear." Oh thou of little faith! is nature so ill constructed that God's good intentions are defeated by the designs of an intruder on his infinite domains, and in opposition to his infinite power? and thou of little reason, to imagine that living beings could act without evil, or the prudence and system which it alone can create! their movements would be a scene of dreadful confusion and uproar. Let us imagine a world without evil—Paradise, before our rebellious mother ate the apple! No evil, say you? *no*. Then of course a child could never hurt itself by falling? *no*. It could have no fear upon it? *no*. Then how could it learn to walk? *why Nature would teach it*. Nature, you simpleton! What is Nature? Is it not fear? By abstracting fear from Nature you take away the teacher, for it is fear that teaches the child to walk; he takes hold of chairs and stools, and he holds out his arms to balance himself, and he hobbles and totters, and thinks most intensely; his whole mind is absorbed by the act of acquiring experience in balancing himself, and the fear is the cause of it all; for he knows well enough that if he fall he will hurt himself. Take away the evil of pain, and the fear of pain, and the child would become a fool; it would run into the fire, it would tumble down stairs, it would leap out at the window; no danger. Men would do the same; they would not put themselves to the trouble of walking down stairs, they would fling themselves down from the top of the house; no danger. Caution would be out of the question, for what is the use of caution where no fear is? and order and prudence would be out of the question; for what is the use of order, when no evil arises from disorder? In fine, without evil, where could good be found? for good is nothing but a selection from *general* nature, of what suits our *particular* nature. What does not suit us we fear, because it produces evil. This fear creates caution, prudence, experience, knowledge, reason, wisdom, &c. These intellectual virtues, therefore, could have no existence without evil. Evil, then, is the school of Nature, and the *fear of evil* is the beginning of wisdom. It is a law which attends us through life; a perfect law, which we love to obey, because in the keeping of it there is great reward. Apply this reasoning to the following texts from Scripture, "Fear the Lord, and depart from evil." "By the fear of the Lord men depart from evil." "It shall be

well with them that fear God." "Blessed is every one that feareth the Lord."

It is evident enough, then, that we have demonstrated the truth of the proposition, "Evil is the law of God." Now we have got another proposition to match it, for ones are insufferable. That other is "Good is the gospel of God," or the glad tidings. There are no glad tidings in the law, for it tells the little child that he will burn his fingers in the flame, that he will hurt his little bones, and bruise his tender flesh, if he fall. All this is quite *fearful*; nothing but pain, pain, pain. It is like the giving of the law from Mount Sinai—blackness, darkness, tempest, fire and brimstone, threatening, frowning, scolding, &c. All very bad news for the little fellow. But the cunning little stripling is all the better for it; he learns to walk, learns the use and abuse of fire, water, food, and all the other objects of nature; he learns prudence, wisdom, design, ingenuity, &c. But the gospel is quite another thing. The gospel says, "Here, my little fellow, here are good news for you, here is a sugar-plum." His little eyes sparkle with joy, he jumps, exults, and almost forgets his schoolmaster, the law; if he does forget the law of the Lord, down he falls plump upon the floor, his nose bleeds, he screams, cries, and waters his cheeks with his tears. "Now try it again, my dear; but do not forget the law of the Lord; let the fear of the Lord be upon thee, my love." Off he goes, hobble, hobble, hobble; there, he has it; he has got the sugar-plum. And how did he get the sugar-plum? By the experience of evil and good—the good stimulated him to act, and the evil directed him how to act with prudence and system.

Evil and good, then, or the law and the gospel, are the two teachers of mankind, the two extremes; the one acts by fear, and the other by love. Hence St. Paul very beautifully calls the law a *schoolmaster*, to bring us to Christ, or to liberty, or the gospel, or the sugar-plum. And what was it that brought the child to the sugar-plum, but the law, the fear of evil?

What a false and irrational foundation, then, is that of the whole mental, moral, and religious philosophy of this world, which refuses to acknowledge God as the *LAW-GIVER* of Nature, by saying "he is not the author of evil!" If he is not the author of evil, he cannot be the author of the law, for evil is the law itself. "The law was given," says an apostle, "that offences might abound; that where sin abounded, grace might much more abound;" in other words, evil was created, that by the fear of evil, and the discretion which results from it, man might arrive to greater happiness: for the greater the experience of evil, the greater the mental improvement which the schoolmaster has effected.

"But then," say our Christian and infidel philosophers, "if evil is good, why destroy it?" In other words, if the pain of a fall or a bruise be of service in teaching a child to walk with caution, why try to prevent falls and bruises. It is not the experience or actual suffering of evil that is good; it is the fear of evil only that is good; but if the evil were not there, there would be no fear. It is the fear of the magistrate that is good, not the actual employment of the magistrate; the less employ-

ment he has the better, for the *fear* is quite enough to a prudent mind. When society is so arranged that the fear of the law will be sufficient to deter from offending, then political evil will be destroyed; but fear won't be destroyed, for the law will still exist, the schoolmaster will hold up the rod, but he shall never have occasion to apply it to the breach. This is the perfection of government, the reduction of the law to a spirit of "fear" so powerful as to prevent all political offences, and do away with the office of magistrate. This is the perfection of fear—sacred, intellectual, moral, *HOLY FEAR*.

This holy fear, however, is of a very different nature from the fear of the priests. Priestly fear is the slavish fear of a monster called God, which tortures inexpressibly for ever and ever the poor creatures whose passions, misfortunes, or privations, have tempted them to commit a few outrages or venial offences, or whose peculiar modes of thinking have taught them to reject certain clerical propositions. Such is not holy fear; it is diabolical fear, which makes men monsters by setting a divine example of monstrosity before them. This fear is not the fear which teaches wisdom, but the fear which maintains superstition and priestly corruption, from all which fear and its revolting consequences, the good Lord deliver us! It is because the priests don't know who the Lord is that they are ignorant of what the fear of God is. If they knew that God is Nature, they might understand what it means; but being ignorant of this most important fundamental article of faith, they make the fear of God the slavish fear of a tyrant, instead of the useful principle of the fear of evil, which is the guide of our feet, and the lamp of our understandings.

"But," the pious Christian replies, "allowing that God is the immediate author of physical evil, are we to infer from this that he is the cause of moral evil?" What is the difference between the two? Moral evil is nothing at all, if it be not the *cause* of physical evil; what evil can there be in stealing, if stealing does harm to no one? What evil can there be in knocking a man down, if it does him no harm? What evil is there in cutting a man's throat, if it does not injure him? We determine the amount of moral evil merely by the amount of physical evil which it causes. They are merely cause and effect; moral evil always creates physical evil; and the cause which brings physical evil into being is moral evil. If God, therefore, creates physical evil, he himself is moral evil. "But," says the pious Christian, "you surely would not accuse God of committing murder, theft, &c." My dear Christian, does not your Bible say that "the Lord giveth and the Lord taketh away." The Lord is taking away life daily in ten thousand different ways; some of these very cruel, and hard to be borne; some die of cancers, others of imposthumes, fevers, plagues, bruises, broken limbs, consumptions, privations, and all sorts of lingering trouble, pining away many weary days, weeks, months, and years, in the greatest anguish and misery. All this is the work of the Lord, and you acknowledge it; yet your priestly prejudices cause you to startle when, in addition to these numerous modes of taking away life which the Lord employs, we

add that of the knife of the assassin, or the poison of the more scientific murderer, which are much more speedy and merciful in their operation. Surely, your wits have gone out in search of another master, when you talk so inconsiderately as to ascribe a greater evil to God, but shudder at the idea of ascribing a less.

Your reply I anticipate:—"The diseases of human nature are the consequences of human folly; they are a tax upon immorality, and prevent men from going into excess by the fear of evil." Very good; but will not the same reasoning apply to human society, which is the MAN UNIVERSAL, or species? Are not the murders, the thefts, and the robberies merely political diseases, which arise from the misgovernment of nations, as diseases arise from the misgovernment of the human body? What is the immediate cause of these political crimes, but injustice, inequality of the distribution of wealth, the tyranny of one class of people over another, the accumulation of hoards of wealth in the possession of a few, whilst others are pinched for a bare subsistence? The murders, thefts, robberies, quackeries, impostures of society, are as just and equitable a tax upon the public body as the diseases are upon the private body; and their effects will be similar; for by these, and these alone, will rulers be stimulated to the invention of new and more approved modes of government and distribution—they lead to good in the end. Without these crimes, at which we revolt, ignorance and misgovernment would not shock us as they ought; the spirit of discontentment could not be sufficiently aroused to urge on the movement of mental progress. What, then, is evil in the individual is good in the universal spirit, as that which is evil to the individual is good to society at large. Therefore, so far from regarding God as deteriorated in his moral character by causing outrages to be committed in society, we regard these outrages as the lessons of a moral teacher, who is telling us, by the smart of experience, that our political and religious systems are bad, or they would never produce such evil effects. "By their fruits ye shall know them."

In fine, view it as you may, you can make nothing more of evil than what we showed you in the example of the child. It is the "Law," which we first experience in *real suffering*, then we *fear it*, then we *obey it*—three simple processes by which our divine mother teaches us as individuals as well as a great body politic.

This also lets us into the secret of rearing children. We must begin by FEAR. The rod is the beginning of instruction; and we must gradually refine the discipline according to the disposition and capacity of the child; we cannot reason with a child until it become rational; and we cannot teach it fear without showing it evil. Now, without prudent fear, a child or a man is a fool, and his temper is a chaos of passion. There is an immensity of mischief created to the present generation by the foolish indulgence and lenity of parents in neglecting to implant in the young mind the holy principle of FEAR. "He that spareth the rod, hateth the child." The rod, however, like evil, is only for the ignorant; when reason is formed, and has become the guide of life, all corporeal punishments should cease; they are only to be used for

guiding the ignorant and irrational. The law is not made for a righteous man, neither is it made for a wise man: it is made only for the foolish, the perverse, and the ignorant, and these must feel it, and fear it, before they can be converted by it. THE SHEPHERD.

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER II.

IN my former letter I have exposed the general laws of nature, which I mean to apply to the object of my researches.

1. The animal magnetism, or tellurism, is that action and reaction operated by two organic beings, in which the telluric power acts in relation to the solar power, as the positive pole.

2. The essence of the telluric action and reaction, therefore, consists in the preponderance of the quality of telluric life in the agent; though in regard to the *quantity* of the effects, the agent himself may be considered as positive; which action and reaction manifests itself in the different degrees of somnambulism, or night-life, produced in the patient.

3. Since every object on earth is an analogue (or type) of the solar or of the telluric agency, every object is likewise magnetic or anti-magnetic.

4. In the same way that the solar agency produces a certain physiological series of phenomena called watching (or waking), the telluric agency produces a certain physiological series of phenomena called sleep. The physiologists have hitherto neglected this second original form of life; being ignorant of the fundamental laws of existence, they have considered sleep as a mere absence of activity. Hence their futile attempts to explain some of the most striking phenomena, such as dreams, somnambulism, &c.

5. The natural sleep, however, is night-life, or telluric life; it is the half of the cyclus of life; and has its analogue in the change of day and night in the evolution of our planet. Sleep, as the polar antithesis of watching, is related to it like the negative pole of the magnet to its positive pole. Consequently it must present general phenomena of its own kind, exactly corresponding to the phenomena produced by watching in a polar antithesis; which phenomena are the following:

6. The influence of the solar life is diminishing at night, and that of telluric life is increasing; which is visible in the contraction of the muscles in animals, and of the contraction of fibres in plants. This contraction is increasing, and reaches its maximum at midnight, and declines towards the break of the day.

7. The activity of the sensitive system decreases: hence, when sleep is approaching, the sensitiveness for outward influences is almost entirely gone, so that all voluntary movements are at an end. On the contrary, the activity of the vegetative system is increasing; digestion, assimilation, and growth are now active. The wounds are closing faster. Even the plants grow faster at night than during the day-time.

8. In the animal system the activity of the movement

of blood is augmented. Hence fevers are generally increasing; the skin becomes warmer, redder, and more turgid.

9. In the nervous system the function of the brain is dormant, whilst the function of the ganglia is in full activity. During the day-time, and whilst man is watching, the intelligent functions overrule, as positive pole, the faculty of feeling. During the sleep, feeling and imagination overrule the intellectual faculties, and appear in their positive activity. The self-consciousness of *reason* gives way to the self-consciousness of *instinct*. The reason, whilst we are watching, gives birth to ideas and to language; the instinct, whilst we sleep, gives birth to dreams, which are the hieroglyphical language of telluric life.

10. In the ancient world, whilst intelligence had not grown to the summit of self-consciousness, the influence of telluric life was stronger—indeed the two poles were not yet so opposite. The race of mankind was following more the instinct, and all their philosophy, religion, and arts, were rather a produce of feeling and imagination, than of reason and self-determination.

11. This physiological view of the state of the human race explains at once all the doings of the prophets, the priests, the sibyls, the poets, the magicians, the seers, the druids, which the learned ignorance of later ages has declared as self-conscious deceptions. All these phenomena are true. They have been the produce of telluric life.

12. The dreams appear in a threefold form, simple, allegorical, and anthropomorphistical. In the first form, the instinct, freed from the shackles of reason and understanding, has a clear intuition of things that exist at a certain distance in space, or happen at a certain distance of time. In fact, time and space being only the relations of existing things, and viewed by the medium of reason, such relations are no barriers for the instinct, which stands in the medium of the telluric influence in the immediate contact with the objects themselves.

The second form represents things that are, or will happen, in a poetical form. Take, for instance, Joseph's dream in the Bible,—to explain which language a proper study is necessary, the *Oneiroscopia*. The third form, which is the highest, occurs when the dreamer fancies a certain angelic, demoniac, god-like being to unveil to him the present or the future. The genius of Socrates, the angels of the old prophets, the dove seen by the apostle, are examples of this third form of dreams.

THE ALPINE PHILOSOPHER.

FOOD.

(Concluded from our last.)

My next object will be to furnish my readers with a rough estimate of the quantity of labour which is expended on raising and bringing to market the produce of an acre in cattle, flour, or potatoes. We will first assume that land, whether in pasture or in tillage, requires manuring once every two years, and that each acre is manured by twenty cart-loads of dung, drawn by three horses a distance of two miles: it may also be assumed, that each horse requires the attendant labour of one man to drive the cart or spread out the manure. We shall then have, supposing

the horses to move at the rate of two miles an hour, for eight hours a-day, the labour of three horses and three men for five days to manure an acre for two years; and for the annual labour of manuring an acre of land, that of three horses and three men for two days and a half, or of one man and horse for about seven days. If we assume that two horses and two men will plough an acre in two days, and that an acre in tillage requires annually three ploughings, and harrowings and sowing equivalent to two ploughings more, we shall have for the annual labour of tilling an acre of land, two horses and two men for ten days, or one horse and man for twenty days. We will next suppose that the labour required to cut, carry to the barn, and thrash the produce of an acre in corn, is equal to that required to dig and carry to the barn an acre of potatoes; and we will suppose either of these to amount to the labour of one man and horse for eight days. Again, we will suppose the barn to be distant two miles from the market-town, and that the labour required to grind the corn, and carry it to market, is equal to the labour required to transport the greater weight of potatoes to market; and we will assume this labour as amounting to that of one horse and man for six days. On the foregoing suppositions, the expenditure of labour in bringing to market the produce of an acre of land, in flour or in potatoes, will be equal; and this labour will be that of one horse and man for forty-three days. But the labour required to bring the produce of an acre in cattle to market will amount only to that of one horse, and man for seven days. That is to say, the whole labour expended on raising and bringing to market the produce of an acre in flour, or in potatoes, is six times as great as the labour expended on bringing to market the produce of an acre in cattle.

I shall now proceed to deduce some important conclusions from the preceding statements. Since the weights of the produce of an acre in meat, flour, and potatoes, are as the numbers one, ten, and one hundred and twenty, respectively; and since the labour required to bring the flour or the potatoes to market is six times as great as the labour required to bring the meat to market; the labour required to produce and bring to market one pound of meat, flour, or potatoes, will be nearly as twenty, two, and one, respectively. Again, since the powers of nourishment in an acre of cattle, corn, and potatoes, have been shown to be as the numbers one, six, and twenty-four, respectively; and since the labour expended on tilled land is six times as great as that on pasture land, we get the labour necessary to provide a given quantity of nourishment in meat, flour, and potatoes, as the numbers four, four, and one, respectively.

The above calculations, if expressed in other words, amount to this,—that a given population may be fed by the same quantity of labour, whether bestowed on the production of corn or cattle, but six times as much land will be required in the latter as in the former case; and that a given population may be fed with potatoes, by means of one quarter of the labour, and one quarter of the land, which would be required to feed it on corn. Hence, to a people possessed of a given territory, the national advantages of living on meat, corn, and potatoes,

are as the numbers one, six, ninety-six respectively ; this national advantage being properly measured by the ratio compounded of the number of people fed by a given space of land directly, and of the labour expended in the production of a given quantity of nourishment inversely.

We will now suppose, as before, that a grown man would consume three pounds of bread a-day, or that, in a population of old and young, the average daily consumption is two pounds of bread, or its equivalent in meat or potatoes, then the labour required for the subsistence of each individual for a year on meat, flour, or potatoes, (being, as before shown, as the numbers four, four, and one,) will, for meat or flour, amount to the labour of a horse and man for twenty days, and for potatoes, a horse and man for five days. And if we suppose the population to be divided into families of five persons each, and that one man provides subsistence for the whole family, this man must labour one hundred days in the year to sustain his family on meat or corn, or twenty-five days in the year to supply them with potatoes, supposing him in each case to have the assistance of a horse. It is necessary to remark, that in order to estimate the horse's annual labour profitable to man, we must deduct from the whole labour of the horse that part which is necessary to sustain itself and progeny ; this part may be assumed to be forty days, together with a man for forty days, employed on one acre of land. We shall then arrive at this general conclusion,—the labour of one horse and man for three hundred and forty days, (besides maintaining the stock of horses,) is sufficient to provide meat or flour for three families, or potatoes for twelve families, for a year.

Variety is one of the principal sources of the happiness of man ; innumerable modes of cooking potatoes or other roots may be called into action, to satiate this passion for variety ; and corn and meat repasts may be indulged in occasionally for the same reason. What, therefore, is to be recommended to a nation as most conducive to its power and happiness, is, to derive its principal sustenance from roots, and for the sake of variety to have corn repasts occurring with tolerable frequency, and meat repasts occurring at long intervals. Fish is manifestly one of the best articles of consumption.

We shall not err far from the truth, if we assume corn or grain to be the food of all nations ; for in those countries in which much flesh and roots are consumed, the land and labour which are in excess in providing flesh, may be considered as compensated by the diminished land and labour required to provide potatoes or other roots. My calculations, which apply more particularly to England, may have their application easily extended to most parts of the world, by making allowances for the different states of agriculture, in different countries. Food being the chief article of consumption of all men, and the kind of food consumed being corn, it will be proper to repeat what has been shown above, viz., that in a nation where the art of agriculture has made any considerable progress, *the labour of one man and horse for three hundred and forty days a-year, is sufficient to support with corn fifteen people, or three families, and that each acre will yield corn enough for two people.*—Edmonds's *Practical Moral and Political Economy*.

PARLIAMENTS.

We expect only negative good from parliaments ; we expect them to destroy the present system, and then destroy themselves—they are mere destroyers. Their office, however, is a necessary preliminary for positive good ; therefore we rejoice to see an accession of power to the House of Commons. We rejoice at it, because the more power it has, the nearer its destruction as a legislative body. It is impossible for an assembly of six or seven hundred individuals to do any active work ; and the more eloquent, the more skilful in law and literature those members are, the more useless they will become. The people are determined to have orators. Would to heaven they had their fill of them ! In a very short while they will be as sick of orators as we are of church-rates and sermons. Six hundred and fifty-eight orators ! Popular men ! men who made long speeches on the hustings to their constituents, and promised to make as long speeches before the speaker of the House of Commons, and pledged themselves that the newspapers should be full of their patriotic effusions ! This will be a heavier tax upon the press than the newspaper stamp, and another crusade against taxes upon knowledge will immediately be raised ; nor will the outcry be stilled until these talkative legislators are laid as low in the grave of humiliation as their predecessors, the Whigs and the Tories. We expect nothing but confusion from parliaments, greater and greater confusion the more popular they become, till by and by it will be a circumstance almost miraculous when a single day is passed within the house of legislature without some furious uproar, which not even the retreat of the speaker himself, with his hat on his head, will be able to still. Every session is becoming more and more riotous ; and the spirit of Cromwell is patiently waiting for an opportunity of turning the fellows into the street. We will rejoice to see him, and so will the people, for by the power of the people alone he will do it.

The people don't know it, but it is a living truth, that a parliament is their greatest enemy ; it is merely a nest of aristocrats, and ever must be. To convince, to persuade an individual, is easy. There is mercy in one man, but no mercy in a multitude ; there is wisdom in one man, but no wisdom in many : no man cares for the wrong committed, when he shares the blame with a thousand others ; but when he himself is responsible, he acts very differently. We are only progressing towards perfect monarchy. The first species of monarchy was arbitrary ; it was tyranny ; the monarch was accountable to no man ; he had a divine right to rule, plunder, and murder. Such were ancient kings ; such were British kings before the Reformation—tyrants. There was no remedy for it ; for there was no printing press, no bond of union, or freedom of correspondence amongst the people ; it was the only practical government. As progress advanced, the people advanced—that is, the chief of the people, nobles and rich men ; and these assembled in parliaments, and became masters of king and people. These masters have been growing in power till now ; KING and PEOPLE are mere tools, or victims of a proud and heartless aristocracy, who divide the blame of mismanagement amongst them,

and still their consciences by saying that others are as bad as they. This is the second step, from one master to many masters; the third step is the destruction of this parliamentary mastery, by the acknowledgment of equal rights and privileges to all. This power of the whole population, however, must be expressed; it will be expressed by the election of a parliament; and that parliament must have its power expressed, not as now by votes of its members, but by an individual invested with supreme and sovereign power, the first servant of the people, responsible for all his actions to the tribunal of public opinion. He will take what assistance he may from his council, but not be swayed by them to do or not to do; he will communicate his measures to parliament by means of his ministers, and through the parliament it will be conveyed to the people. Parliament will discuss; the people will judge; the public mind will be instantly discerned by the tone of the press and the movement of the mass, and the supreme mind will act accordingly. **THIS IS THE SOVEREIGNTY OF THE PEOPLE.** Were the parliament to vote, it would not be the sovereignty of the people, but the sovereignty of parliament; and it would depend upon accident which side of the question carried; it would depend on the number present, on their humour at the time; and not being so responsible as an individual, they would think less upon the subject, and merely side with a party; but one mind would balance the whole, and, knowing his responsibility, would act accordingly. We can see no possibility of order in government without such a system of individual monarchy; as for tyranny and corruption, under such a system, they are impossible. The check is equal on both sides; and there is no chance in the matters at present, when the tossing up of a halfpenny would be as good a way of determining a parliamentary question as the method now pursued; at any rate, it is impossible that the sovereignty of the people can be established in any other form than that of a representative monarchy. We have no hesitation in prophesying, and risking our character upon the result, that the hatred of parliaments and parliamentary legislation will continue to grow in the public mind from henceforth until the system of oligarchical masterhood be swallowed up in the two extremes of individual and universal sovereignty—the first expressed positively by active measures, the second expressed negatively by public opinion. This is the positive and negative form of government, corresponding to the sun as unity in the positive pole, and the planets, satellites, comets, &c., as the multitude in the negative pole, and the harmony will be corresponding. Two or three more suns would play the devil with the system, and so will a parliament. These are the lessons of Nature; if you want to be happy, follow them and teach them; but if you want to practise disunion and American republicanism, then take up your cross and follow him that leads the way to strife and the sword.

MARCH OF SCIENCE.

THE following is a specimen of a barber's bill, which we give for the amusement of our country readers, who perhaps have no idea of the refinement and science which

are creeping insensibly into the humblest vocations of life. It was put into our hands in Cornhill, and is merely a specimen of many others, though we must acknowledge rather unique and original:

“**NATURE AND ART COMBINED.**—Nature from time immemorial has been admired by all; the philosopher and the peasant have alike pondered over her beauties, and gazed in admiration at her wonders. But where art is combined with her efforts, and man has supplied her defects, how much superior have been the effects produced! A garden planted with all the exotics of the east, though grateful and enchanting to the senses for a time, would, without the aid of science, soon be overrun with weeds; the plants, become weak, would droop and die. This exordium is given to prove that the hair, though naturally curling, glossy, luxuriant, and beautiful, would, without art and the skill of the operator, soon become decayed, unpleasing, and unsightly. As a scientific man is requisite for the garden, so is a finished artist required for cutting and arranging one of Nature's greatest ornaments, a fine head of hair.” Here the barber gives his name and address, which we withhold, to prevent this article being regarded as an advertisement, and then says he “offers himself as a professor of that art, and pledges his reputation that those who may honour him with a visit, may place implicit confidence in his skill. Practice having given him superior talent, and enabled him to restore a head of hair to its pristine beauty, when so desirable an end has appeared hopeless. The charge for cutting and arranging the hair in a style perfectly unique, 6*d.*”

When barbers become men of science, pray what must men of science become? Why, barbers, to be sure, you simpleton. All men must become barbers at last, for knowledge and science are becoming universal. And what shall become of the women? They must become hair-dressers, and go into partnership with the men. Alas! alas! what a fearful “crisis” the printing-press is bringing upon us.

PREJUDICE.

HAVE you ever seen a Molinist convert a disciple of Jansenius? The friends and adversaries of the corn-trade divide the capital: they sup together, they dispute, they lose their temper; but I have not observed that they make many proselytes one from the other. Time, far from making us wiser, only renders us more obstinate. Ideas and systems, after being long in possession, become a sort of patrimony, which we defend with zeal. Did ever a young man, how grounded soever in reason and truth, produce a change of opinion in a man of fourscore? The Abbé de Molières died fighting upon the ruins of the system of Descartes. Such conflicts resemble those battles in the field, which decide nothing, and after which the two armies sing a *Te Deum*.

We must confess it, we are the heirs of prejudice much more than of truth: truth itself is never obstinate, until it degenerates into prejudice. We should not dispute, we should enlighten one another, if we could make ourselves mutually understood: but our conversations are no better than the reasoning of the deaf: our ideas, in process of time, strike deep root; they send forth

branches that fill up the whole head; we neither see nor listen to any thing but them; all access is shut, and forbidden; new ideas, weak, because they are recent, have not force enough to make their way; and in order to find admission, they wait for raw and inexperienced heads: thus it is the youth alone that give them a welcome reception; they cannot become new again, but in the course of many generations.

What I have just said of men will apply to nations in general, with this difference, that a nation is always more obstinate than an individual. The multitude have no ears; and though in the footsteps of their ancestors, they preserve their manners and opinions with all the fondness and dotage of old age.

Nature, which established a state of war between man and man, and between one people and another, has implanted the same division in their minds; they resist the admission of certain ideas, certain opinions, certain usages; not because they are bad, but because they are foreign. If some of those ideas or opinions contrive to introduce themselves, it is by fraudulent and illicit methods; and truth, equally the property of all countries, to which man never fails to oppose a resistance, proportioned to the inert and ignorant state of his mind, is sure to be proscribed, the moment it presents itself in a strange dress. If it is admitted at all, it is not till after repeated contests between reason and prejudice. It must have been long and maturely examined, and that examination must have so naturalised it in men's minds, as to make them lose sight of its origin.—*Bailey's Ancient Asia.*

BLOWFLY.—It was asserted by Linnæus that three flesh-flies would consume a dead horse as quickly as would a lion. This, however, must be understood as having reference to the offspring of such three flies; and as a proof of such assertion, it has been ascertained that a single female of the *musca carnaria* (flesh-fly) will give birth to twenty thousand young, which must of course be gradually developed, as they will necessarily occupy several days in being deposited by the parent. Each of these grubs, in twenty-four hours, will, in consequence of its intense voracity, have increased in weight not less than two hundred times, and in five days they acquire their full size. It requires about the same time to undergo the pupa state, so that in about a fortnight's time there are descendants of the first brood in existence. When ready to appear in the perfect state, and to quit the shell-like cocoon in which they have passed the pupa state, the inclosed fly bursts forth at one of the extremities of its case. This is effected by the dilatation of the leather-like front of the head, which is alternately pushed forward and withdrawn, and by the swelling out of the cheeks; by this means, a small circular cup, which appears in this group of insects to be especially employed for this purpose, is detached, producing an aperture sufficiently large for the escape of the fly, which at this time exhibits, as it were, only the rudiments of wings, those organs being twisted up in several crumpled-like folds, but which, in the space of a very few minutes, are gradually stretched out, when the fly appears in its perfect form, and is ready to assume all the energies of its species.

SUPERSTITION.—This word is used by all, but understood by none; in fact, it has no meaning but a relative or sectarian meaning. An atheist thinks a man who believes in a God is superstitious; and the believer thinks the atheist even more superstitious still to imagine that Nature can be conducted without a mind; we have even been accused of superstition by some, because we speak of a systematic plan of action in Nature! Such critics, of

course, imagine themselves very wise because they see none—a mole must be wiser still. What an immensity of rubbish there yet remains to be removed from the public mind! There is scarcely an individual to be met with who can reason upon the first principles of Nature. Our own idea of superstition is, that it is a slavish fear of God and spiritual beings; it is the fear which makes it superstition; it is the fear which creates bigotry and intolerance, under an apprehension of divine wrath being poured out upon heretics. Divest a man's opinions of this fear, and he ceases to be superstitious; but if any one considers us as superstitious for our systematic arrangement of the progress of Nature, then we have no objections to be considered very superstitious in that respect; but we would rather be esteemed so, than rank side by side with men who see no system in Nature, or who carry absurdity to its very extremity by talking and writing of a system of Nature without a plan—*alias*, a system of Nature, without any system at all; this is philosophy run mad, or with those who talk of a system of Nature, without including Judaism and Christianity, or any religion particularly. This is as absurd as a system of zoology, without including man, or any other animal particularly, either to enquire into its structure or destiny. No; we have taken a sure ground; and no weapon formed against us can prosper, for we embrace all Nature, both past, present, and future; and it will be hard for our opponents to find any thing out of Nature.

POSITIVE AND NEGATIVE HEAT.—The result of intense cold (such as is felt in Canada) is, if not guarded against, similar to that of intense heat, with this exception that it is easier to guard against the effects of the one in North America than against the other in India. A cold iron, during a Canadian winter, when tightly grasped, blisters and burns with nearly equal facility to a hot iron. The principle, in both instances, is alike—in the former the caloric, or vital heat of the body, passes so rapidly from the hand into the cold iron, as to destroy the continuous and organic structure of the part; in the latter, the caloric passes so rapidly from the hot iron into the hand as to produce the same effect—heat, in both cases, being the cause; its passing into the body from the iron, or into the iron from the body, being equally injurious to vitality. From a similar cause the incautious traveller, in Canada, is burnt in the face by a very cold wind, with the same sensations as when exposed to the blast of an eastern sirocco. The term frost-bitten is the effect produced by extreme cold, when accompanied by a sharp biting wind. At this period persons are liable to have the nose, toes, fingers, ears, or those parts where the circulation of the blood is scanty and slow, frost-bitten, without their own feelings informing them of the presence of the enemy: and the knowledge of this is first made known to a passing stranger, who observes the nose (for instance, if frost-bitten,) becoming quite white, while the rest of the face is very red. In such a predicament it is, at first, startling to see an utter stranger running up to a traveller with a handful of snow, calling out, "Your nose, Sir, your nose is frost-bitten;" and, without further ceremony, rubbing without mercy at your proboscis—it being the first time that any one had ever dared to tweak and twinge that honorary vulnerable part. If snow be well rubbed in, in due time, there is a probability of saving the most prominent feature in the face; if not, or if heat be applied, not only is the skin destroyed, but the nose and a great part of the adjacent surface are irrecoverably lost.—*M. Martin's History of the British Colonies*, vol. iii.

ATHEISTS.

WE have been attacked by Atheists, or "Chaotics," both in public and private,—men who have an inward dread of any species of knowledge being reduced to its first principles, and therefore are everlastingly harping on the negative chord, to the tune of "No, no, no." What do they want? What is their object, in preaching a crusade against intelligence, design, plan, harmony, purpose in nature? What can be the cause of their intense hatred against the infinite extension of mind as well as of matter? But the fun of the matter is that they call themselves philosophers, who reason from experience. We answer all such sons of dead unintellectual matter by submitting to them the following syllogism:—

First Proposition.

We can have no experience of any mode of action but sensitive, voluntary, or mental action.

Second Proposition.

The mode of action which the atheist ascribes to Nature is not voluntary, sensitive, or mental action; but something he calls chemical action, which is beyond our experience.

Conclusion.

Therefore the atheist is a visionary, who departs from experience in his first principles—worse than an ordinary visionary, who really has a foundation for his dogmas.

Illustration.

When we affirm that we can have no experience of any mode of action but sensitive, voluntary, or mental action, it is only saying in other words, that "all our own actions are caused by operations of our own individual minds." When our body makes any movement which does not originate in that source, we don't call it our own action. Thus the heart always beats, the blood circulates, the glands secrete, &c.; but these are not our own actions; they are caused by a power unknown; but the inference of experience is clear enough that that power unknown is of the same nature as that power which causes our own voluntary actions; that power is *mind*. To maintain, or even to admit, that action in universal nature is not the action and reaction of mind and matter, when experience teaches us that all the individual movements of animal life are such, is a gross perversion of all the rules of right reason, and an egregious departure from the field of experience.

What the atheist may believe or not believe is a different thing. He has a right to make creeds and articles of faith for himself as well as priests and other fanatics; but his claims to sober sense and sound reasoning have but a very sorry foundation. Far be it from us, however, to despise him; he is a better man than the vulgar Christian. The latter is a blasphemer, he makes a monster of God—the other has a good heart, and because he cannot see the utility of *EVIL* in the dispensations of Nature, denies her consciousness and intelligence. He is nearer the truth than the fanatic, for he has no superstitious fears; but he has strong prejudices against any thing like plan or system in Nature, and seems to have a most unaccountable predilection for a universe in confusion.

We have already destroyed much of this spirit in our readers. Many have confessed to us their former errors, and now rejoice in the new light of science and revelation combined. The doctrine of *evil* is the great stumbling-block; but the necessity, end, and utility of *evil* will soon become apparent to those who continue to read.

GOOD OLD TIMES.—A certain archbishop of Mayence being asked alms by a company of poor people, called them rats, and ordered them to be burned in an old barn. After this, he was haunted by rats, which climbed up the walls to come at him. He fled to a tower upon a small island in the Rhine; nevertheless, the rats scaled the walls, and devoured him. Mr. Misson saw the ruins of this tower, which to this day is called the Rat's-tower, and says, though some reckon it a fable, yet it is believed by the people hereabout, who produce several histories of it, related by persons of unquestionable authority.—[Would to God we had such rats now-a-days! a few of such useful creatures would be serviceable at Rathcor-mac.]

TRANSUBSTANTIATION.—There is a church dedicated to St. Martin, at Worms, at the entrance of which is a representation of God the Father like an old man, at the top of one corner, from whence he seems to address himself to the Virgin Mary, who is on her knees in the middle of the picture, holding the infant Jesus by the feet, and putting his head into the hopper of a mill which is turned about by the twelve apostles. Hard by the pope is painted upon his knees, receiving the hosts of wafers which fall ready made from the mill into a golden chalice; one of which the pope presents to a cardinal, who gives it to a bishop, the bishop to a priest, and the priest to a layman.—*Misson*, 1740.

BLACK MEN.—Lislet, a Negro of the Isle of France, was named Corresponding Member of the French Institute, on account of his meteorological observations: Hannibal distinguished himself as a colonel of artillery in the Russian service; and Fuller, of Maryland, was an extraordinary example of quickness in reckoning. Being asked, in a company, for the purpose of trying his powers, how many seconds a person had lived who was twenty-seven years and some months old, he gave the answer in a minute and a half. On reckoning it up after him, a different result was obtained. "Have you not forgotten the leap-years?" said the negro. The omission was supplied, and the number then agreed with his answer.

CORRESPONDENTS.

W. N. is received, and we shall have much pleasure in inserting his letter next week.

We beg leave to call the attention of our readers to the Alpine Philosopher's letter this week. It is an admirable production, and we have the satisfaction of finding in him an able coadjutor, reasoning upon the same pair of principles as ourselves. There is no other mode of analysis which is universal in its application.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admission Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Bready, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 20.]

SATURDAY, JANUARY 10, 1835.

[Price 1d.]

SYSTEM OF NATURE.

We have now shown the positive and negative action of evil and good, and the necessity of referring both for existence to the same universal cause. We have also demonstrated the absurdity of the first principles of all the moral and religious instruction of the world, which has hitherto proceeded upon a contrary supposition, to the great confusion of all the elements of human society.

We shall now proceed still farther in our analysis, everlastingly keeping in view this eternal and universal law of Nature, the POSITIVE and NEGATIVE action. These two ideas must never be lost sight of by our readers, otherwise they will most assuredly misunderstand us, and confound themselves. They are the two swords of St. Peter, and the two cross-keys of knowledge, without which there is no admittance into the arcana of Nature.

Last week's article was a diversion for an especial purpose, and we trust a most useful diversion, for throwing the important subject of *Evil* into clearer light. Before that we were upon the Positive and Negative doctrines of Justification—Christ individual and universal, &c. We shall now speak of one important elementary doctrine of religion, namely, Redemption, without the illustration of which it is impossible for us to proceed. The first question then to ask, in conformity with our mode of analysis, is, "What are its positive and negative doctrines?" The positive doctrine of the old church is, "The elect, or a small number only, shall be saved." The negative doctrine to this is, "All men shall be saved."

Now, it must be remembered here, that the positive doctrines of the old world become negative in the new, and the negative of the old become positive in the new.

It is scarcely necessary to prove by quotations from Scripture the doctrine of future and eternal punishments. The passages are too numerous, and have been too frequently impressed upon our minds in infancy and manhood to be forgotten. We think, therefore, that we may safely take it for granted, that fire and brimstone, the worm that never dieth, weeping and wailing, and gnashing of teeth in outer darkness, are in reservation for the wicked—"the smoke of whose torment ascendeth up for ever and ever before the presence of God and his holy angels." We shall therefore now address ourselves to the task of demonstrating the negative doctrine; namely, that which gives the lie to the positive, and treats it as an imposition on human credulity. It is this double character of the Bible which distinguishes it from all other books, and stamps it with the royal seal of Nature as the book of books.

"God sent not his Son into the world to condemn the world, but that the world through him might be saved (John iii. 17). Of that Son it is said, "he gave himself a ransom for all men, to be testified in due time" (1 Tim. ii. 6); as much as to say, there is a time when this great truth shall be testified and demonstrated; but we must suffer the nightmare of priestly fear, and real fire and brimstone, to sit upon the people for a few generations more, until they have got a fair trial of the influence of superstitious fear in preserving the morals of society—then we shall let out the great secret, that all men shall be saved. In corroboration of this text, the Apostle of the Gentiles also reasons in the following manner:—"that as in the first Adam all men died, so in Christ, the second Adam, all shall be made alive" (1 Cor. xv. 22). He balances the two together, and shows that the Saviour must undo all that the destroyer does. "Therefore, as by the offence of one judgment came upon all men to condemnation; so, by the righteousness of one, the free gift hath come upon all men to justification of life" (Rom. v. 18). John also reasons in a similar way when he says that Christ is the propitiation for our sins; and not for ours only, but also for the sins of the whole world (1 John ii. 2). All this is in perfect accordance with the promise made to Abraham, that in his seed all the families of the earth should be blessed; as also with the frequent declaration of the Prophets, that *all flesh* shall see the salvation of God. These are powerful texts against the fire and brimstone doctrine, and they puzzle the priests exceedingly; so much so, that they are seldom or never quoted to the people. They are also powerful arguments, amongst many others, against that absurd opinion which prevails amongst the superficial infidels of the present age, that the Bible is an invention of the priests! Yet it is a book to which the priests always gave their decided opposition, till it was forced into reputation by the patronage of the people, preserved un mutilated and uncorrupted by the jealous eye of sectarian criticism.

But what do the priests say in opposition to this negative doctrine of universal redemption? They say that when the Bible says *all men* shall be saved, that *all* means *some*; and therefore, it should be read "*some* shall be saved." Therefore, according to them, St. Paul ought to have reasoned thus: "As in Adam *all* died, so in Christ shall *some* be made alive; and as by the offence of one, *all* were condemned; so by the righteousness of one, shall *some* be justified." Beautiful logic! Exquisite reasoning! Behold the value of a *liberal* education, in enabling the *pious* mind to handle the word of God *discreetly*, and correct the diction and bad logic of the Holy

Spirit! Yet this is what all the clergy do when they treat of the subject *critically*—which they seldom do—and therefore their most approved and convenient plan is to muster all the *positive* threatening passages, saying, “thus speaketh the word of God in the most *positive* manner;” but they don’t bring forth the *negatives*.

We have heard them occasionally, however, when almost constrained, either by the doubts or infidelity, or strong argumentative reasoning of some opponents, actually venture to contend against mercy and justice, and employ all their eloquence, learning, and sophistry, to tread the *love* of God under foot, and prove him by the book to be a devil for ever, with whom prayer and supplication shall be useless, and to whom the everlasting yells of infidels, heretics, and *hypocrites*, in sensitive torment, shall be the music of justice and mercy, combined in infinite, overflowing fulness!

This was certainly a rich treat when it took place; and, like a Christmas pantomime, it only came at certain seasons. But the reader may enquire what they do with the negative, how they smother all the promises of universal redemption and infinite love? Some have one way, some another; some deny them flatly, by translating them with a barbarous and savage twist, to which their hearers listen in respectful reverential silence; others count the passages which threaten reprobation and torment to the unbelievers, and compare them with the number of passages which promise salvation to all, both good and bad; and finding the *evil* to predominate, they say, “Dearly beloved, it is evident that damnation is the truth, for the number prevaileth on this side of the question. There is but a small number of passages that promise salvation to all; therefore, I would have you not to depend upon them; follow the multitude.” Beautiful reasoning for an expounder of that book, which says, “Mercy shall triumph over judgment,” which says that God giveth not victory to *number*, but “one shall chase a thousand, and two shall put ten thousand to flight!” Is not *one promise* of God stronger than a *thousand threats*? are not two promises of God stronger than ten thousand denunciations of judgment? If not, how can it be true that “Mercy is his *darling* attribute, judgment only his *strange* work,” and that mercy shall finally triumph over judgment?

There are numerous other proofs which might be adduced; but our space is small, and the above are quite sufficient to establish the counter doctrine of universal redemption, in opposition to the partial redemption of the priests. But there is one which, by its conciseness and fullness of thought, is worthy of particular attention, viz.—“God is the saviour of *all* men, especially them who believe”—(1 Tim. iv. 10). Here is a distinction between faith and infidelity; but salvation to both—an especial salvation to faith. Those who read our seventeenth number carefully, may understand this at once. They are not to suppose that there is more faith in a priest or Christian than an atheist—not a particle; if Christians had more faith than others, they would lend and borrow more freely, and with less fear, jealousy, or reluctance than others; but is it so? Can one Christian go into another Christian’s shop and say “I shall take this article;

trust to my good faith in repaying you?” No; the other Christian wants a *security*; and even when one Christian pays a debt to another Christian, he does not think himself safe unless he have a stamp receipt as a guarantee against the roguery of other men of faith like himself. The atheist does the same; but he is neither better nor worse: we have all the spirit of the *old* world, and that is a spirit of infidelity, or want of faith—it is negative faith; and the more faith a man professes, the greater liar he generally is. Compare this faith with the faith of Christ—Luke vi. 34, “If ye lend to them of whom ye hope to receive, what thank have ye? for *sinners* also lend to *sinners*, to receive as much again; but love ye your enemies, and do good, and lend, hoping for nothing again, and (here is the trial of faith) your reward shall be great, and ye shall be the children of the Highest, for he is kind to the unthankful and the evil.” What a farce the faith of the world is, compared to this! ‘Tis the same also with charity—“He that giveth to the poor, *lendeth* to the Lord;” but the Lord has got so little *credit* amongst the sons of this old world’s faith, that the poor are going destitute in the streets, without food to eat, or a home to shelter them; whilst the faithful defenders of faith as it is, are lolling on their sofas before boards of luxuries! Faith! faith! there is no faith in the world, unless you go amongst savage nations, whom the missionaries cannot convert, and there you may find a little of it; as also among the Mahometans, where the merchants lay down their goods in the bazaars with the prices attached, then go and smoke their pipes in the coffee-houses, come back, and find the money instead of the goods, which the purchaser has quietly taken away. This is faith; and it is faith in God; for if men have no faith in each other, their faith in God must have a sorry foundation, since it all rests upon human testimony: without this faith there is no salvation for man; a system of faith is a system of universal credit. In our own experience we have met only one instance of such faith—it was in a seal engraver; we called at his shop for a trifling article, worth half-a-crown, and happening to speak of watches, he said he had a fine gold repeater to dispose of very cheap. He showed it instantly; it was a beautiful piece of workmanship. We asked if it kept time well. “You may have a trial of it,” he replied. And do you know the person to whom you give it, was our answer? “No,” he said, “but I have no fear.” We had no intention of purchasing; but we determined to put his faith to the test. We took the watch, without depositing a farthing, or giving any security whatever, carried it about for several days, and at last returned it; and to this day the man neither knows our name nor character. This is faith, and a world of such faith would be a paradise; but it belongs to neither Jew, Christian, nor Infidel, and in a state of things like the present, it is not prudent, for faith cannot grow in this old world any more than grapes can grow on the shores of Greenland.

It is easy to see, then, how an especial salvation is bestowed upon the children of faith, or the new world: they are born, bred, and live in paradise; as the prophet Esdras says, they do not see hell. But still, as our quotation has it, God is the saviour of all men; and the

doctrine of universal redemption is a doctrine of the Bible and of Nature.

Then the query is, how are these two contrary propositions reconciled? Very easily; as easily as the positives and negatives of any other department of Nature. The one alludes to the person, and the other to the principles, which are the positive and negative poles of our nature. When it is said that the wicked shall be destroyed, it means that all wicked principles shall be destroyed with eternal punishments; and this is a great blessing, in which we shall all rejoice. When it is said that all men shall be saved, it means that whilst the principles are destroyed, the person shall be saved, but renewed; as St. Paul says, the man himself shall be saved, yet so as by fire. Eternal punishments are therefore a blessing; they mean nothing else than the destruction of evil. "The word of God is not carnal, but spiritual. The carnal mind cannot receive the things of God, neither can it know them, because they are *spiritually* discerned."

But why, it may be asked, express the thing so mysteriously? We reply, it is only mysterious to ignorance. The doctrine of the positive and negative action of Nature is simple, and intelligible to a child, when the child is taught it; and if men had been told *how* it was, and *what* it meant, then they would not have discovered it. Man must find out every thing; even revelation itself is ignorance and darkness till human reason and science have analysed it, so that all knowledge is elaborated by the human mind from the materials in a rude state which Nature presents it. As she has given the material world to the senses for us to analyse, so has she given the moral and spiritual world to the imagination. Sensible nature and revelation are the positive and negative elements of thought; both are equally unintelligible at first; and in the progress of the human mind, the full and satisfactory dissection and demonstration of both come out together; so that at the very time when Faraday (this he did about a month ago) is declaring at the Royal Institution that the whole science of chemistry is about to be revolutionized, and established upon a new base, we are now laying a new foundation of spiritual and intellectual chemistry, exactly corresponding to his. His foundation is, the positive and negative action of the electric power, which is now supposed to be the great ostensible *chemical* agent of Nature; we are, therefore, in the very van of progress, and are anticipating a new practical and theoretical universal philosophy. THE SHEPHERD.

MIND AND MATTER.

TO THE EDITOR OF THE SHEPHERD.

SIR,—Most of your readers are doubtless aware that there is a philosophical hypothesis which denies the real existence of matter, time, motion, and space, maintaining that all these are but mental perceptions, or imaginings of the mind, and that, consequently, if there were no minds, these appearances would not have even a fancied existence. Probably, however, few of them have given this theory any attention, taking for granted that the current opinion concerning it was correct, namely, of its being too manifestly absurd and visionary to be enter-

tained by sane intellects. I once thought so myself; but a more liberal schooling has made me extremely careful how I decide before examining. To doubt is certainly the first step towards philosophy, but to examine is the next; and the not taking this second step often renders us ignorant and presumptuous bigots.

Now, Sir, having had my curiosity very much excited by the above-mentioned theory, and not wishing to rank among the bigots, I beg to avail myself of the highly liberal manner in which you have opened the pages of the *Shepherd* to the seekers for truth, and to ask for information on the subject from yourself and that part of your flock who may have reflected upon it. By way of opening the investigation, permit me to subjoin a few propositions, or rather questions, which present themselves to my mind with reference to the subject. The doctrine was, I believe, known to the ancients many centuries ago. In our own country, Bishop Berkeley is the principal writer who has supported it.

Propositions and Queries.

1. We can know nothing of matter, time, motion, and space, but as our senses are really or imaginarily affected by their qualities or attributes.

2. That, while in our waking state, these qualities or attributes affect us through the intervention of the five senses only.

3. But that in dreams, during the state of sleep, and in some diseases, we are affected, in imagination, by all the properties or attributes of matter, time, space, and motion, and believe them existing or going on around us as vividly as during the hours of wakefulness and health.

4. Hence, does it not follow, that it is not absolutely necessary that matter, motion, time, and space, should have a real, independent existence, in order that we should believe their existence; and that, consequently, it is possible that the universe may be one in idea only, life itself be but an idea, and dreaming its natural type: in other words, that nothing exists but mind—the universal mind, and its creations of secondary minds?

5. Does not this hypothesis of the non-existence of matter, time, motion, and space, escape many of the difficulties and incomprehensibilities to which the opposite doctrine leads, especially the following: first, as regards matter, its infinite or definite divisibility; secondly, as regards time, its eternity; thirdly, as regards space, its illimitableness? It does not, any more than its contrary, attempt to search into the mysteries of first causes.

6. The only true notion of time we can form is that which arises from the contemplation of the succession of our ideas or thoughts. This is proved by our being insensible of time while under the influence of sound sleep, insensibility, or syncope.

7. As space and motion can only be measured by a comparison with matter, if the existence of matter be a delusion, so must also the former be delusions.

Fearing that I shall be trespassing upon the limits of your paper, I will not trouble you any further at present. Before I conclude, however, allow me to remark, that the doctrine under consideration does not seem to me in any way to detract, as some will have it, from the

sublimity of nature, but rather to increase it, at the same time giving rise to extended hopes in man as to the future which awaits him. Nor does it lessen in any degree our interest in this our being, for, after all, if *all* we are conscious of is but mere appearances and delusions, it is with them only that we have to deal; and as they are presented to us by uniform laws, it is our true interest to search after these laws, and to regulate our conduct, and form our opinions, according to the knowledge we thence derive. I am, Sir, &c.

London, Dec. 29, 1834.

W. N.

[W. N. is quite correct. The existence of mind is an axiom; the existence of matter is an inference which we take for granted. Mind is therefore the positive, and Matter the negative.]

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER III.

If all in nature is subjected to the general law of Polarity; if the most general form under which the law of polarity manifests itself on earth is the phenomenon of solar and telluric life, the whole race of mankind, as well as the single individuals, must be subjected to the same general law.

1. In fact, if we consider the history of the human race, we find it following in its development the physiological laws of solar and telluric life.

2. The solar life of mankind consists in the manifestation of intelligence and liberty; the telluric life, on the contrary, consists in the manifestation of instinct and necessity. The more mankind is subjected to the telluric life, the more will instinct and necessity govern the world, and the expression of all actions, morals, and feelings will be concentrated in one focus, called belief or faith. The more mankind is subjected to the influence of solar life, the more will intelligence and liberty govern the world. The general expression of all actions, morals, and feelings will be also concentrated in one focus, called knowledge.

3. But since polarity is the universal law, there can be in the history of mankind neither faith without knowledge, nor necessity without liberty, but both must always exist, and will ever exist together: the only difference between one epoch and the other will be their $+$ or $-$, or the preponderance of the one over the other. The coexistence of the two aspects of life, the positive and the negative, and their oscillatory process was allegorically expressed under the struggle of two principles.

4. The ancient world presents the phenomena of telluric influence. It is the night of mankind; here wonders, divinations, dreams, prophecies, oracles, and revelations, follow one another. As the animal by instinct builds the most wonderful cells or nests, moves and travels from region to region, distinguishes the healing or nourishing food from that which is poisonous and unwholesome; in the same way the seers, the magicians, the priests, the poets, the artists of the old world, performed those deeds which the most enlightened among the children living under the solar life can now neither understand nor believe. Thus the waking individual can scarcely comprehend and believe that which he has dreamed or done during that part of life which he calls sleep.

5. The ancient world had reached the summit of telluric life when Christ and the Christian had made their

appearance. The earth was then on the highest point of somnambulism. By the means of Christ, and through the Christian religion, the family of mankind began to awaken. Christ's wonders are as it were the morning dreams of one who is near to open his eyes to the beams of that centre of light that calls forth the solar life in nature.

6. This philosophical bird's-eye view of the past can alone explain the twofold nature of Christ, and the twofold forms under which Christianity must appear.

7. Primitive Christianity, with its wonders, with its belief, with its instinctive necessity, is the last and most luminous aspect of telluric life. Christianity, with its new world and its new heaven, with its law of love and liberty, with its appeal to reason, belongs to the solar life; hence the discovery of printing, the Copernican system, the manifold discoveries in all sciences, and the science of tellurism, or animal magnetism, could only occur under the influence of solar life.

8. Our readers must, however, bear constantly in mind that the general law of Nature being polarity, and each pole being a constituent part of the whole, the preponderance of a pole over the other does not imply the destruction or absence of the other. During the telluric life of mankind, the solar life was also existing, but subordinate to the telluric life; and, *vice versa*, when the solar life shall have reached its summit, the telluric life will still exist, only in a subordinate state.

9. Since nations and individuals are not insulated in Nature, but stand to each other in the relation of polarity, there will be always nations and individuals who, in relation to the others, will be the representatives of one of the two poles.

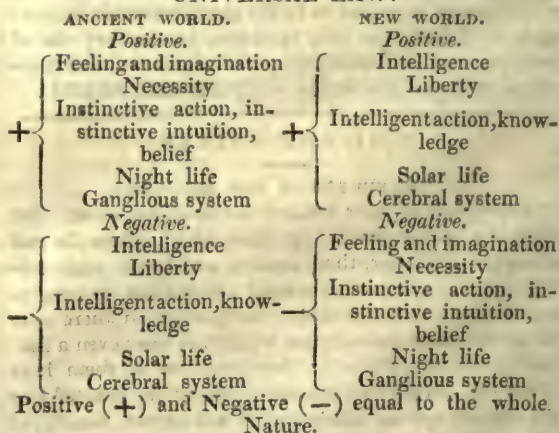

10. The Jews, in relation to the Gentiles, were the representatives of the positive pole; and the Jews were the negative pole in relation to the Egyptians. At present, the whole east is, in comparison with the west, in a state of somnambulism.

11. The religious books of the Hindoos, the Zend-Avesta, the Bible, the Talmud, the Koran, are not inventions of designing priestcraft, but divine dream-books of inspired seers.

12. The gods, or the god of these religions, were but allegories, or personifications of some principles of life. They were but partial, individual creations of telluric influence.

13. The diagram of the whole history of mankind, as viewed by the eyes of the philosopher, is the following:

UNIVERSAL LAW.

THE ALPINE PHILOSOPHER.

AIR AND WATER.

ATMOSPHERIC air is composed of two gases, oxygen and nitrogen. When these two gases are separated, and enclosed in a glass receiver, they exhibit two distinct properties diametrically opposed to each other. If you take a burning match whose flame is gone, and the red ember merely glowing, and dip it into the oxygen, the match is immediately rekindled, and burns with the greatest vehemence, emitting a light which is dazzling to the eyes. It is almost impossible to look upon phosphorus burning in oxygen. On the contrary, take a flaming match, or burning phosphorus, or burning coal, and put it into nitrogen, and it is instantly extinguished. These are the two ingredients of air, which support life—extreme opposites. Which is the devil? If the devil is the prince of darkness, nitrogen must be the devil, for it extinguishes the light, and that is four-fifths of the atmosphere. Nitrogen extinguishes life as rapidly as it extinguishes flame. It is a deadly substance, yet it is necessary to life. No animal can exist, and no food can be rendered nutritious, without it. In respect to their polar characters, oxygen is positive and nitrogen negative.

Oxygen belongs to water as well as to air, and it combines with twice its own bulk of hydrogen to form water. Hydrogen is different from either of the other two; it extinguishes flame like nitrogen, but it burns itself: it steals the flame from the match. Thus in lighting a gas-burner you find that the hydrogen gas extinguishes the match, and catches the flame. Nitrogen would extinguish it, but would not burn; the light would instantly disappear. Oxygen will not burn, but it will cause the match to burn better. Here are three distinct natures; one causes to burn, another burns, and another extinguishes light, and creates total darkness. In respect to its polar character, hydrogen is negative—one positive and two negatives in the three. It is the opposition of these two natures that causes them to unite as they do. Two perfect negatives could only unite in warfare; they repel each other. It is not that close and intimate union which is analogous to love. Hence the origin of chemical affinities and aversions. It is all a system of love and hatred throughout universal Nature, which is all sexual from infinity to infinity. God is positive, the devil is negative, and *vice versa*. They cannot exist without each other.

In subjecting them to electrical influence, oxygen always arranges itself on the positive pole, and hydrogen on the negative. The metals all arrange themselves on the same side as hydrogen; chlorine, iodine, fluorine, &c., go to the positive, with oxygen. In fine, all Nature arranges itself on one or other of these two sides as determined by mankind or animals divide themselves into two sexes. Chemists frequently call oxygen negative, because it goes to the positive side, and hydrogen positive, because it goes to the negative. This is quite in character; for opposite extremes, like opposite sexes, seek each other.

These are modern discoveries; discoveries, not of this century only, but discoveries actually made since the accession of the present king to the British throne. The

discoveries of electro-chemistry are due in a great measure to Michael Faraday, Professor of Chemistry at the Royal Institution, whose splendid course of experimental lectures has afforded us the means of giving our readers a more accurate and scientific analysis of Nature than we could otherwise have done, although our doctrine was completely formed in our own mind at the latter end of 1828, exactly six years ago. But we do not profess to teach chemistry; we wish to direct the minds of our readers to a systematic study of Nature, which no public teacher has ever yet done, nor could do, because he had no systematic arrangement in his own mind, and therefore could not communicate it to others. This sexual, or positive and negative division of Nature, is of the utmost importance. Facts, systems, and theories are of no use without it, for there can be no judicious arrangement of principles except upon the fundamental law of all Nature—positive and negative, male and female properties. This law extends to mind as well as matter, and is the key to all the science of society, viz., politics and ecclesiastics.

LIGHT.

POSITIVE and negative light, or light and darkness, is a most mysterious subject of contemplation; its subtlety, its velocity, its intangibility, its imponderability, are quite confounding to the curious and philosophic mind. We can weigh air, we can weigh gas—but light, like an idea, or a mental abstraction, is beyond the jurisdiction of the balance. If you take the seven colours of the Newtonian spectrum, and paint a circular piece of paste-board with them in their relative proportions, you find these seven colours appear white when the circle is made to revolve with rapidity: but if you take these same seven colours in powders, and mix them together, they make black. In the first case the colours were in motion, in the second at rest. Motion and rest, then, correspond to light and darkness, as the positive and negative pole. This is the same as action and inaction.

Many ingenious theories have been formed respecting light. Huygens imagined that it consisted of an omnipresent fluid, or gaseous substance, which was set in motion by the chemical action of the sun as the positive pole. This corresponds with the above idea of motion and rest. Newton imagined that it consisted of a material substance emitted from the sun in straight lines. This corresponds with the phenomena of the motion of light; and the demonstrations of Newton and his disciples are unanswerable, so far as this motion is concerned. But then it is impossible for us to admit the idea of so continuous and rapid an influx of a material substance into the eye, without the least appearance of the vacuity being filled up. What becomes of this substance? No gas or fluid with which we are acquainted can continue to flow into the mouth of a vessel without filling the vessel, and thereby creating an interruption for itself. This objection applies equally as well to the theory of Huygens in its rude state, which supposes continued undulations of this omnipresent fluid to be continually entering the eye in a similar manner. This undulatory theory has,

however, undergone a refinement in modern times, by supposing a sort of electric action to be communicated from one particle of the fluid to another; so that instead of the fluid itself moving, it remains at rest, and the chemical action effects the illumination of nature by sympathy alone. What is all this but saying in other words that light is a spirit? What is action? Nothing at all. It is an abstract term, like love, hatred, imagination. It is neither air, earth, nor water, hydrogen, oxygen, nor carbon; but it is a relation or affection which is common to two or more of these substances at one and the same time. If action and reaction are not spiritual, they are material. If they are material, of what sort of stuff are they made? Chemical action is a spirit, and nothing else but a spirit; and that spirit is God, having two distinct properties or polar characters, a positive and negative; which two properties, by means of matter, multiply modes of action for themselves to infinity.

It is strange that the most infidel and atheistic portion of our *savans*, or men of science, should take the lead in introducing the real spirituality of these most subtle phenomena of Nature. Sir R. Phillips, who is far in advance upon many scientific subjects, though evidently chaotic in respect to the moving power of Nature, is decidedly of opinion that light is an effect, *not an entity*; that is, nothing at all, consequently immaterial. Of electricity he says, "All the confusion of electrical science has arisen from considering the cause *as an entity*, and not as an effect of action and reaction on other entities, and not merely an effect, but a relative effect; and in fact as two effects (positive and negative) always simultaneous and absolutely necessary." This is all that the enlightened spiritualist contends for—an acknowledgment of the immateriality of the cause and effect of nature; matter being only the instrument by which the immaterial cause and effect, or two opposite attributes, direct their movements and exchange relationships, each becoming positive and negative by turns.

Electricity, galvanism, magnetism, light, are all modifications of the same universal law of positive and negative action, presenting different phenomena merely because they act upon different substances. Electricity is produced by friction, galvanism by contact, magnetism resides at rest in certain species of iron, light acts in space unconnected with solid matter; and there can be little doubt but the very same cause produces all the other chemical effects of nature, which all invariably exhibit the same everlasting phenomena of positive and negative action. So that we thus reduce all science to these two fundamental bases, the two opposite extremes of universal almighty power, which is ever at work and never weary, the male and female Deity; viz. chemical action. There is no other action.

But what is light; is it a cause or an effect? It is both cause and effect; immaterial, yet acting with matter, to which it communicates its double properties, the light side of an object being the positive pole, the dark the negative. "Immaterial!" says the materialist, in astonishment; yes, but make it material if you will; but you never can have done with your reasoning until you come to a nonentity; as Sir Richard calls it. And what

is a nonentity? Why, it is a spirit, a mental power, which, although we cannot comprehend, we must either acknowledge as an axiom, or talk like fools; and that power is positive and negative, viz. GOD AND DEVIL, light and darkness; hence the Scriptures beautifully and philosophically define God to be the one extreme, the devil the other. "God is light;" the devil is the "prince of darkness."

Observe, however, how nicely the balance of Nature is kept up! the one excels in one thing, the other in another. Light reveals all the beauties of earth, but darkness reveals the wonders of the starry heavens. Light admits the vision of external nature, but the *mind* dwells in thick darkness, and illuminates itself with its own imaginings. Thus the sensual light is positive in admitting vision, the intellectual light is negative to receive it; but when it has received it, it becomes positive, reacts upon the system, and controls the whole man. This corresponds to our old law of the first and second step of Nature: the first is always inferior to the second; the first messiah is division, the second peace; so the first light is merely perception, which the brutes have as well as we; but the second light is reflection, which is preferred to his elder brother. "The Lord hath said he will dwell in the thick darkness," and so shall the mind for ever; but yet, in the days of regeneration, "the Lord shall be our everlasting light, and the days of our mourning shall be ended;" and so it shall be, for the mind is the true light, which enlighteneth the world, and creates the new heavens and the new earth, wherein dwelleth righteousness. "Who is a wise man, and he shall understand these things; prudent, and he shall know them; for the ways of the Lord are right, and the just shall walk in them, but transgressors shall fall therein."

From this it appears that the devil represents the mind; hence he is called the serpent; and the serpent is called the wisdom of God. "Be ye wise as serpents." And why is he called our enemy? Because, in a world of ignorance, during the inexperience of men, the mind is the greatest enemy of the species; it devises all the mischief: hence it is the author of evil. But the word says, "Satan is transformed into an angel of light;" the enemy shall then become a friend, and the world be no longer under a devil, but under a God.

PYRAMIDS, &c.

THE following is extracted from a work of private circulation by the late Humphrey Higgins, Esq. We give the whole without any comment at present, leaving our readers to form their own judgment upon the subject.

A learned orientalist of Cambridge, in a work called the "Cambridge Key to the Chronology of the Hindoos," has made some pertinent observations on the subject of a flood. The work of this gentleman is the best defence of the flood of Noah that I have seen. He shows that an immense flood was believed by all nations to have taken place, and he produces proofs, I think satisfactory, that in all of them traditions were nearly the same as to date, and that these traditions place it at or about A. M. 1656, of Usher's Chronology. His great object is to prove that the Mosaic history of the Patriarchs before

the flood is real history, and not a mythos, and he considers the proof of the existence of a general tradition of a flood, a proof of the truth of Noah's flood with all its details. But there may be a demur to this conclusion, even by persons who may admit most of the premises. Assuredly the circumstances and traditions, so generally found, furnish strong grounds for belief that some great flood did take place since the formation of the world and of man. But the reasons which I have given to prove that man has been created since the universal flood, which buried the last race of fossilized animals, seems to be satisfactory; therefore, the flood of which I now speak must have been of later date, and this later flood is what the priests of all religions have exaggerated into a universal deluge, burying the highest of our present mountains fifteen cubits deep. This flood may have taken place in the period of from about two to three thousand years before Christ. At this time the celebrated city of the great Bali, or Maha-Balipore, near Sadras, in India, may have been destroyed. Of this city the Cambridge Key says, "The stately palaces, august temples, and stupendous edifices, of this once-magnificent city, are universally believed by every Hindoo, whether learned or unlearned, to have been destroyed by 'a general deluge brought upon the earth by the immediate mandate of the Supremo God.' They still show the chasm in the rock, that forms one of the largest choultrys; and the divided sculpture but too plainly shows that nothing less than such a convulsion of nature could have rent so large a mass of solid stone, leaving the divided sculpture on each side the chasm,—evidently denoting that it was carved before the convulsion took place. This is a truth too apparent to be denied."

Here we have an argument worthy the consideration of a philosopher, and not far from being conclusive as to a very great convulsion, if the account given by the Key be not exaggerated. I wish this Indian scholar had been a little more full, and had told us that he had seen it himself, for I have a high opinion of his sincerity. It appears to me to be a place more worthy of careful examination than perhaps any other in the world.

The account given by this gentleman is, in general, confirmed by William Chambers, Esq., in the first volume of the Asiatic Transactions.

As I have just said, all this tends to prove that there really has been a very great convulsion since the creation of man, and the foolish exaggerations of priests are not enough to invalidate it, any more than the mythos spliced on to the history of ancient Rome, as satisfactorily shown by Niebuhr, is enough to prove that Rome did not exist. Few persons, except priests of very confined education, now believe the account of the flood literally, as expounded by devotees, but consider it, as they consider the texts which say that God wrestled with Jacob, and strove to kill Moses at an inn, *but failed*. The case is very difficult—but I am inclined to look upon the history of the flood, as Mr. Niebuhr shows that the early history of Rome ought to be considered; and that it is not a mere fable, but, on the contrary, that it has real history for its foundation—though disguised by the contrivance of priests, to excite astonishment in the minds of their votaries, or perhaps merely to conceal their secret doctrines.

We are told by Plato, that before the race of people who occupied Greece in his time lived, a previous race had been destroyed by a great flood. Now, I think it may be possible to find a probable cause for this effect; but I will previously make a few observations on the Pyramids and Delta of Egypt, from which I think we may, in our search, gain some assistance.

I shall, in the first place, give an extract from the work of a learned priest of the name of Gab, of the Romish church, which contains a statement of several curious and unobserved facts. He says, "But before I draw any further inferences from the discoveries, or perhaps I should say revival, of facts, (sunk, through the inattention of the learned, into a temporary oblivion,) now submitted to their consideration, by one who has little to boast of beyond taste and diligence in such a pursuit; I will hazard the experiment, and see what progress I can make in the investigation of the antiquity of this interesting monument, this paragon so replete with principles of science, the great Pyramid of Giza, or ancient Memphis.

"There appears no convincing reason to conclude the other pyramids to be coeval with this, as may be gathered from the sequel of the present discussion. I have before observed, that were I to hazard a conjecture of this pyramid being erected by the antediluvians, I should not want for arguments to bear me out. But if I have deceived myself, and should fail in this attempt, still the pyramid will neither fail, nor suffer any diminution of its beneficent utility in assisting in further discoveries.

"It has been a very prevailing, not to say a general, opinion, that the sands which environ the pyramid, and hide a great part of its reclining sides, next to the foundation, have been drifted by the winds from other parts of those regions, and lodged in the circuitous strata now seen on every side of it. A strange property, surely, must be imagined in those winds, thus invariably to combine their efforts to bury this stupendous monument of art, without ever taking back any part of their deposit. Strange, however, as it appears to me, it has been received by most writers and visitors of the pyramid, which opinion I now shall venture to combat. At the time Herodotus reported the length of the side of the base to be eight hundred feet (proved above to be of the standard chest, and equal to five hundred and eighty-three feet eight inches of ours), all will agree that he dug not, like the French of late, through the sands, in search of the exact length of the foundations of a pile, which he was led to believe to be a sepulchral monument, but only measured on the adventitious surface, and that probably to no great exactness, but thought a few feet of no such consequence as to spoil the round number of eight hundred, by inserting them.

Now, if the surface had continued to rise by the incessant arrival of sand; as, about two thousand years after Herodotus, Mr. Greaves, professor of astronomy, most accurately measured the side of the base also on the adventitious surface, he must have necessarily found, from two thousand years' accumulation of sand against the declining sides, a much less length of side than Herodotus records; whereas he made the length six hundred and ninety-three feet English, which exceeds it by one hundred and ten feet. And the learned admit that we may depend on the veracity of Herodotus in such matters as fell under his cognizance; and who can deny Mr. Greaves an equal character? This inference, then, may fairly be drawn, that the winds in those regions have been imperceptibly stripping the sand-covered sides of this pyramid, for at least two thousand years, instead of increasing the accumulation. This conclusion, however, rests not entirely on the accuracy of these stated dimensions. The argument is supported by these further considerations.

"All who have written on the pyramids, agree in one point, though scarce any two in many others, that the sands which cover the surface of the rock, and are ac-

accumulated about the sides of the pyramids, are adventitious. But by what agency, is the question? Most have taken it for granted, without further investigation, they have been brought by the winds; and indeed we read of wonderful effects thus produced in those regions of the earth—as tremendous columns of sand, raised by the impetuous whirlwinds, to the great terror of the alarmed travellers; but where do we read of these phenomena becoming stationary even for a day? Common observation teaches us, that fine sands and pulverized earth are invariably driven by the wind from higher grounds and summits, and lodged in vales. All readers and travellers know the surface whereon the pyramid stands, is the summit of an extensive rising ground or covered rock, at a sufficient distance from the mountains of Lybia to give the wind free access to the site whereon the pyramid is built. And it is directly contrary to common experience to attribute that deposit of sand to the agency of the wind, since the removal of it is rather the natural and invariable effect of that agitated element. And that this has been the case with the sands deposited about the pyramid, the greater altitude of them at the time of Herodotus, and the less altitude when Mr. Greaves visited the pyramid, seems to be a proof, wanting nothing but accuracy in their statements to be a demonstration; and though no man is infallible, can it be reasonable to argue two such reputable characters, as Greaves and Herodotus, could either of them, in so short a length, as at most one stadium or furlong, have deviated from the other and from truth, by one hundred and ten feet?

“But if this deposit of sand is not the effect of the winds, by what agency came it there? Not by any extraordinary overflowing of the Nile, from which a sediment might be left; for it is known, that river never rose to near the height of that plain of rock, nor are there any kind of shell-fish in the Nile; whereas shells and petrified oysters are found in the sands about the pyramids.

“And it must be allowed, when this pyramid of Giza was built, there were no such depths either of sands or of earth upon the rock, as in the time of Herodotus, from the absurdities that would follow such a supposition—since the builders must first have dug out their depth of sand equal in extent to twelve English acres; and when their work was completed, must be argued to have filled in, against the declining sides, to the level of the former surface, and thus have buried a considerable part of their own work.

“From these positions, it evidently appears, this pyramid must have been erected by the antediluvians before the universal deluge, called Noah’s flood, and the description given of it in Holy Writ will account in a satisfactory manner for the lodgment of sands on the surface of that extensive rock.

“It is natural to conclude the heavier particles of sand, when the waters became tranquil, would sink first, and the lighter particles, of course, both on account of their texture as well as their more exposed situation, would easily pulverize, and be sooner conveyed by the winds to distant places, than the ponderous, compressed layers, intermixed with shells and portions of loam, which more immediately covered the sides of the pyramid nearer the rock. Of course the reduction of this consolidated mass has been by slow degrees, and its dispersion by the winds so imperceptible as to defeat observation.”

Herodotus stated the length of the side to be about 600 feet, of our measure about 583 feet; Mr. Greaves states it to be 693 feet English, or 110 feet more. The French

found the base of the pyramid 31 feet below the surface; now, taking the area at eight acres, the builders must have removed 611,177 cubic yards to lay the foundation. And if Herodotus’s account be taken, of the less height of the pyramid and increased depth of sand, it would be 3,745,928 yards. The French found Mr. Greaves’s measurement correct.

“INDIVIDUALISM.—Make it a rule of life—lay it down as a principle, to shun the company of entomologists. An entomologist is a man of caterpillars, fleas, and earwigs—one whose heart is set upon midges, and to whom a cricket is the noblest animal in creation. What disgusts every body else constitutes this individual’s supreme happiness; all that crawls, creeps, buzzes, or stings, throws him into raptures. His sympathies are with reptiles of all the kingdoms of the earth; he cares for the insect kingdom alone. Of the dynasty of the earth, he knows the whole animals, the chronicles of a wasp’s nest are far better known to him than the history of England; he viewed the progress of the Reform Bill with the most complete indifference, but not the slightest mutation in the social policy of a bee-hive ever happened without his privacy. Was there to be an ant-hill revolution, he would be a very great man. Of all the creations of the sixth day, the only one he admires is that of the creeping things. Had he lived in Egypt during the plague of lice and frogs, he would have thought it elysium. He is a fellow who would turn from Cleopatra to her asp; and prefer a mosquito, or a grasshopper, to all the beauties that ever bewitched mankind. He would give the two eyes of Venus for the tail of a glow-worm, and all the roses in Paphos for a canker in one of the buds.

[Such characters are useful in the economy of nature, for collecting “facts,”—insulated facts; but they do not generalise or study universal truths. It takes a vast number of Individualists to make a Universalist. Hence in the progress of nature the Individualists are the forerunners of Universalists; and the old world is at an end when the facts of Individualism are collected into a focus and constitute Universalism.]

“TYRANNY OF JUSTICE.—If a wife elope from her husband, and live in adultery, the husband cannot be charged by her contracts. And although the husband was the aggressor, by living in adultery with another woman; and although he turned his wife out of doors when there was no imputation on her conduct, yet if she afterwards commit adultery he is not bound to receive or support her.—*Laws of England.*

MR. SMITH will lecture on Sunday evening next, at 7 o’clock, at 36, Castle-street East, Oxford Market. Admission Threepence; Ladies Free.

CORRESPONDENTS.

The Alpine Philosopher’s manuscripts puzzle the compositors sadly.
The extract from Augustus Toplady we shall probably use next week.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln’s-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Brady, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 21.]

SATURDAY, JANUARY 17, 1835.

[Price 1d.]

SYSTEM OF NATURE.

LAST week we demonstrated the positive and negative doctrine of redemption; this week we shall handle in the same brief and concise manner the double doctrine of sacrifice for sin.

What are the positive and negative doctrines?

The positive doctrine of the old world is, in the words of St. Paul—"Without the shedding of blood there is no remission of sins." "The blood," says Moses, "shall be an atonement for you." "All things under the law are cleansed with blood." What is the meaning of this? It is a hieroglyph or emblem of the character of the old world, which cannot be tranquillized or governed without frequent blood-letting. Being yet individualized both in respect to property and opinions, there can be no system of unanimity or co-operation established amongst men. Nations, sects, parties, families, individuals, must therefore live in everlasting jealousy; the balance of power must frequently be destroyed by the encroachments and machinations of one against the other, and as reason is a useless mediator between them, the sword must usurp the place of reason until the latter has arrived to manhood and discretion. Thus the whip and rod keep the child in subjection until his mind becomes a fit tribunal before which truth and error can stand. What is the use of reasoning with a brute? and what is man in ignorance, but a brute? The old world is therefore purified with blood. All its feverish excitements are allayed by opening the veins of society, and sacrificing a few for the preservation of all. Thus all the religions of the world, which are merely a running type of the progress of society, beautifully developed this simple and undeniable truth, by pouring out the blood of *beasts* unto God. Whilst the type was thus innocently carried on by the priests, mankind were practicing the prototype in the fierce and destructive scenes of carnage which characterize the history of the rude ages.

During those times of physical action the mind was little employed. The glory of the individual, like the glory of the brute, consisted in his muscular strength and activity. The little learning that did exist was confined to the priesthood, and that took no lead in, and exercised no control over, the administration of public affairs. But no sooner had the Grecian philosophers popularized the pursuits of abstract philosophy, and thus enlarged the sphere of priestly influence by communicating a metaphysical genius to the public mind, and the time was come for diffusing this new intellectual propen-

sity over all the world of progress, than a new idea was suggested by Nature, corresponding to the bloody work of devastation which the first metaphysical enquiries of her creatures must necessarily create. *Beasts'* blood must now be foregone, and better blood than that of bulls and goats must be held up as the atonement for sin. Men are no longer mere brutes when they begin to reason on abstract ideas: but this reasoning, intellectual as it is, as long as ignorance remains, and nature is veiled, cannot tranquillize the movements of society. Blood, therefore, must still be shed—there is no alternative; final truth has not come, divisions exist, collisions must take place; reason cannot yet decide; the sword must occupy the throne of judgment; the patient must be bled—but it is man's blood that is now shed: for the species have begun to think. Foolish as their first thoughts are, still they are intellectual abstractions, which will come to maturity and consistency at last.

Sacrifice, therefore, now assumes a new form: the blood of bulls and goats is no longer poured out unto God; but, what is much more fearful to relate, we are told that he requires the blood of man. This era commenced and assumed a systematic form with Jesus Christ, and the shedding of his blood, as a leading type and representation of all those who should attempt to carry on the progress of religion until the time of the end. Therefore, he told his disciples that they should drink the same bitter cup as himself, and they told their disciples that nothing was in reservation for them in this world but persecution until the days of reformation. Formerly the blood of man was shed almost exclusively for political considerations; now the system of bloodshed was applied to the settlement of metaphysical questions. It was commenced by the heathen Romans, in their attempts to extinguish the rising spirit of Christianity at its first appearance; and then it was pursued with greater cruelty and infatuation by the Christians themselves, in the vain expectation of restoring tranquillity by means of physical usurpation and authority.

Political bloodshed is the blood of the beast, for it is shed as one beast's blood is shed by another, for animal support and sensual gratification; but religious bloodshed is the blood of man, as it is shed for opinion, a metaphysical abstraction which a beast is incapable of apprehending. Every church in Christendom has been established upon blood; and even now, our own dear spiritual grandmother, the Protestant Church of England, is quietly contemplating the barbarous and inhuman murders committed by her ministers and dignitaries in Ireland; thus participating in all the guilt of the crime, and

branding her forehead at the very end of her existence with the accursed name of *murderer*. A similar spirit exists amongst all parties, which is only modified by external circumstances; amongst all there are deadly hatreds, fearful prejudices, contemptuous feelings, implacable hostilities, which, if now prevented from manifesting themselves in deeds of blood, are still guilty of the crime of murder. "Ye have heard that it was said by them of old time, Thou shalt not kill; but I say unto you, that whosoever is angry with his brother, without a cause, or says unto him 'thou fool,' shall be in danger of hell fire."

Such is the history of the sacrifices of blood; and we have no doubt that all our readers will acknowledge that, until the human mind is enlightened, there is no other remedy for the outrages and grosser evils of society than blood-letting. "All things under the law are purged with blood; and without the shedding of blood there is no remission."

So much for the *old* world; now let us reverse the picture, and look at the negative doctrine. "Wherewith shall I come before the Lord, and bow myself before the most high God? Shall I come before him with burnt offerings, with calves of a year old? Will the Lord be pleased with thousands of rams, or ten thousand rivers of oil? Shall I give my first-born for my transgression, the fruit of my body for the sin of my soul? He hath showed thee, O man, what is good, and what doth the Lord require of thee but *to do justly, to love mercy, and walk humbly before thy God.*" (Micah. vi. 6). "I will not reprove thee for thy sacrifices or thy burnt offerings; I will take no bullock out of thy house, nor he-goats out of thy folds: will I eat the flesh of bulls, or drink the blood of goats? What hast thou to do to declare my statutes, or take my covenant in thy mouth, seeing thou hatest instruction, and castest my words behind thee? Thou givest thy mouth to evil, and thy mouth frameth deceit." "Sacrifice and offering thou didst not desire; burnt-offering and sin-offering hast thou not required. Then said I, 'lo, I come to do thy will, O God, yea, thy law is within my heart.'" It is evident then that the sacrifices of blood are useless; they do not reform the heart: they may produce a forced and artificial state of repose; by overawing the weaker party into subjection to the strong; but the party subdued only occupies itself with schemes of reaction, and takes the first opportunity of retaliation. The only sacrifice which can be useful to the world is the sacrifice of error and immorality, the spirit of the old world.

St. Paul attempts to reason his disciples into a belief that the body and blood of the man Christ was the real and effectual sacrifice for sin. He knew no better, and he acted right in so doing; because the human mind had not progressed far enough to make or even understand any other sacrifice; but he made a considerable step in advance, by proving that Moses' sacrifices were not final and effectual, because they did not take away sin after being tried for several generations. The same argument now applies to his own doctrine, for neither the blood of bulls nor of men has been found of any use. The crisis of spiritual reformation is at hand, and it is clear that

another species of sacrifice is a-wanting—a spiritual sacrifice—a sacrifice of a false principle of public instruction, public morals, and religion. This reverses the thing entirely; we now find ourselves on the opposite pole; the former was *material* blood—the latter is *spiritual* blood.

This suggests a new idea entirely; the idea of the superiority of mind over matter, which has been formally and nominally acknowledged by the old world, but has never been practically or even theoretically adhered to. If adhered to, how does it happen that so much importance has been attached to the literal blood of Christ, that material or animal blood has been regarded as the purifier of the conscience? What analogy is there in nature to demonstrate such an absurdity—and what foundation is there in fact to corroborate it? And moreover, what authority is there in Scripture to countenance it?

We think we hear an exulting laugh on the part of the pious Christian of the old school, at this last question; we imagine we hear him quoting St. Paul and others, to prove that we enter into the holiest of all by the *blood* of Christ, and by the rent veil of the *body* of Christ, and triumphantly inquiring if these be not authority—forgetting that the very same authority is to be found in the Pentateuch for the calves' blood of Moses. Does he not know that we have the same authority for saying that, except we eat the flesh and drink the blood of Christ, we have no life in us; that in fact we cannot be saved unless we eat the Saviour—"he that eateth me shall live by me." If this is the literal flesh that is meant, then we must all be damned together—there is no hope left—unless the doctrine of transubstantiation be literally correct. What then is the meaning of the flesh and blood of the son of man? It is the *spirit* of man, which is two-fold; the first character or nature is *evil*, and is sacrificed for sin; the second is *good*, and is *eaten* or *imbibed* for the salvation of the world. Thus Christ, the representative of the twofold spirit of Nature, has two distinct natures—a human and divine; one is destroyed, the other is glorified. Nothing can be more beautiful than the type, nothing more evident and more strictly philosophical than its meaning; but it attaches no virtue whatsoever to the shedding of material blood. "I am the living bread, which cometh down from heaven; if any man eat of this bread he shall live for ever; and the bread that I will give is my flesh, which I will give for the life of the world;" and immediately after he adds, "It is the *spirit* that quickeneth, the flesh profiteth nothing; the words that I speak unto you, they are spirit and they are life." Yet the foolish creatures of the present generation imagine that it is the *real material solid flesh and blood* which are the sacrifice for sin!!!—Christian materialism!

Well, they have got a pretty fair trial of this sacrifice for 1800 years, and a miserable plight it has brought them into. They are not dreaming of any other, nor do they believe it possible that any other could be made; they adhere as faithfully to their human blood as the Jews did to their calves' blood. And now it is a fair question between us and them, whether it is the blood of the body or the blood of the mind that requires to be shed at last. We say, the blood of the mind; that is, of the old man or

old world; namely, a false foundation of doctrine, which leads to a false superstructure in religion and politics.

The priests and Christians, both clerical and lay, have *carnalized* the Word. They have worshipped flesh and blood. And yet so contemptuously doth the word speak of this flesh and blood, that it says it cannot inherit the kingdom of God. Yet this very thing, which cannot inherit the kingdom of God, is declared by the priests to be the lamb without spot and blemish, which men must eat and drink before they can be saved!

The true Christ is the spirit of the old world, and the spirit of the new; the positive and negative. They must exchange places; that which is last must be first, and the first last. The flesh has been superior to the mind, now the mind must be superior to the flesh. Christ must be spiritualized; his flesh must be destroyed, and all the doctrine connected with it must be crucified along with it. The spirit must be preserved and glorified. This is the true and final sacrifice for sin, which as soon as it is made will unite the minds of men, make an end of sin, and bring in everlasting righteousness.

THE SHEPHERD.

NATURE.

THE whole of material nature may be divided into gases, liquids, and solids; but there are other divisions introduced by modern chemistry of a more refined nature, which we shall briefly explain: gases, metals, acids, alkalis, earths, oxides, and minerals.

The most universal, if not omnipresent gases, are oxygen, hydrogen, and nitrogen, which compose the two elements of earth and water. Oxygen has a greater attraction for hydrogen than nitrogen, so that a compound of hydrogen and nitrogen (*hartshorn*) is easily decomposed by oxygen, which absorbs the hydrogen, forms water, and leaves the nitrogen. Thus our air and water are formed by the balance of power between the three. A pure gas has neither taste nor smell, and is invisible.

Metals are merely combinations of the gases with an earthy base, a species of alkali; they have a great affinity for oxygen, which causes the rust that usually gathers around them. The rust of iron is occasioned by the union of the oxygen of the atmosphere or the water with the metallic base. There are three metals which are less disposed to oxidise, or rust, than the rest,—namely, platinum, gold, and silver. This gives them an especial value, and entitles them to the distinction of the name of "precious metals." This peculiarity renders them extremely useful for chemical purposes; but as Nature has not made them suitable for the common purposes of art, she has made them very scarce; they are like genius in society, only fitted for refined and special purposes. Manganese, iron, pewter, and zinc, absorb and retain oxygen at all temperatures.

Acids are bodies, fluids, or gases, which have a sharp sour taste, occasioned by the principle of activity, acting as the positive pole to

Alkalis, which are the negative or reverse of acids. The two natures neutralise each other: an acid neutralises the taste of an alkali, and an alkali of an acid. If a

vegetable colour is destroyed by an acid, an alkali restores it, and *vice versâ*: they combine with acids and form salts; the most part are metallic oxides.

Earths are generally regarded as metallic oxides, devoid of acidity or alkalinity; that is, in a state of quiescence. A pure earth is neither acid nor alkali; but some that are called earths have the properties of alkalis in their affinity for acids.

Oxides are merely metallic bases in union with oxygen; the difference between them and earths is, that the oxides are easily decomposed, the earths are not. A pure oxide is neither acid nor alkaline.

Minerals are compounds which embrace the remainder of Nature, such as salts, stones, and rocks; but they are nothing else than different combinations of gases with earthy bases.

What are called simple bodies are those which cannot be decomposed, and are therefore considered as elementary substances, such as sulphur, phosphorus, gold, &c.; but they are evidently composites, which have not yet been resolved into their primary ingredients.

Now, taking a general view of this division of Nature, it is evident that it is all resolvable into two or three divisions. An oxide is nothing but a substance combined with oxygen in such proportion as to become *neutral*—neither positive nor negative: a pure earth is either a total deficiency of gas, or a neutrality of the positive and negative gases, effected in such a manner that the art of the chemist cannot disunite them. The acid and the alkali are the two leading divisions, which contain the positive and negative characters in unequal proportions, so as to act with vigour. These two properties are occasioned by two gaseous substances, either in union with a simple base called carbon, or forming that base by their own combination, as the two invisible gases. Oxygen and hydrogen form solid ice, which we may easily imagine converted into diamond. Thus all Nature resolves itself into an invisible, impalpable gas with two polar characters.

And pray what is a gas? *Matter*? Prove it to be matter if you can. Chemists inform us that *matter* must be composed of atoms; and consequently gas is a collection of small atoms. They also inform us that these atoms do not touch each other, because the gas can be compressed and expanded, like steam, into smaller and greater bulk: heat expands, and cold contracts it. There must therefore exist between these atoms a power to approximate and separate them. This power is not matter, for it exists *between* the atoms of matter; but it is stronger than the matter; and if stronger, it must be more solid than the matter, because the atoms cannot resist it. There is therefore in Nature a power which is stronger and more solid than matter itself; for it contracts and distends as it pleases, and matter cannot resist it. Query, is there such a thing as an atom? Is not what we call matter merely a modification of this omnipresent power, resulting from the union of its twofold nature? Chemistry cannot solve this question; for, singular to tell, although it can demonstrate that every thing in Nature is or may be composed of gas, it cannot demonstrate that gas is *material*, and all the theories which are built upon

the supposition of the materiality of gas are incomprehensible and absurd. True it is that gas can be weighed, and is subject to gravitation, compression, &c. But gravitation itself is one of the most spiritual abstractions which we can express. There is gravitation in mind as well as in matter. Love is gravitation, being a strong inclination of the thoughts of the mind to a particular object or subject; and it is just as easy to conceive an idea (as in dreams) solidified into matter, as gas solidified into ice or diamond, or made up of small particles which never touch each other, yet are bound together by an irresistible power which resides between the particles, and separates or approximates them at will. Is not Nature a mystery, when even the *primary* existence of matter is only a theory? They build their house upon the sand who lay the foundations of philosophy in positive materialism; for what are atoms but sand? and these atoms must be inferior to the power that binds them. But if matter has not a primary; it has a secondary existence; just as water has not a primary, but a secondary existence, by the combination of gases.

SINGING, STAMMERING, DUMBNESS, AND VENTRILOQUISM.

WHATEVER Rousseau may have said in his Dictionary of Music, singing may be regarded as the most natural expression of the emotions of the soul, since the least civilized nations so use it, in their songs of war and love, of joy and mourning; and, as every affection of the mind modifies, in some way, the voice, music, which is only imitated song, can, by the aid of sounds, paint love or rage, sadness or joy, fear or desire, can produce the emotions of these different states, can thus sway the course of our ideas, and direct, at pleasure, the operations of the understanding, and the acts of the will. Of all the instruments which this art employs, the vocal organ of man is, indisputably, the most perfect, that from which the most agreeable combinations and the most varied may be obtained. Who is there that knows not the property of the human voice to lend itself to all accents, and to imitate all languages? I will observe, on the occasion of song, that it is especially consecrated to the expression of tender sentiments or movements of passion, and that it is turning it aside from its natural or primitive destination, to employ it in situations where no emotion can be supposed. It is this that makes the recitative of our operas so intolerably tiresome, and throws such ludicrousness over dialogues where the speakers converse singing on the most indifferent matters. Languages abounding in vowels are thereby fitted to song, and favour the growth of musical genius. It is perhaps their smooth and sonorous language that has given to the music of the Italians its superiority over that of other countries. The declamation of the ancients was much more removed than our own from the common tone of conversation, approached nearer to music, and might be noted like real song.

The pleasantness, the precision of the voice, the extent and variety of inflexions of which it is capable, depend on the good conformation of its organs, on the flexibility of the glottis, the elasticity of the cartilages,

the particular disposition of the different parts of the mouth and nasal canals, &c. It would be enough that the two halves of the larynx, or the two nasal canals, were unequally developed to prevent precision and distinctness of voice.

Stammering is a vice of pronunciation too well known to make it necessary to define it. A tongue too bulky and thick,—a remarkable diminution of irritability, as in drunkenness, at the approach of apoplexy, and in certain fevers of a malignant kind,—the too great length of the frænum of the tongue,—by hindering the readiness and ease of its motions, become causes of stammering. Or it may be produced by the want or bad arrangement of several teeth. The same causes, but especially the length of the frænum of the tongue, keep down this organ against the lower paries of the mouth, and hinder its point from striking the anterior part of the roof of the mouth with the quick stroke, requisite for the pronunciation of the letter R. The name of *burr* is given to this defect of speaking.

As for dumbness, it may be either accidental or from birth. When by any accident, as from a gun-shot wound, a cancerous tumour which has rendered necessary the extirpation of part of the tongue, that organ, so far destroyed, is no longer able to apply itself to the different parts of the parietes of the mouth and combine its motions with those of the lips, then the person becomes dumb, that is to say, deprived of speech. He has still voice, or the faculty of uttering sounds: he may even articulate, if he supply, by mechanical means, the parts of the tongue, lips, or roof, the want of which hinders his pronunciation.

It is not so with the dumb from birth. Frequently, all parts of the mouth are perfect in their conformation, and yet the child cannot attain to speech. Such is the case of a little boy of three years and a half old, who has been brought to me, to divide his frænum lingue. Sometimes, however, the tongue adheres to the lower part of the mouth, because the internal membrane of that cavity is reflected over its upper surface long before it reaches the middle line of the inferior surface. In other cases, the edges of the tongue adheres to the gums.

Sometimes, also, the tongue is really paralytic; such was the case of the son of Cræsus, whose wonderful story is related by Herodotus.

In the deaf and dumb from birth, the dumbness always arises from the deafness; this, at least, is what M. Sicard has observed in the great number of pupils committed to his care; which has led him to say, that, in them, the want of speech should bear the name, not of dumbness, but of silence. It is owing entirely to the absolute ignorance of sounds, and of their force represented by the letters of the alphabet; the organs of voice show no trace of injury; they are well fitted for fulfilling the purposes to which they were allotted by nature: but they remain inactive because the deaf child cannot be taught to use them.

It was necessary, therefore, as the ear was closed, to address to other senses the speech he must endeavour to imitate. His eye must be made to watch the motions of the lips and the tongue; his hand to feel the vibrations,

and the utterance of sound; and thence he must learn to use his organs of speech: this has been done. What Pereira had begun, Sicard has brought to perfection: and such command of articulate sounds has been given to the deaf and dumb by birth, as has enabled them to utter words, and connected discourse. Even something of inflexion of strong and weaker tones has been taught them by using the arm as a regulator, as pedals are employed to modify the touches of the piano-forte.

But instruction to the deaf and dumb must be given them by another language. Written language they learn, not as a representative of speech, but as hieroglyphic characters for ideas: and a manual language, in which each letter is expressed by the position of the fingers or hands, is used as a more convenient and rapid representation of that hieroglyphic language of written characters. It is by this that conversation with them is best carried on; and it is with an ease and rapidity which astonishes those who for the first time are witnesses to the use of it.

To conclude this chapter, I have still to speak of a phenomenon, well worthy, by its singularity, of the attention of physiologists. It is known under the name of *ventriloquism*, because the voice weak, and little sonorous, appears to issue from the stomach. There is now living, at the quondam Palais-Royal, at the coffee-house de la Grotte, a man, who can carry on a dialogue so naturally, that you would think you were listening to the conversation of two people, at some distance from one another, and quite different in voice and tone. I have observed that he is not inspiring while he speaks from his belly, but that less air comes from his mouth and nostrils than in his ordinary speaking. Every time that he does so, he finds a swelling in the epigastric region; sometimes he feels wind moving lower down, and cannot go on long together without fatigue.

I had at first conjectured that, in this man, a great part of the air driven out by expiration, did not issue from the mouth and nasal fosse, but that, being swallowed and carried down into the stomach, it struck against some part of the digestive tube, and produced a real echo; but having since observed, with the greatest care, this curious phenomenon in M. Fitz-James, who exhibits it in the highest perfection, I have satisfied myself that the name of *ventriloquism* no way suits it; since its whole mechanism consists in a slow, gradual, attenuated, expiration, whether for that purpose the artist employ the power of the will upon the muscles of the parietes of the chest, or whether he hold the epiglottis slightly lowered, by means of the root of the tongue, of which he scarcely brings the point beyond the dental arches.

I find this long expiration always preceded by a strong inspiration, by means of which he introduces into his lungs a large quantity of air, of which he afterwards husband the use. Accordingly, repletion of the stomach is a great hinderance to the action of M. Fitz-James, by preventing the descent of the diaphragm which the chest would require to dilate itself for the full quantity of air the lungs should receive.

By accelerating or retarding expiration, he can imitate different voices, make it seem that the speakers in a dialogue, which he carries on by himself, stand at different

distances, and produce illusion the more complete, the more perfect is his talent. No one equals M. Fitz-James in the art of deceiving, in this respect, the most wary and suspicious observer.

He can set his organ to five or six different tones, pass rapidly from one to the other, as he does when he represents a very eager discussion in a popular society of the people, imitate the sound of a bell, and carry on, singly, a conversation, in which one might think that several persons of different ages and sexes were taking parts. But what completes the illusion, and especially distinguishes the art of the ventriloquist from that of the mimic, who can only counterfeit, consists in the power of so modulating his voice that one is deceived as to the distance of the speaker, in such sort that one voice comes from the street, another from a neighbouring apartment, that from one that had clambered up the roof of the house, &c. It is easy to discern the value of such a talent in the days of oracles. — *Richerand's Physiology.*

A CLERICAL LABYRINTH.

TO THE EDITOR OF THE SHEPHERD.

SIR,—The following extract from a tract by the Rev. Augustus Toplady, A. B., on the existence of devils, is so much in point with your System of Nature, that I have taken the liberty of sending it to you.

“Should it be asked, ‘How came any part of those angels, who were created in such a state of natural and moral excellence, to make shipwreck of their holiness, of their majesty, and of their joy?’ I answer, that the origin of evil, whether among angels (with whom evil seems strictly to have originated), or among men, is the most difficult question, perhaps, and the most mysterious part of the *Divine conduct*, that ever yet presented itself to human investigation. Clouds and darkness are the seat of its residence, though *wisdom, goodness, and justice*, were certainly (in a manner unknown to us) the motives to its permission. It becomes us, probably, on such an occasion as this, to repress the sallies of imagination, and to clip the wings of idle curiosity. It may be, that we cannot answer the question in better words than in those of our Lord, ‘Even so, Father; for so it seemed good in thy sight.’ We may, perhaps, venture to surmise that, according to our present views and apprehensions of things, the divine perfections could not have been manifested in equal glory, and to equal advantage, if nothing but absolute and uniform good had universally and immutably prevailed. I was greatly pleased, some days ago, with the remark of a pious and learned friend, who, in the course of our free conversation on this subject, observed that ‘Had evil never been permitted, how could the justice of God have been glorified in punishing it? How could the wisdom of God have been displayed in overruling it? How could the goodness of God have been manifested in pardoning and forgiving it? And how could the power of God have been exerted in subduing it?’ Here, probably, is our *ne plus ultra* on this subject; until we ripen into that fulness of knowledge which awaits us at God’s right hand, until our dis-imprisoned spirits rise into a superior state, it becomes us to confess our ignorance and incompetency, and to ad-

dress the uncreated cause of all things in the language of (I think) good Bishop Hooper, a few moments before his martyrdom, 'Lord, I am darkness, but thou art light!'—Yours, &c.

A MEMBER OF THE SOCIETY OF
FREE ENQUIRERS.

[Such is a pretty fair specimen of clerical ignorance. Yet these men pretend to teach others.—“When the blind lead the blind, they both fall into the ditch.” Those who read the *Shepherd* cannot be much puzzled with this great clerical puzzle of the origin of evil. What an idea! to create evil in order to show his *justice* in burning for ever those who follow this evil! and how inconsistent with the other idea of creating or permitting it, in order to show his mercy in pardoning it!! It is a pure specimen of old theology, and does not require a special reply. Our readers will soon learn to dissect all these subjects in a scientific and conclusive manner.—ED.]

LETTERS ON TELLURISM, COMMONLY
CALLED ANIMAL MAGNETISM.

LETTER IV.

It is the general custom of authors to introduce their works to the notice of the public, wrapped up in a long robe, called preface. Therein the authors are like the Egyptian high priests, who, in order to secure an everlasting duration to their mummies, after having spiced, pickled, and fumigated the bodies, wound whole pieces of linen around the royal relics. In a similar way, a friend of ours has written a book of 552 pages, of which only 446 are preface, which I was tempted to compare with the tail of a comet, the kernel of which, according to modern astronomers, is nothing but condensed gas.

But I do not mean to disparage the authors of long prefaces, nor to nullify the author of the longest one. That would be the same as if I was silly enough to criticise Nature, the law of which is infinite variety of forms and structures. I am telling a mere fact, for which I claim for myself the privilege of interrupting the dogmatical course of my letters, and to request my readers to consider them as a kind of preface. I dislike sameness; indeed, were I obliged to live in a world where all human beings were cast in one mould, either after the spiritual pattern of the Platonic school, or after the material model of ancient or modern Epicureans, methinks I might be tempted to imitate the example of some love-sick heroes of modern romance, and hang myself for mere ennui.

But happily, the world is not, and will never be, such as the *one-sided* fools fancy to make it. Sameness is contrary to the eternal laws of Nature, that delights in variety, and has made the bipolar principle the basis of advancement and progressiveness. Beauty, virtue, truth, happiness, all after which mankind is striving, are like unto a masterpiece of musical genius; instead of being the eternal unison of the same note, they are the variation of seven notes, of flats and sharps, of quick and slow movements and expressions,—where the soft flute and the noisy trumpet, the merry violin, the manly oboe, the time-keeping violoncello and bassoon, and all other string and wind instruments, reveal each in their kind

a progressive musical composition, and form a whole of heavenly harmony. For him who has no music in his heart, these observations are lost; but I hope they will not be lost for the readers of the *Shepherd*! because how would they otherwise be able to understand the science of the Harmony of Nature?

My former letters are but the preface of the present one, and of the whole series of those in which I shall continue to converse with our readers, whom I wish to tease and puzzle, in order to call forth some observation! What? Have I not succeeded in a puzzling a compositor? Why should I not succeed in puzzling any of our readers? I will try it.

The religious and historical writings of the Jews, and of all eastern nations, those of the Greek and Romans, those of the German nations, are all relating facts, which have been rejected by our contemporaries as mere inventions of designing hypocrites, or deplorable illusions of deluded believers.

Such facts are, for instance, the healing of diseases by the mere manipulation of the prophets, or by the strong belief of the patient; the prophetic dreams, the prophecies, or the witchcraft. For instance, we read in the Bible of the wonderful restoration to life of a youth by the prophet, of the restoration of sight of Tobias by the angel; we are informed by the historian that the Egyptian priests brought their sick into the temples, where they fell asleep, and during the sleep the gods revealed the remedies for their diseases. The Emperor Hadrian cured blindness; and no less a man than Tacitus relates that the Emperor Vespasian healed blind and lame people by manipulation (imposition of hands).

Apollonius of Tyana performed as many and as wonderful cures as any recorded in the New Testament. The Jewish sect of the Essenes possessed also the power of healing diseases by manipulation. The dissenters of the primitive Christian church, called the Montanists, from Montanus, performed also many wonderful cures; indeed these cures were so striking, that one of the fathers of the church became an apostate, seduced by the magical cures of these dissenters.

The records of witchcraft are coeval with the history of mankind. There is no nation without prophets, and prophetic dreams; none without wonders and wonderful cures.

Now, I say in the teeth of all philosophers, that these facts are true. Witchcraft and divination, the power of healing by manipulation, and by the force of the will and of the belief, are as indisputable as the phenomena of galvanism and electricity.

Animal magnetism has discovered this hidden part of nature, and has elevated to a science that which, being hitherto practised by mere instinct, has justly deserved the name of superstition. In fact, superstition is but the negative pole of religion, and religion is but the negative pole of science.

Gentle readers, keep the bipolar law of nature steadfastly in your minds; let it be the compass that guides your ship on the voyage of discovery, and you will reach the heavenly shore of truth.

THE ALPINE PHILOSOPHER.

THE TWO EXTREMES OF PROGRESS.

It is essential to the proper understanding of the science of progress, to have some clear idea of its last movements, which of course must be twofold, positive and negative. It has evidently run through Jewism, Eastern Christianity, Popery, Protestantism, where it ends in a national point of view. But it has a sectarian as well as a national character, and that sectarian character comprises both faith and infidelity. Infidelity was formerly merely a different species of faith; now it has come to a pure rejection of the doctrine of a deity, and ended in atheism, or materialism. This is the end of infidelity. Faith has taken a different course, and, glowing with the hope of the fulfilment of the promises, anticipates the speedy termination of injustice in the promised coming of Christ to judge the world. But there is one sect in particular above all others, which contemplates this glorious subject, and makes it the leading feature of its doctrine and faith, namely, the Southcottian church, which, although miserably divided, like the rest of Christianity, is all united upon the main point of the speedy approach of the great deliverer. This church is also peculiarly distinct from all others, inasmuch as it combines in itself alone all the peculiarities of religious faith, being the only church in existence which is professedly led by living prophets, who carry on the progress of mind by revealing new truths, and throwing new light upon old doctrines. In fine, it is the only church of progress in Christendom that we know of, and therefore we have no hesitation in placing it at the end of the line of progress. If any of our readers can point out another, we shall be exceedingly obliged to them. Southcottianism and atheism are therefore the two feet of the old world, supposing it to have descended; and the two brains, the cerebellum and cerebrum, supposing it to have ascended. Hence it is our duty in a particular manner to study both these subjects, as these are the two first parties who will show the example to the world of a friendly and social union.

Our readers must not therefore be surprised if we shall come forward with an analysis of Southcottianism, a subject which they have been accustomed to regard as the veriest trash in the whole world of intellect; but we are moral and intellectual chemists; and as the chemist never enquires what are the feelings of the public mind towards the material upon which he means to exercise his art, but merely what are the ingredients which he can by decomposition extract from it; so it is with us: we care not for the tastes, the smells, nor the prejudices of the foolish, the misled, and the miseducated public. We care only for the ingredients of living and everlasting truth, which are to be found in all sects, even as certain gaseous substances are to be found in every species of matter.

There is a male and a female character in religion, as well as individual persons. As the Jewish church ended with a bridegroom, the Christian church closes with a bride. As man is born of a woman, so is the new world born of a woman also. Atheism is the infidel church of the woman, because the atheists worship *Nature*, the female, or negative universe. Deism is the male infidelity, because it recognizes *God*, who is a male over all the world. Southcottianism is the church of the woman in faith. It has introduced a new idea into Christianity; and all its disciples designate themselves as the followers of the woman, and their society as the church of the woman. This corresponds with the order of creation. Woman was the last created being, and she is first redeemed; hence the messiah, or the new world, is in a peculiar sense "born of a woman;" and the regeneration

of the world is usually compared in Scripture to the pangs of a woman in travail.

Again, faith represents the imagination, infidelity the reasoning faculty; they are two opposite poles to each other. Hence it follows that the two opposites poles of faith and infidelity, which are at the very end of the line of progress, must first meet each other. This, then, is a prophecy which we make from pure reason, upon principles similar to those upon which an eclipse of the moon is calculated; let our readers watch and see if it be not verified, namely, that "the Southcottians and the infidels will be the first to shake hands, and show an example of concord to the world." A most unlikely thing indeed!

But it may be replied that there *may* be sects similar to the Southcottians in other parts of the world. We reply, that they must be at the end of the line of progress of the *old world*. A Catholic country won't do, for Protestantism is a later movement. An eastern country won't do, for progress has been moving westward. America won't do, for it is vulgarly called the *new world*. They must therefore be in a *Protestant* country, in a *western* country, and in the *old world*. The only rival to Britain, therefore, is Ireland; and it happens very singularly that Ireland was not included in the old Roman empire; and moreover, there is no *woman's church* of faith in Ireland. Hence we pitch upon England, of necessity, as the end of the line of progress, and the two opposite extremes in England are Southcottianism and Materialism.

ST. PATRICK'S PURGATORY.

Nothing, says Mr. Inglis, can be more desolate than the landscape around Loch Dergh. Barren heathy hills surround it on all sides, possessing neither form nor elevation, to give the slightest interest to the scene. The lake is considered to be about nine miles in circumference. As I descended towards the shore of the lake, I could see that the island, which is not quite a mile from the shore, was entirely covered with persons; and on the bank, which I soon reached, I found upwards of two hundred pilgrims waiting to be ferried over. They were generally respectably dressed. Some were sitting, some lying on the grass; some, more impatient, were standing close to the water, waiting the arrival of the ferry boat; and some, more impatient still, had been warmed into devotion by the distant view of the holy place, and were already on their knees. They were of all ages.

As one reason for telling me some of the secrets of Loch Dergh, they said, that I, being a Protestant, should not be able to see anything on the island. I thought, at first, they meant that the holy doings there would be miraculously concealed from the profane eyes of a heretic; but I found that the hinderances were to be merely human. I was told, that the moment it was known to the prior that a stranger was about to visit the island, orders were issued to suspend all devotions; and this I afterwards found to be true. The pilgrims may remain at the station three days, six days, or nine days; and some have even been so far indulged, as to have permission granted them to fast, pray, and do penance for fifteen days. But this is an especial favour. Nothing is eaten or drunk during the whole of the time any one remains on the island, excepting bread and water, or meal and water. Bread and meal can both be purchased on the island; but most of the pilgrims carry their scrip along with them. The penances consist of prayer, fasting, and want of sleep.

The penance of praying around the saints' beds is also practised. These are little circular stone walls, with stones and crosses inside, which are called saints' beds;

and around these, on their knees, the pilgrims perform their "stations," repeating, at certain spots, a certain number of prayers.

The sum exacted from the pilgrim, for all the comforts of St. Patrick's purgatory, including wine, amounts to 1s. 4d., of which 6d. is paid for the ferry. If, however, the penitent choose, there is nothing to prevent him from being generous; and it is not improbable that his generosity may be acceptable. Every pilgrim, who is a candidate for the benefits of Loch Dergh, must bring with him a recommendation from the parish priest. I enquired particularly whether the priest encouraged the pilgrimage, or dissuaded from it. The answer was, that he sometimes enjoins it, but most commonly does not influence the applicant one way or another.

Whatever the weather may be, no one ever takes cold at the station, either from wet clothes or sitting upon the damp ground.—*Inglish's Travels in Ireland in 1834.*

THE THREE GOOD KINGS OF CHINA.

YAOU was frugal in his food, and almost mean in his dress; to study the happiness of his people was his sole business. Unwearied in his researches, he made annual tours throughout the empire; his arrival was anxiously looked for; his presence, as refreshing as that of the rain upon the parched soil. What he taught in words he inculcated by example. "Strive," he said, "for wisdom, and render virtue conspicuous; show obedience to your superiors, be kind, be condescending; thus you will promote harmony, and all the nation will be happy." Without effort he promoted virtue, his sole example being sufficient to render the whole nation virtuous; "virtue ran with the speed of a postilion; and he thus ruled the nation as easily as he could turn a finger in the palm of his hand." A rare instance, and, if true, the only one in all history!

The modest Shun, when he was called to participate in the throne, long refused so high an honour, upon the plea of being unworthy to reign, but Yaou conferred upon him the dignity, without the least hesitation; yet Shun could not allow himself to be called emperor as long as Yaou lived. On his tour through the empire, he paid respect to all the gods by continual sacrifices. These tours, though called hunts, were made with the sole object of examining into the state of the country, and redressing all kinds of grievances. He reduced the criminal laws to a code, which forms at this day the basis of the Chinese laws. Sze-ma-tseen gives some examples of his punishments. To reform the northern barbarians, he sent Kwan-tow, an officer in disgrace, to the Tsung mountain. Kwan, who, without success, engaged in draining the marshes, was exiled to the Yu mountains. In order to render the southern savages more tractable, the Sam-maou nation was sent thither, to establish colonies amongst them, whilst Kaou went amongst the eastern barbarians to teach them better manners. Thus, he inflicted punishment in such a manner, as at the same time to render others happy. As punishments had hitherto been extremely barbarous, consisting in branding the face, cutting off both nose and ears, &c., he abolished these inhuman modes of punishing, enacted effectual laws to prevent crime, and thus proved a great benefactor to his country.

When Yaou died, deeply regretted by all the people, Shun withdrew from office for three years, in order to bewail the loss of this great emperor, and to yield the throne to Yaou's son. But the people deserted the son of Yaou to follow Shun, with joy proclaiming him emperor, so that he at length reluctantly yielded to their wishes.

To record all the eulogiums bestowed upon Shun would be tedious; his reign was most peaceful, his sub-

jects were virtuous. He raised to great honours the descendants of the foregoing dynasty, who had long lived in obscurity. In order to see his actions in a true light, he permitted every body to accuse him whenever they chose. His officers were kept in good order by a tribunal invested with the power of punishing and rewarding. He was not only wise, but also brave. Neither demons nor apparitions could terrify him; nor showers of rain, nor peals of thunder, make him tremble.

When Shun was about to associate Yu with himself upon the throne, he addressed him as follows:—

"Come here, Yu; thou hast proved faithful, and merited well in draining the land. Thou art the only sage. Thou hast shown thyself diligent in regulating the country; in regulating thy own family thou hast been careful. Be not puffed up by vain conceit; but the empire is not envious of thy power, for thou art not vain. Thou seest that I encourage merits and praise deserts, and therefore thou art to succeed me upon the throne, for to thee belongs this august rank."

Thus encouraged, Yu could address his officers in equally strong language.—"Be circumspect," he said—"this will save you much anxiety. Never transgress the law, never study your ease, never be drowned in pleasure. Trust yourselves entirely to the guidance of sages. Never act in opposition to the will of the people, in order to honour your own whims. Be neither slothful nor negligent, and even the barbarians of the four quarters of the globe will acknowledge you as their rulers." The officers frequently replied, and many a wise maxim was uttered during those meetings: we know not, however, how far they practised what they so readily approved. Many of the maxims are worthy of the consideration of all princes; they are the fruits of good, sound sense, and speak highly for the wisdom of those who uttered them. But Yu did not only profit by the advice of his ministers; the simple remark of a common rustic drew his attention. To prevent oppression in every shape, and to gain the necessary advice in government affairs, he caused a bell to be placed at the gate of the palace; whosoever wished to converse with him upon civil affairs, sounded it, and was immediately admitted. A tablet of iron invited the people to complain of any grievances which might have been occasioned by the oppressive measures of their magistrates. There were likewise leaden and stone tablets, to induce the wise throughout the empire to come and advise him on subjects of law, ministerial affairs, &c. He was deeply grieved, when he met, in one of his tours, the body of a man who had been assassinated; but instead of threatening vengeance, he blamed himself for not having prevented such a cruel act by a paternal and efficient government.—*Gutzlaff.*

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

CORRESPONDENTS.

In the article on Air and Water in our last, we employed some equivocal language, which seemed to imply that the decompositions to which we alluded were recent discoveries. We had some other things in view, which are not there expressed.

No. 22.]

SATURDAY, JANUARY 24, 1835.

[Price 1d.]

SYSTEM OF NATURE.

WE must give another chapter upon Sacrifice, as there are some other important ideas which it is necessary to introduce, in order fully to illustrate the subject.

We showed the progress of nature, from the lowest species of typical sacrifice, up to the substance, or true sacrifice, namely, the sacrifice of error and moral evil in the mind, and in the administration of public affairs. When this sacrifice is accomplished, the redemption of man is complete. The types are merely the dumb but expressive language of nature, who teaches her children by sensible signs, thus exercising their minds whilst administering intellectual food. The Israelites were delivered from the Egyptian slaughter and bondage by the sacrifice of the Pascal Lamb; the Christians were delivered from Mosaic bondage by the sacrifice of Christ, who is also called the "Lamb slain;" and we must now be delivered from political and ecclesiastical bondage by the sacrifice of error and corruption in the fundamental principles of church and state economy, which is the great Pascal Lamb, whose flesh is meat indeed, and whose blood is drink indeed.

What, then, are the two natures, human and divine, of politics and ecclesiastics?

The two natures of politics are unequal and equal distribution of the rights and privileges of society. The first is the old world, or the Devil, who is the God of this world; the second is the new heaven and new earth, wherein dwelleth righteousness; *i. e.* the Saviour, who destroys the works of the Devil. There must therefore be a great political sacrifice performed; a Pascal Lamb must be slain for the redemption of man. A literal lamb ewe or ram won't do; a man's blood won't suffice; these are merely individual objects, and any effect which they might produce is finite and temporary like themselves. It is a universal sacrifice; an everlasting sacrifice; a sacrifice of that great beast which is spoken of in the Jewish Talmud, which is so great that the poor shall feed upon it for ever, and its flesh shall never corrupt. Don't you know what this great beast is? It is the political system of the old world, which contains food enough, clothing enough, flesh enough, blood enough, for all mankind; but the poor can never be fed upon it until it be destroyed. Then—when all men shall enjoy the same privileges, when avarice shall no longer collect its hoards, nor lordly pride appropriate whole provinces to itself, nor judgment be purchased by wealth and favour, nor character estimated by the quality of clothing, or the amount of pecuniary resources and family connexions

—then the great Pascal Lamb shall be slain, its flesh and its blood shall be eaten and drunk, and the Son of Man shall give life to the world. It is the wealth of society which constitutes its political blood; wealth is the life of the universal man, even as blood is the life of the individual man. And now that we have passed the horrid darkness of individualism, and look with contempt upon all its sham sacrifices and burnt-offerings, and sin-offerings, its scaffolds, its guillotines, its galleys and its hulks, its prisons, and all its infinite variety of instruments for cleansing the world of its moral evil—we have discovered at last, that after all there is a sacrifice which can bring deliverance to man—there is a species of sin-offering which will bring in everlasting righteousness, and that is a pouring out of the wealth of society into the veins of poverty, for its flesh is meat indeed, and its blood is drink indeed. This is the way to keep the sacrament of the Lord's Supper; better than giving the poor creatures a bite of wheaten bread and half a mouthful of port wine, then exhorting them to return thanks to the Lord for his goodness, and dismissing them with a blessing of words to their damp cold dungeons, where there is neither bread to eat, nor wine nor beer to drink; nothing indeed but that spiritual food, which, rather than Archdeacon Ryder would live upon, he would maraud and murder, with armed men at his heels, and swear the widow to the payment of her tribute over the dead body of her bleeding son. This man and all his brethren dispense the holy sacrament of the broken body and shed blood of Christ; but they do it in type, as a girl dresses a doll, which is an image of a child, which she will dress when she becomes a mother. There is no life, no virtue in the doll; neither is there any life, any virtue in the sacrament of the priests, which they call the Lord's Supper; but it is a formal type of a better system, in which all shall sit down together at the same table, equality and brotherhood prevail in society, and no one shall starve of want whilst others have bread to the full. "Their bread shall be given them, their water shall be sure." "Then shall justice flow down our streets like waters, and righteousness like a mighty stream." Nature always sends the doll, or type, before she sends the living child. Hence, if a man understands types, he can prophesy.

It has always been a puzzling question to the world of faith, what urgent reason there was that the Son of God should die for sin, and how his death has benefited the world. There is nothing in theology more confounding to a believer than this sublime doctrine: the reason is obvious—he mistakes the doll for the child, the type for the antitype, the Christ individual for the Christ univer-

sal. The difference is infinite: he does not know that Christ is Nature or God; and that, "in the dispensation of the fullness of time, *all things* are to be gathered together in Christ, whether things in heaven or things on earth, even in him." (Eph. i. 10). Christ is a universal system; his human nature is the old system, "like unto sinful flesh;" his divine nature is the new, a glorified system. The old system is still alive. If, then, God give not up his Son to death, how can we be saved? If the blood of society—that is, its wealth—be not poured out, how can the poor be nourished? "God gives not up his Son to death, to condemn the world, but that the world through him might be saved." The doctrine is a simple and a splendid doctrine, a genuine fundamental doctrine, of sound political economy and everlasting justice; and, until this sacrifice is made, there can be no salvation. "He that believeth it not must be damned:" he is "damned already," as Christ himself says. (John iii. 18.)

But it is not enough to shed the material blood of the universal man; this is only one side of the question; mere materialism. Many imagine that if there was a proper distribution of food, clothing, and household comforts, society would be perfected. We say no: man is not a mere brute; he is a brute as long as the wants of the brutal nature are ill supplied, or supplied with difficulty, for then his belly and his animal passions obtain the ascendancy; but no sooner are these tranquillized by a satisfactory allowance, than man becomes a metaphysician. If, then, the same unanimity prevail not in this second department of society as in the material, we have gained nothing. Communities and social systems, instituted upon the principle of an equal distribution of fodder alone, may do very well for cattle, but not for men; nor will any degree of prosperity suffice to harmonize the different sectarian views of mankind. Men have shed their blood, and sacrificed their happiness, for opinion in all ages, and they will do so for ever: nor can all the illumination of science, poured in without measure upon the human mind, make the slightest difference in the relative strength of the two parties: they are merely the two polar extremes of mind; they cannot overcome, but they may unite; and they cannot unite without a doctrine which confirms and illustrates the fundamental principles of ALL SECTARIANS, and demonstrates them all to be the scattered members of one great universal spirit of truth; living parts of an organized system of discipline, which all concentrate in a single focus, and accomplish reformation without victory or destruction. Thus no party shall boast over another, for all shall be found contributing their share to the general treasury. This is charity; and, without this charity, save the world who can. "He that sitteth in the heavens shall laugh, the Lord shall have them in derision."

Then, pray, what is this great spiritual sacrifice that is to be made for the salvation of the world? Why, the very same thing must be done with the spiritual department that we have already shown must be done with the material department. We must do away with monopoly and exclusiveness; we must all sit down at the same table; all eat of the same bread, and drink of the same

cup. The infidel must drink of the pure blood of faith and universal theology, and the believer must eat of the bread and flesh of materialism, "for the flesh is meat indeed, and the blood is drink indeed."

The two worlds—the world of politics and the world of ecclesiastics—are exactly analogous; they are composed of exclusive, selfish, and ungracious monopolies; states are divided against states, classes against classes, companies against companies, families against families, individuals against individuals: in the other department, church establishments against church establishments, sects against sects, creeds against creeds, and articles against articles. Both parties are exclusive: the political parties consult their own private interests; they rejoice in triumphing over their rivals; they have no sympathy with those who do not belong to their own miserable, ungenerous clique; and the spiritual parties follow the same universal spirit of the old man; each party appropriates truth, and monopolizes salvation solely to itself. Infidels and believers are all alike, for there is as much bigotry and ignorance in the system of rejection as in the system of exclusive faith; the sacrifice, therefore, which is to be made is the destruction of this great spiritual LAMB (for they all pretend to be very meek and gentle), that an equal distribution of its doctrines may be made for the reunion and gathering of the broken body of truth, and thus all political and spiritual monopolies shall become one.

But which of these is to be accomplished first? and how is it to be accomplished? We answer, that unless the foundation be laid in the mind, the building won't stand. The mind, therefore, must be liberalized. But what is the meaning of being liberalized? If our readers imagine that it means becoming "infidel," they are most grievously mistaken. There are many of the greatest vagabonds in London, who swear, and damn, and abuse all parties and all individuals but their own dear selves, denounce all priests as designing hypocrites, swear that the Bible was invented by the monks! and always profess to belong to the liberal school!! A pretty school, indeed! a school of deplorable ignorance and bigotry; a perfect negation, not only of faith, of science, and useful knowledge, but of common courtesy! These are merely exceptions, however; they do not represent the intelligent and organised portion of the infidels, who are equal in point of general information and good morals to any other class in society. But infidels are not liberals! The name may apply to them comparatively, inasmuch as they are less exclusive than other parties, because they have no articles of faith, no set of religious propositions around which they rally, but present open arms to all who reject the doctrines of the priests. They are purely negative in their religious character. They neither analyse, nor think it worth their pains to analyse, any religious system or the progress of nature; they sweep them all away with one large besom of destruction. But this is not liberality—this is condemnation and destruction. To destroy evil is good; but to destroy indiscriminately evil and good, is bad; and it must be indiscriminate destruction if it is not preceded by a candid analysis, which compares the principles

of religion with the science of Nature. Indeed, to destroy any system without having a substitute for the one destroyed, produces no moral change which can be called an improvement, for it has always the effect of scattering its members, and thereby diminishing their united strength. When the system thus divided is a bad system, this division is good as a transition step to a better; but the division itself is not a system, for it is a pure negative, and incapable of united exertion. This is the position of modern infidelity. It has no positive doctrine respecting theology.

In respect to church doctrine of every description, in respect to public and private morals, the infidel is infinitely superior to the believer, in so far as he can easily demonstrate the absurdity and injustice of priestly instruction. In respect to the historical, prophetic, and scientific evidences of religion, the Christian is infinitely superior to the infidel, and these two facts point out distinctly the strength and weakness of both parties. The Christians err in the meaning which they attach to religious mysticism—the infidels err in denying that it has any meaning; and the two parties can only unite upon the following principle—*The Christians must liberalise the word, by giving it a universal meaning, such as we point out in the System of Nature; and the infidels must acknowledge the divinity of the word, which is thus so simply, and without any torturing or twisting whatsoever, made to teach a more perfect universalism and liberality than their own, whilst in every minute circumstance it agrees with general science.* This is the ultimatum of the progress of Nature. Victory is out of the question. The two parties are the two anointed ones, the two churches, the two messiahs, the two witnesses, the two polar extremes, the male and female principles God and Nature. Union and love is their destiny. God will not destroy Nature, nor Nature destroy God. If either party gained, it would be a loss to liberality and charity. If old faith overcame, then illiberality and exclusive bigotry must triumph; if old infidelity overcame, then the consequence is the same, as it can give no satisfaction to the enquiring mind respecting the origin and meaning of religion; but merely answers the intelligent querist by saying, Moses was an impostor; Jesus Christ was an impostor, or an enthusiast, who pretended to more than he knew; or his apostles were impostors, and the ancient fathers and early Christians were impostors, &c.; in fine, in this word impostor is comprised all the satisfaction which an infidel of the negative school can give; and, to say the best of it, there is not much charity or liberality in thus so profusely lavishing our condemnation of the leading characters of all past ages.

But a man may be an infidel to all churches without being an infidel to God and Nature, or any system of religion. We profess infidelity to the church doctrines, as taught by the priests; yet we hold all these doctrines, and believe them most devoutly, as expounded by the science of Nature. The superior divinity of the Bible we think is as demonstrable as the multiplication table. It is only ignorance that cannot perceive it. So far as we have gone, our illustration of it is before the public; and so far as we shall go, all the future will be as scien-

tific as the past. Refutation we court. We rejoice in opposition, if not obstinate and ignorant opposition.

We have one more question to answer: How shall this sacrifice be effected? It is a gradual, growing work. It must grow like a seed. Hence we are not inclined to think that it can be national, until the system is first exemplified on a limited scale by the practical development of UNIVERSALISM, in the organization and union of all those who are imbued with its principles. But no man can be said to be a universalist who cannot coincide, as well as disagree, with the fundamental and characteristic principles of all sects and parties under the heavens; but for this country only a few doctrines require to be particularly known, such as Popery, Protestantism, Southcottianism, Materialism, all which we shall notice in due order, and show our readers the great secret which has been concealed from the human mind from the beginning, viz. that all religions are both true and false at one and the same time. "He that believeth not, shall be damned."

The great sacrifice for sin, then, to which we have alluded, is the sacrifice of exclusive selfishness in the distribution of wealth, and in matters of theological opinion, substituting a more liberal distribution for the one, and a more liberal system of philosophical analysis for the other.

THE SHEPHERD.

THE DOCTRINE OF NONENTITIES.

TO THE EDITOR OF THE SHEPHERD.

Sir,—A correspondent of yours, in your last week's *Shepherd*, who signs himself W. N., says he is desirous of obtaining information upon the above-named doctrine. He considers, like some of the ancients, and the late Bishop Berkeley, that it is possible that every thing which we usually believe to have an existence may exist in our imagination only; and that nothing has any existence in reality, except our imagination. The way this doctrine of nonentities is supported by its promulgators is this:—Put a living man's hand, they say, into the fire, and he will imagine the fire to be hot; but put a dead man's hand into the fire, and he will not imagine it to be hot. "What then constitutes the difference," they say, "between the two?" Why, the imagination only. The imagination, therefore, they say, is every thing, and nothing exists but the imagination. I will illustrate this doctrine still further: thus,—

Lay a live worm in the palm of your hand for one hour, when you imagine your hand to be perfectly cool; and at the end of the hour you will find the worm dead, and dried to a crisp. Now this worm, during this time, would imagine your hand to be unbearably hot; you, on the contrary, would justly deny that you were hot, and would imagine, on your part, the worm to be cold: this the worm would deny. In short, you would mutually accuse each other in your own imaginations; the worm would accuse or imagine you to be hot, and you would imagine that to be cold. The imagination, therefore, is said to be the reality, or the real thing that exists, and the heat and cold merely ideal or nonexistent. This doctrine is false, and I proceed to prove it so; but first I will prove how the imagination is produced.

You are a hot-blooded, and the worm is a cold-blooded animal. Neither of you can feel your own inherent properties in yourselves, any more than fire can feel itself hot, or ice feel itself cold; but each of you can feel the opposite property in the other. If cold were not to come in contact with you, you could have no imagination about cold; and if heat were not to come in contact with the worm, that could have no imagination about heat. It is these two opposite properties then, coming in contact with each other, in two beings of different temperatures and organizations, that produce the two imaginations. I now proceed to prove the doctrine of nonentities to be false.

For an imagination to exist there must be two different properties or qualities coming in contact with each other to produce that imagination. For these two properties or qualities to exist, there must be matter for them to exist in; and for matter to exist, there must be space for it to exist in, and so on. Matter might exist without two different properties to produce an imagination; but neither two different properties, nor one property, can exist without matter for it to exist in. Man may exist for a time, as he does when he is dead, without an imagination; but the imagination cannot exist without the material man. Matter cannot become nonexistent, but the imagination can and does become so. Matter therefore is the *reality*, and the imagination a nonentity, an unsubstantial idea, or an imagination only.

An old Grecian philosopher was one day endeavouring to support this doctrine of nonentities, in opposition to an antagonist. His antagonist hit him a box on the ear. The old man became angry. "Pooh, pooh," said his antagonist, "what are you angry about? It is probable that I did not hit you at all. It is possible that the fact only exists in your imagination." "By Jove," said the old man, "although I teach a different doctrine in the academies, when I come out into the open world I am obliged to think, talk, and act like other people."

Believing that I have said sufficient to expose the absurdity of this doctrine, I remain, Sir, yours respectfully,
Jan. 14th, 1835. W. S. P.

[If we understand our correspondent aright, he has taken for granted the very thing which was to be proved. "Properties or qualities," he says, "cannot exist without matter for them to exist in." This is the thing to be proved. It is quite as easy to imagine *power* existing out of matter as in it. Nay, it is quite impossible to imagine *power* resident in matter. It can only exist between the particles, not in the particles; just as electricity exists on the outside of a body, but not in the inside. We cannot understand what our correspondent means by the properties of matter; nor how he proves that it has any properties at all. We know that there is a certain power resident in certain forms and aspects of Nature, such as the magnetic power in iron; but we also know that that power is transferrable from one body to another. A needle becomes a magnet by contact, without receiving any new material that we can demonstrate. It receives a property, but it is a moveable property, which comes and goes like the money in a man's pocket, yet is not cognizable by the senses.]

Now our correspondent seems to imagine that this property is matter itself; or what does he mean when he says "matter is the reality, and imagination the nonentity?" If by a nonentity he means something not to be perceived by the external senses, we agree with him entirely; but if he means that matter has the power, and imagination none, then we dissent entirely from his doctrine, for the very reverse is the truth. The matter is merely an instrument by which the power acts. It is one of the two poles of Nature; the active power is mind. Matter is purely passive, and has no other power but that of dead resistance.

Heat and cold are not matter; they are merely action upon matter; action occasioned by the two polar properties of Nature. Our correspondent acknowledges this, and says that these two properties produce the imagination, by acting upon the temperature of the body; but the temperature itself is not matter, it is merely a condition. The body is matter—but what sort? Oxygen, hydrogen, nitrogen, carbon; three gases and a powder: the powder itself can be converted into a gas. The body then is a collection of infinitely small particles, or atoms if you will, with two polar properties, like magnets, so as to attract and repel; but these properties reside on the outside, not within. Hence the property is one thing, and the matter another; the matter merely being an instrument in the hand of the property. In other words, matter is the tool, the subordinate principle of Nature; and so far from having any property, it is merely a property of power or mind. Therefore we come to the conclusion that matter is a property of mind; or, in other words, has a secondary existence.

The joke of the old Grecian philosopher is very good as a joke, but won't pass for an argument; for the question of the primary existence of matter does not affect the laws of mental sensation, or any of the movements of animal or intellectual life. It is merely an exercise for the reasoning faculties; a sort of intellectual amusement. But it is of considerable importance that men see the superiority of mind over matter; and it surprises us much to see men otherwise intelligent defending the fundamental error of the superiority of matter, by talking of the properties of matter as they do. Matter has no properties but dead resistance. It is the very emblem and hieroglyph of death.—Ed.]

VARIETIES OF THE HUMAN SPECIES.

THE power of producing like individuals, is considered by naturalists as the most certain test for fixing the species in red and warm-blooded animals. This power of self-perpetuation, by a constant succession of similar beings, is found in all the races composing the human species, however different in colour, structure, and manner of life. Men, then, are but one species, and the difference that appears in them, according to the region of the globe they inhabit, can only constitute varieties of races. I admit, with M. Lacépède, the worthy continuator of Buffon, four principal races of the human species, which I shall call, like him, the European Arab, the Mogul, the Negro, and the Hyperborean.

We might add a fifth, of the American, were it not most probable that the new Continent is peopled by inhabitants, who, coming from the old, either by land in the austral hemisphere, or along the immense Archipelago of the Pacific Ocean, have been altered by the influence of that climate, and the yet virgin soil, so that they are to be regarded less as a distinct race than a simple variety.

There is, in truth, this difference between varieties and races, that, in these last, there are implied modifications more profound, more essential differences, changes not confined to the surface, but extending to the very structure of the body; whereas, to make a variety, nothing more is needed than the superficial influence of climate on the integuments which it colours, and on the hairs which it makes longer or shorter, lank or curled, hard or soft. An Abyssinian, scorched by the heat of an almost tropical sky, is as black as the negro under the equator; yet they are by no means of one race, since the Abyssinian, a negro only in colour, resembles the European in the cast of his face, and the proportions of all his parts.

The characteristics of the European Arab race, which takes in the inhabitants, not of Europe only, but of Egypt also, Arabia, Syria, Barbary, and Ethiopia, are an oval, or almost oval face, in the vertical direction, a long nose, a prominent skull, long and commonly lank hair, a skin more or less white. These fundamental characteristics are no where more decided than in the north of Europe. The inhabitants of Sweden, Finland, and Poland, give the prototype of the race; their stature is tall, their skin of perfect whiteness, their hair long, lank, and of a light colour; the colour of the iris generally bluish. The Russians, the English, the Danes, the Germans, are already somewhat removed from this primordial type: the colour of their skin is of less pure white, their hair of a deeper hue. The French seem to stand midway betwixt the nations of the North and those of the South of Europe. Their skin is shaded with a deeper dye, their hair less straight, and more of a chestnut and brown colour. The Spaniards, the Italians, the Greeks, the European Turks, and the Portuguese, are browner, their hair in general black. Lastly, the Arabs, the Moors, and the Abyssinians, have hair, in some measure, black and crisp, the skin tawny, and might serve for the step from the European Arab to the Negro race; which is, however, distinguished from them, by the flattening of the forehead, the smallness of the skull, the slope of the line measuring the height of the face, the thickness of the lips, the projection of the molar bones, and further, by a darker skin, thicker, greasy, and, as it were, oily, as well as by shorter, finer, curly, and woolly hair.

The Mogul race has the forehead flat, the skull jutting but little, the eyes looking rather obliquely outwards; the cheeks are prominent, and the oval of the face, instead of extending from the forehead to the chin, is drawn between the two molar bones. The Chinese, the Tartars, the inhabitants of the Peninsula, of the Ganges, and of the other countries of India, of Tonquin, Cochin-China, Japan, of the kingdom of Siam, &c., compose this race, more numerous than all the others, and apparently more ancient also; which is spread over a far greater extent

than the European Arab race, and yet more than the Negro race, since it reaches from the fortieth to the sixtieth parallel of latitude, occupying an arc of the meridian of nearly 75°, whilst that which measures the countries of the European race is only of 50°, and the Negro race lying under the equator, between the tropics of Cancer and of Capricorn, is bounded within the limits of an arc of from 30° to 35°.

The Hyperborean race, situated in the North of the two continents, in the neighbourhood of the polar circles, composed of the Laplanders, the Ostiaks, the Samoiedes, and the Greenlanders, is characterised by a flat face, a squat body, and a very short stature. This degraded portion of the human species derives, evidently, from the climate, its distinctive characteristics. Striving for ever with the inclemency of a severe climate, the destructive action of an icy temperature, Nature, fettered in her motions, shrunk in her dimensions, can produce only beings whose physical imperfections explain their almost barbarous condition.

The small progress of the Negroes in the study of the sciences, and in civilization, their decided taste and singular aptitude for all the arts which require more taste and dexterity, than understanding and reflection, as dancing, music, fencing, &c., the figure of the head, which is midway between that of the European and the ourang-outang, the existence of the intermaxillary bones, at an age when, with us, the traces of their separation are completely effaced; the high situation and small development of the calf of the leg, have been arguments more specious than solid to those who have endeavoured to abase this portion of the human species, in order to justify an iniquitous traffic, and a cruel tyranny; reproaches of civilized men, which they must wipe off by other means than a presumptuous assertion of their own dignity, or a proud insult on the native character of those whom they themselves have cast into degradation.

Without admitting this belief, which owes its origin to a thirst of riches, we cannot help acknowledging that the differences of organization draw after them a striking inequality in the development of the moral and intellectual faculties. This truth would appear in its full light if, after summarily indicating, as I have just done, the physical characteristics of the races of men, I could unfold their moral differences as real, and not less marked: opposing the activity, the versatility, the restlessness of the European, to the indolence, the phlegm, the patience of the Asiatic, examining what is the power, on the character of nations, of fertility of soil, serenity of sky, mildness of climate; showing by what catenation of physical and moral causes, the empire of custom is so powerful over the people of the East, that we find in India and China the same laws, manners, and religion, which prevailed there long before our era: enquiring by what singularity, well worthy the meditation of philosophers and politicians, these laws, this worship, and these manners have undergone no change, amidst the revolutions which have so often taken place among those nations many times conquered by the warlike Tartars; showing how, by the irresistible ascendancy of wisdom and knowledge, ignorant and ferocious conquerors have adopted

the usages of the nations they had subjugated; and proving that the stationary condition of the sciences and arts among those who, so long before ourselves, were in possession of the advantages of civilized society, is derived not so much from the imperfection of their organization, as from the degrading yoke of a religion loaded with absurd practices, and which makes knowledge the exclusive birthright of a privileged caste. But such an undertaking, besides exceeding the limits I have prescribed myself, does not belong directly to my subject.

The *Albinos* of Africa, the *Cagots* of the Pyrenees, and the *Cretins* of the Valais, cannot be given as varieties of the human species. They are infirm, feeble, degraded beings, incapable of reproducing an existence, which has fallen to them, in the midst of a healthy, vigorous, and robust population.

We are not to believe what some travellers have written on the existence of tribes of giants, that have appeared on the Magellanic coasts. The Patagonians, concerning whose stature there is so little agreement in relations, are men very well formed, and whose stature does not exceed ours more than nine or ten inches. The Laplanders, whose stature is the smallest, are as much below as the Patagonians are above; it does not exceed from four foot to four and a half. In the midst of ourselves, individuals reach from time to time a stature sufficient to entitle them to the name of giants; whilst others, shrunk in all their proportions, are a renewal of the pigmies. Such was B   , the dwarf of Stanislaus, the king of Poland; Goliath, spoken of in the Book of Kings, xvii. 4; the King Og, Deuteron. iii. 2, and many others, whose stature varies from six to ten feet high.—*Richard's Physiology*.

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER V.

A TRAVELLER was returning from a long journey; his home stood like a heavenly garden before the eyes of his imagination. With every step he made his heart was beating louder and louder; for he had left for many years his native land, and his thatched cottage, with the overhanging fruit-trees, the Eden of his childhood; wherefore he doubled his steps the nearer he came to his dear home. But when he had reached the summit of the mountain, on the opposite slope of which his cottage was situated, a dark night spread a black veil over his path.

"What shall I do in this darkness!" sighed the good man. "Who will lead me safe over the mountain? Shall I lose myself in the woods, and become a prey of the hungry wolf that infests the forest?"

Whilst he stood still uttering these complaints, and looking whether he could discover any human trace, he beheld at a distance a light, a bright moving light; a God-send to the weary, forlorn wanderer; and refreshed with hope, he hastened towards the friendly element.

Whilst proceeding in the direction of the moving light a thundering voice called from a distance, "Stop, wanderer, stop! If thou proceedest farther on thou art the son of Death." He stopped and hearkened, and he heard as it were the splashing of oars, and after awhile he could

distinguish a boat approaching. And the boatman called to the wanderer, and said, "Man, what seduced thee from the right path, and brought thee to the brink of death?" "It was that friendly light that shines before me," replied the wanderer.

"A friendly light!" exclaimed the fisherman, who in the meanwhile had landed; "it is a deceiving flame, the offspring of corrupted marshes!" In fact it was an ignis fatuus; or rather two or three, or more, which from time to time flame and disappear.

They had all disappeared, and the traveller returned hearty thanks to his preserver. Yet the fisherman answered and said, "Why should one man allow another to die in error, instead of showing him the right way? We must both offer our thanks to God; I, for having been chosen as his instrument to preserve thee from perdition; thou, because saved from the brink of a precipice, where a false light was alluring thy erring steps."

The fisherman, who by long habit knew to find his way in the darkness, took the wanderer under his arm, and led him safe down the mountain, and placed him on the high road, which conducted him in a straight line to his native cottage. And here I will leave him, opening the well-known door, and embracing his dearly beloved ones. And I will turn myself to you, my gentle readers, for whom this parable is intended.

The false science, the science of individualism, of sectarianism, of one principle, is like unto that shining, deceiving offspring of corrupted marshes. The bipolar philosophy, the science of nature, applied to all the business of life, is the friendly fisherman that brings you safely to your homes. And do you know what your homes are? Those four walls within which you eat and drink? Surely not. The towns in which you work yourselves to death to feed in luxury a few idlers? Surely not. Your home is the whole of nature, where knowledge is the fruit that refreshes and strengthens us, and makes us like unto gods.

Now this science of nature teaches us also how to subdue diseases and restore health; yea, I hope it will in a future time teach us to subdue death. This science is but in its beginning, though it has been put into practice partially and instinctively in all ages. And because the people who exercised it in former ages, did not know the true reason of their working, they ascribed this power to God or to the devil, according as they applied it with good or bad intentions.

In fact they were not entirely mistaken in ascribing this power to one of the two principles; because the principle of this power of healing is *spiritual*, and diseases are also *spiritual*.

The principle of healing is the spirit of light and of life; the principle of disease is the spirit of darkness and of death. Hence he who can forgive the sins can also heal the diseases. The first physicians were priests. The snake, which was the symbol of the fall of man, is also the symbol of the art of healing; because, in order to cure a disease you must create a disease; and the snake and the cross are both necessary to salvation.

Since there is but one spirit, the Spirit; one life, the Life; and since health and disease are but the positive

and negative of the same spirit, and of the same life, there can be but one principle of healing.

This one principle of healing is the bipolar magnetic, or solar and telluric. All other modes of treatment are but secondary means, which act chemically and mechanically, more to the injury than to the benefit of the human frame. If they act otherwise, they act magnetically; for instance, bark acts magnetically in all cases where the disease has assumed the shape of intermittence; the cow-pox acts magnetically in bringing forth a principle counteracting contagion; all epidemic diseases, the plague, the cholera morbus, the marsh fevers, are produced by solar or telluric influences, and disappear by changes in the keys of the great panharmonicon (*universal harmony*) of nature.

The magnetic origin of diseases explains the phenomenon of their being under the influence of certain numbers. Indeed the mystical importance given by the old philosophers, physicians, and divines, to certain numbers, is owing to the instinctive intuition of the magnetic solar and telluric oscillators. It is a fact that must strike every impartial observer, that in the 3d, 7th, 9th, 11th, 14th, and 28th day, fevers and other diseases, both acute and chronic, are in a state of increase or decrease.

It is a fact that none can deny, that some mental disorders, some nervous complaints, such as epileptic fits, St. Vitus's dance, and other like disorders, break forth with greater violence during the spring tides. So great is the concord and harmony of nature.

Modern physiologists, for instance, Schubert, in his *Universal History of Life*, Golres in Munich, Professor Walter in Bohn, Professor Burdach in Königsberg, have found that the influence of the numbers three and seven in the development, cause changes in the human frame. It is a well-known fact, that a child may live, if born in the seventh month, and will not live if born in the eighth month. Every seven years the whole body of man is changed by an organic transubstantiation. The 7th, 14th, 21st, 35th, 49th, and 56th years, generally produce changes in the human body; and the 63d year is the grand climacteric, being the multiplication of 9 by 7.

The number nine is the most remarkable of all the units. Thus when nine is multiplied by any figure or figures, the digits in the product being added together make up the number nine. Thus, for example, $9 \times 3 = 27$, and $2 + 7 = 9$; again, $9 \times 40 = 360$, and $3 + 6 = 9$.

I shall not follow up the magnetical power of numbers in the polarity of light, in the formation of colours, in the wonderful combination of sounds. I will only mention, that even in that which is called inorganic nature, for instance, the elective affinities in chemistry, the formation of strata in geology, and the crystallizations, the influence of numbers is as evident as is the construction of animals and plants.

Pythagoras was the first who by an act of magnetic ecstasy had the intuition of the mystical science of numbers. The means adopted by him instinctively to produce this ecstasy will be found to correspond with the means discovered by the science to bring forth that highest state of telluric, or night life, called somnambulism. I shall finish this letter, presenting my ideas upon the nature of the human soul, and its bipolar nature.

The soul is the spiritual principle of life. Life being bipolar, the human soul must also present a bipolar activity. Acting as the representative of the solar principle, it appears as reason and intelligence, and as the plastic or forming principle. The soul forms both the reasoning faculties and the *organs of thinking*. In the character of the telluric principle it appears as instinct and sense,

and forms the perceptive faculties, and the *organs of sensation*. As the principle of intelligent life, it forms the brain and the cerebral nerves; as the principle of instinctive life, it forms the ganglia and the sympathetic nerves.

In order to support these two extremes it forms the animal system, blood, lymph. From the different proportions of these different organs of the soul arise the difference of temperaments, capacities, and passions. The philosophers who pretended that men had three souls—the vegetative, intelligent, and animal soul—were correct in the triad; but, for want of a knowledge of the science of polarity, mistook the two extremes and their middle term for three different individualities.

THE ALPINE PHILOSOPHER.

THE DOCTRINE OF THE "WOMAN."

Now for a trial of our readers' liberality and charity. *Ite, procul ite, profani!* (Hence, far hence, ye profane!)

"If any man among you seemeth to be wise in this world, let him become a fool, that he may be wise." "For God hath chosen the foolish things of the world to confound the wise."—*Paul to the Corinthians*.

In obedience to this sacred advice, we shall endeavour to bring our readers to that extremity of folly, which we consider to be the threshold of wisdom. In fact, if we can possibly turn their brains, we shall do it, for men's brains are all wrong side upward. Hence the prophet says, "The world shall be turned upside down." Men shall walk upon their heads—that is, the foundations of society shall rest upon mind, and not upon brute matter. Laying all joking and mystery aside, however, let us proceed.

We promised last week to give an analysis of the Woman's Church in faith, namely, the Southcottian, or Southcottian Church—to clear the hidden gem it contains from all the rubbish and mystery which surrounds it. The rubbish is no detriment to the gem, but often a good preservative; nor are the children of this generation in general so extremely foolish to despise a jewel because there is a cart-load of trash around it. The Christian church is a female church, being taken out of the side of the Jewish church, as Eve out of the side of Adam. Hence the rite of circumcision was abandoned at its institution; the political or ceremonial law, which is man's prerogative, was withheld; the moral law, which is woman's forte, was made superior to the other. The beard, which is man's characteristic, has been generally shaven, either by churchmen or laymen, and latterly by both. The great original church of Christianity has been styled the Mother Church; and the Virgin Mother of God has been exalted to the greatest ecclesiastical honours, even above the Founder himself; and the impression has prevailed amongst all the mystics and inspirati of the church, that a *BRIDE* should appear in the latter days. "The marriage of the Lamb is come, and his wife hath made herself ready." "The kingdom of heaven is like unto a marriage," &c.

Accordingly, we find that, in the latter days of the church, the spirit of the woman begins to be stirred. Many women in different countries have appeared, professing to be this long-expected, long-promised helpmate to man, of which we shall only mention two at present—namely, Mrs. Buchan, in Scotland, and Mrs. Southcote, in England. Mrs. Buchan had many followers whilst she lived, and was a most remarkable character,—having so many arguments to adduce in her own behalf, and so many extraordinary circumstances connected with her history, and substantiated by respectable testimony, that

old Mr. Bell, a respected and popular clergyman of Glasgow, used to say that she was enough to deceive even the very elect. She died, and was buried after the magistrates of Glasgow interfered to enforce her interment; for she had told her followers that she would rise *again*, and these *seemingly* wise men were not foolish enough to know the meaning of it. However, she did rise again—she rose again in Joanna Southcote, at the other end of the island, in 1793, a few years afterwards, and the Buchanites did not know their own mother; so they were scattered like snuff in a whirlwind of mystery. Joanna lived and prophesied with great reputation for twenty-two years; she also died, and was buried, and prophesied that she also would rise again—but the Southcottians were too *wise* to know the meaning of it, though many of them assert to this day, that when her body was opened, the promised Shiloh was seen to ascend into heaven in a column of vapour. These are very wise believers: we are afraid to argue with them. But we prefer our own simple folly to their wisdom; yet we have no hesitation in declaring our firm conviction that Joanna will rise again, and that her son shall appear.

Of all the brides, Joanna is the only one who has succeeded in establishing a church; which church still continues to make converts, but is divided into innumerable little coteries, or private churches, spread over all Britain, even to Aberdeen. Of course she is at present the principal, but not the only, representative of the Bride. Her writings are also in preservation, which are appealed to as divine authority, in every respect equal to the authority of the old Bible.

When she comes again she is to come with the Bridegroom and the Son, and then the Law and the Gospel are to be united.

We shall now make a few brief observations. Nature, being male and female, is bridegroom and bride. The individual man and woman are made after this great model. The church, or universal man and woman, has the same twofold character. But although the true and only bridegroom and bride are the two principles of nature, all the rest are representatives; and as an individual in monarchy represents a state, so, according to the same law of nature, an individual man and woman represent the two churches. Christ represented the *divine* nature at the close of the Jewish church: why should not a woman represent the *human* nature at the close of the Christian church, seeing the church is called the *bride* of God? Answer that, ye Christians of the old school!

Again—it is not the man church who brings forth the son, but the woman church. Hence there must be a third church, the product of a male and female church. Christianity must have a son.

Again—it is not the first birth, or birth of the flesh, which brings deliverance, but the intellectual birth, or birth of the mind. "Except a man be born again, he cannot see the kingdom of God." It is not to flesh and blood, therefore, or to a literal birth, that we have to look, but to a principle of truth, which combines the two natures in one. Hence Joanna very beautifully says that the child is born within us.

But did she not deceive and disappoint her followers? Most assuredly. And did they not deserve to be deceived? What were they looking for? A lump of flesh and bones to come and lead them to glory; some expected to be riding in carriages clothed in purple and scarlet, and ruling over the heretics, with great pomp and most enviable dignity. Ungenerous fools! to think that the regeneration of nature consisted of the enthronement of ignorance and brute matter! They were all deceived, and so was she; but still her doctrine is true.

"True?" says the Christian, "how can it be true when she deceived her followers?" We answer, How can Jesus Christ be true when he deceived his? Did he not tell them he would come in the clouds of heaven to destroy Jerusalem—"there be some standing here who shall not see death till they see the Son of Man coming in his kingdom." Did he not tell his disciples that "they should sit on twelve thrones judging the twelve tribes of Israel?" Did they not believe this to the last; so that when he ascended, the last question they asked of him was this: "Wilt thou at this time restore the kingdom to Israel?" and away he went without giving them an answer. If the bridegroom deceives and speaks mysteries to the people, why should not the bride follow his example? But it is ignorance alone that is deceived. Any schoolboy who knows the Science of Nature, even the rudest elements, may understand the whole plot of the drama.

We shall continue this subject, nor shall we forget the other woman, the church of materialism, who also represents the bride, and has originated the doctrine of the emancipation of her sex.

"NEW CHRISTIANITY."—Those who really desire to study in earnest the subject of the progress of Nature, will find some excellent elementary instruction in a little work called "New Christianity," translated from the French of St. Simon by the Editor of the Shepherd. It may be had of our publisher, Mr. Cousins, for One Shilling. The work itself gives a very simple and intelligible idea of the first efforts in France to analyze the proceedings of Nature in the education of the human race; and the Editor's Preface and Notes serve to throw additional light upon the subject. We ought all to become acquainted with the first dawnings of the new world. St. Simon was a wonderful character, considering the age in which he flourished, but he had merely a glimpse of a better and more perfect philosophy. The publisher gives a coloured engraving of the St. Simonian Free-woman along with the book, which we have requested him to keep loose, as it does not belong to the work itself.

LIBERTY AND NECESSITY.—It is a universal law of Nature, that when two powers act in opposition, that is, when action and reaction take place, friction is produced. Hence the impossibility of perpetual motion, without a self-restoring power. To talk, therefore, of action and reaction in Nature without the *self-restoring power*, is uttering words without meaning. Now, that self-restoring power is liberty, which is mind. Every man feels it in the additional energy which he can give to his body when exhausted or fatigued. It is the opposite or positive pole to necessity, which is the law of friction, and would bring all nature to a dead calm, if this original impulsive power did not renew the action. This power of course is *stimulated* to action by a motive, but it is a moral or intellectual stimulus, the opposite of the other, which is brute necessity. Hence the absurdity of a system of Nature which does not regard mind as universal as matter. The self-restoring power of Nature is what in strictly correct language ought to be called God, the other (necessity) is what is understood by NATURE.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

We should like to see more of A. D.'s theory.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

The Shepherd.

No. 28.]

SATURDAY, JANUARY 31, 1835.

[Price 1d.]

SYSTEM OF NATURE.

In this chapter we propose to consider another department of theology, namely, inspiration itself; a subject upon which Christians and infidels entertain equally absurd and ridiculous notions.

This, of course, divides itself into two doctrines—inspiration and no inspiration, or faith and infidelity; but this is not the division of Scripture; the division of Scripture is partial and universal inspiration, at one time teaching that only some individuals are under the guidance of heaven, at another that all men are merely the instruments of Providence, “who holdeth the hearts of all men in his hand, and turneth them whithersoever he will.” “Man’s goings are of the Lord; how can a [man] then understand his own ways?” “The lot is cast into the lap, but the whole disposing thereof is of the Lord.” “A man’s heart deviseth his ways, but the Lord directeth his steps.” Even infidelity itself is divine inspiration—“they believed not on him, that the saying of *Esaias* the prophet might be fulfilled, which he spake, saying, Who hath believed our report?” &c.; “therefore they could not believe, because that *Esaias* said again, He hath blinded their eyes and hardened their hearts,” &c. This is a very clear and intelligible specimen of the positive and negative action, beautifully illustrating the doctrine of the *Shepherd*, that both sides of the question are of God; but the ignorance of man cannot reconcile them; reconciliation could only take place in a time of radical reformation and universalism.

There is so very little difference between a common believer and a common infidel on the first principles of theology, that they may both be classed in the same school—both infidels. The common believer takes it for granted, that the ordinary thoughts, words, and actions of men are things which God has nothing to do with; this the infidel agrees to. These thoughts, words, and actions are merely the spontaneous movements of the individual himself—*agreed by both*. The only little trifle upon which they differ is what is called the “divine inspiration of some men who died two thousand years ago;” for both parties cordially agree in this, that there is not a whit of inspiration now-a-days. Hence it clearly follows, that if the past were forgotten, the believer and the infidel would both be of one school.

We call them one school, the school of the old world, the school of division, which separates the individual from the universal mind, and makes the world a chaos of confusion. But though all the past were obliterated from

the pages of history and the memory of man, we and they would be perfectly distinct.

There are two distinct powers in every individual: there is the voluntary power, which he calls himself; and there is the involuntary power, which carries on all the secret movements of his body. This latter power resides in every part of the system; but its chief residence is in what is called the sympathetic nervous system, a system over which we have no immediate control, but from which we derive our being and life. It never sleeps, but in death. It is this nervous system which moves the body of the somnambulist when he rises in sleep and performs many singular actions, of which the individual is not aware, and can never have any remembrance. Many have read, written, cast up accounts, and performed many similar movements of intellectual life in sleep, gone to bed and awakened without the slightest consciousness of what they had done; indeed, when they are awakened during the influence of such a fit, they seem quite alarmed, astonished to find themselves in such an awkward predicament. They can see what they are about, but they can see or hear nothing that is foreign to the object they have in view. Light or darkness makes no difference; the female somnambulist can thread her needle and do her work in the dead of night without the aid of a candle; the male can cut his pen, arrange his papers, accounts, &c., in a similar way. How is all this done? It is done by what our Alpine Philosopher would call the opposite polar character to that of waking; which latter being the life which now predominates, is of course the most influential in the body; but the other frequently prevails in certain constitutional habits, and produces the phenomena to which we allude.

This illustration we have brought forward to explain what we mean by the double nature of individuals. Both these natures are God, who is all and in all; but in making a distinction between the two, we say that the somnambulant nature being the most secret and unfamiliar, may be characterized by the name of “God,” in a particular manner; for it is to this nature chiefly that we owe all the visions, prophecies, and mysteries of religion in all ages. But as this nature is not the ruling power of individual life, but merely the occasional usurper of the use of the body, so neither are those dreams, visions, and revelations which it gives forth to be regarded as the ruling principles of social life, which ought all to be subject to the “voluntary principle.” This voluntary principle is reason and liberty, and its speedy accession

to power is typically proclaimed in the propagation of the *voluntary principle* of the Dissenters, which means with them, however, only a voluntary instead of a compulsory support of the church.

These visions, prophecies, revelations, &c., of the somnambule nature, are true; we don't deny that some individuals may have pretended to have them; but we believe we could very easily detect a pretender; and we are certain that no pretender ever succeeded in establishing a faith. They have been common in all ages, and still are—genuine and unadulterated. Such were the famous prophecies of the Sibyls, which were burnt in the Capitol, in the year of Rome 670; but such was the estimation in which they were held, that Augustus, according to Tacitus and Suetonius, sent to Samos, Erythraea, Troy, and all other Italian colonies, to re-collect them. Such also were the oracles of the Pagans, and the Jewish mystery. But there is a principle of monarchy or subordination in every department of nature. Superiority resides somewhere, and both time and space have given superiority to the Jewish mysteries, inasmuch as they have been invested with greater power and authority. They thus become the head of the great mystical body.

This is the Elementary Philosophy of Inspiration. But are we to infer from this that we are to bind ourselves to a slavish obedience to this mystical power, as if this, and this alone, were divine? So says the church; so say all believers, as they call themselves, who deny the presence of God in any other department of nature but that of somnambulism; thus divesting reason, science, and every thing that we usually call sober sense and discretion, of their divine character. The very contrary is the case; reason, science, &c., are more divine (if one thing may be called more divine than another) than prophecy and revelation, because reason and science speak the language of the waking and ordinary state of existence; whereas revelation alludes to a mode of existence with which we are less familiar, but a partial knowledge of which is notwithstanding necessary, before we can have correct views of our own or of universal nature.

The Christian, and Sectarian of every name, worship the God of Darkness,—that is, of mystery,—the God of this world, SATAN. The infidel not only denies his existence, but even his revelations. But to what power he ascribes these things we cannot tell, as upon this subject we never met with an infidel, or an infidel book, which we could understand. Some ascribe them to imagination; but when you push them a little, by asking what imagination is, they cannot tell; their philosophy goes no farther. Yet they are right even in ignorance. It is imagination that creates all these things. But are there not two kinds of imagination—a voluntary and an involuntary? The *voluntary* imagination works in waking or watching; the *involuntary* imagination works in dreaming and vision, &c. The voluntary imagination is what we call "ourselves;" but the involuntary imagination is God, the universal mind. Thus their imagination goes for nothing. It is still inspiration. Some say they are inventions, tricks, &c. But such philosophers are both too illiberal and too ignorant to deserve a reply. They are greater spiritual tyrants than those whom they

would displace, and would restore the barbarism of mid-night if they had their will.

Upon this subject we shall soon explain our own views. The two natures of man to which we have alluded are the two poles of his intellectual existence. By the one he acts as an individual, devises his own plans, and consults his own happiness. By the other he acts as a part of the universal man, or species; does what he knows not the meaning of; and is made instrumental in carrying on a grand mechanical progress of society, which is too vast for him to comprehend, and the ultimatum of which he cannot imagine. This is inspiration, and every individual has it; it is his life and being; he has not even a momentary existence without it; he himself is a blank, a nothing, less than nothing, and vanity.

But there are different kinds of inspiration, as St. Paul observes, though the same spirit. There is an inspiration for politics, and one for ecclesiastics; one for science, and another for art; and innumerable varieties for all the superior and inferior departments of each. All are equally inspired, but the inspiration is different; for one department has been from the beginning the inspiration of somnambulism, and the other of waking.

But which has the greatest light? Each has a light of its own. During the day we see the sun, and all the beauties of earth; but were there no night, we could never have known any thing of the splendid science of astronomy. It is to darkness that we are indebted for our knowledge of the heavens. So also it is with science and revelation. Science reveals all the beauties of external nature; but of the mind it knows nothing, and never could have guessed any thing, had it not been for somnambulism and revelation, which will yet throw a flood of light on that hitherto mysterious subject. Remember that we include dreaming in our somnambule division. Dreaming is ordinary, common-place revelation; vision and prophecy are only a more powerful and systematic operation of the same mysterious cause; and these three have let us into this important fact respecting mind; namely, that there is another power besides the voluntary power, which works by the faculties of the mind, and produces thoughts, words, and actions, in a visionary world, entirely independent of our own will. This bears the same analogy to the individual that the heavens bear to the earth. The heavens surround the earth, and enclose it in their spacious bosom; so also the universal mind encloses the finite mind. But as the light of the sun is more perfect in unity than that of the stars in multiplicity, so also the light of reason in waking life is more luminous and consistent than that of the divided powers of mind in dreaming. The analogy is perfect, and the harmony of Nature demands that dreams, visions, and revelation should all be confused, mysterious, unintelligible things, inferior to the systematic proceedings of reason, but yet necessary to complete the education of man, by instructing him in things which concern himself. For how is it possible that man could have known his *DOUBLE NATURE* without them.

And if he does not know his double nature, he knows nothing but a few discordant facts about geography, geology, chemical action, &c., which leave him in the same

wilderness of chaos in which they first discovered him. In plain terms, revelation teaches the knowledge of God; for by discovering the double nature, we also discover the important and cheering fact, that there is another intelligent power, everlastingly resident within us and about us, in whose infinite bosom we live, move, and have our being. This power is what anatomists call the involuntary principle. Science discovers it in the sympathetic nervous system, without the aid of somnambulism; but without somnambulism it could never have been discovered that it existed in the mind, and thus been demonstrated to be intellectual, moral, and physical; which three epithets are, however, merely one in reality.

Moreover, it was not enough that this secret power should manifest itself in this incoherent manner alone, for it is a systematic intelligent power; but as it is the universal power, this system is shown not in the dreams and visions of the individual, but in the ecclesiastical progress of the species. Hence arises the splendid, unique, single system of religion, which beginning in mystery, and carried on with all the symptoms of unutterable confusion, ends at last in a simple and harmonious union with science itself, upon which it pours a flood of living light.

From this analysis a child may perceive, that science is the individual, and treats of time; revelation is the universal, and treats of eternity; hence, all prophecy, vision, &c., are spiritual. They talk less of the individual than the power that encloses and surrounds him. They talk of futurity, the regeneration of the earth and the species, the prolongation of the one polar being after the decomposition of the other polar being, when the order of things shall be reversed, and the power which we now call the visionary power shall be supreme director, and that which is now supreme director shall be eclipsed.

When science separates itself from revelation, it despises the universal system, and follows after individualities alone; delights in gathering stones, bones, and trinkets; analyses the organizations of matter; and encloses itself within the narrow prison of individualism, by denying all the philosophy of universalism. In this character it becomes infidel; denies the universal mind; denies even the personality of the individual mind itself, and boasts itself of emancipation from superstition, by the rejection of the hope of a prolongation of existence. But in this state it has nothing to boast of that humanity can ever take delight in. It works against the grain. All its cheering prospects are only the gloom of individual despair. All men are not moral and intellectual suicides; few indeed are so; life is pleasant. Nature is wise, and her ways are wonderful. Reason teaches that she will fulfil the hopes that she herself has implanted, and destroy the fears which she herself has created. Reason, therefore—hope—science itself—come all to the side of revelation at last, who is a helpmate to man in his insulated state of individual existence; a helpmate that shows him his connexion with a sublime and eternal principle of life and power; to whom nothing but absolute absurdities are impossible, and in whom good must be superior to evil.

The hopes of revelation are as much to be depended upon as the laws of Nature themselves; they are the pro-

mises of the universal mind, couched in mysterious language it is true, but susceptible only of a good ultimate meaning. Evil is the victim of Nature; good is the victor. All progress is nothing but the gradual or sudden destruction of the one, and the gradual or sudden elevation of the other. Final evil is only consistent in a universe of confusion, where there is no law, no order; but where laws and order reign with infinite precision, there all partial evil must have its termination in universal good. Hope must reign triumphant over fear; life must supersede annihilation; and happiness put a seal upon the tomb of misery. THE SHEPHERD.

LITERATURE.

The Divarication of the New Testament. By Thomas Wirgman, Esq. Second edition. London, 1834. Dedicated to the King.

"This is a gift that I have, simple; a foolish, extravagant spirit, full of forms, figures, shapes, objects, ideas, apprehensions, motions, revolutions: these are begot in the ventricle of memory, nourished in the womb of pia mater, and delivered upon the mellowing of occasion: but the gift is good in those in whom it is acute, and I am thankful for it."—Shakspeare's *Love's Labour Lost*, act iv., scene 2.

Our friend, the Alpine Philosopher, has mentioned in one of his letters a book remarkable for its long preface; the book alluded to is the tri-coloured, gilded, figured, most splendidly printed *Divarication*.

The title of the work is in itself a literary curiosity—*Divarication*: the word is well chosen, a dainty morsel, a gem as it were of grammatical exquisiteness. Bravo, Tom! I shake hands with you. You have out-heroded Herod. The man from whose cloth warehouse you have bought the remnants to make up your variegated dress, called *Divarication*, was famous for adopting words that startled and puzzled his contemporaries; but you have outdone Immanuel Kant himself. *Divarication* means division into two;—mark that, my reader, because the word is of the greatest importance, since it is my intention to *divaricate* the *Divarication*; I will divide it into two elements, namely, the sense, and the nonsense. Whether the nonsense will stand in the same proportion to the sense, as the author's preface stands to his book, that is a question which will be easily settled.

The great object of the author, and a very laudable one, is to bring about a unity of thinking among the different classes of men.

"This unity," the author maintains, "will be produced, if the gospel be divided into two parts—the doctrine and the history."

"All disputes among sectarians are depending on historical controversies: about the doctrine there can be no dispute."

All these propositions are mere assertions, and the book itself is a continual contradiction with the pretensions of the author.

It may be easily granted, that if a doctrine was existing upon which all thinking beings could agree, that this doctrine would likely be the means of uniting men: I say likely, because no doctrine is sufficient to bring

men into harmony. Man is not merely a thinking, but also a feeling and acting being ; and unless a harmony between these three elements of which man is composed be operated, the harmony between men will never be established. Moreover, there are but few who may be brought up to think according to the rules of pure reason ; there are but few who will agree in the same application of pure principles to a whole system of religion, morals, or politics ; and it is not the work of man, but of God and Nature, to operate the harmonious fusion of contending principles.

The very method adopted by the author of dividing the gospel into two elements, one of which is to be left out of consideration, is the stumbling-block of the whole system. Though the doctrinal truth be different from the historical truth, yet it is a truth which must complete the other. For instance, in order that men agree upon the gospel, it is not only necessary that they agree upon the principle of "do unto others as you wish to be done unto yourselves;" but they must also agree upon the question, whether the Christian religion be an historical event, that is, a part of the development of nature, or a mere fiction of designing priests and jugglers. But if pure doctrine alone could effect a unity, the doctrine exposed by the author would never produce it, it being altogether a badly-digested compound of idealism, materialism, atheism, and superstition.

The author has taken for granted, and proposed as an unerring principle, that time and space are two mental recipients ; that is, that there exists no time, no space, no form, nor form-giving principle, but in our mind ; that all sensual apparitions are but illusions. But neither Kant nor his parodist have been able to explain how the mind comes to the consciousness of time and space. It is evident that if time be succession, and space be extension, man needs, for the formation of these two ideas, a third idea—the idea of movement. Now the idea of movement presupposes the idea of something moving ; consequently, the idea of time and space is neither original nor primitive ; but one derived first from the idea of something given, and, secondly, from the idea of something moving. Since all other tenets of the Wirgmanian doctrine are deduced from the hypothesis of the two original recipients ; since it is proved that their pretended originality is a mere gratuitous assertion, the whole system falls to the bottom.

Philosophy, or the science of the sciences, must start from a principle which is evident in itself, that is, which does not admit contradiction. The doctrine of time and space, far from being evident in itself, is in contradiction with itself.

There is but one fundamental principle in philosophy, which is the self-consciousness of "I am." This consciousness manifests itself in two forms—I think, and I will,—which are the two poles of the human mind. This principle is evident to every one who asks his own conscience ; it is true, because the contradiction of this principle is impossible. Who can convince me that I am not, or that I am not thinking, or willing ?

The idealism of the tricoloured philosopher being destroyed, it is easily to be seen that it reduces itself to

mere materialism. If the intuition be any thing that we feel, hear, or touch ; if conception is derived from intuition ; if knowledge be intuition comprehended under conception, all our knowledge is material, and material with a vengeance, being only the knowledge of illusions, arranged under forms which are in themselves not entities.

If the Wirgmanian philosophy is tainted with materialism, it is also cankered with atheism. It is true this speculative philosopher speaks very loudly of God, soul, virtue, &c. ; but let us examine what these words mean, or what value this philosophy attributes to these words.

Eternity is something that is out of time and space ; the soul something out of time and space ; God something out of time and space ; but since our knowledge is intuition, comprehended under conception, we cannot have any knowledge of that which is not received into the imaginary recipients of time and space, and consequently they are not entities.

But here comes the jugglery ; reason forms the idea of the soul, or a substance out of Nature, by connecting substance and accident into infinite and absolute substance. What is that verbiage, but that the reason gives the name of soul to something that does not exist at all ; and the existence of which is a manufacture of the twenty aeronauts, called categories ?

Reason forms the idea of God, or of supreme intelligence out of Nature, by connecting action and reaction into infinite and absolute concurrence. What ! a God out of Nature ? Where is this out ? Where is God ? What is God ?—an absolute nothing ! !

The bigotry of the author is proved by his violent attacks both against popery and against the unitarians, and in fighting against the latter, he shows his total misconception of the question. The question between the unitarian and trinitarian is not, whether the trinity be rational or irrational, but whether it be scriptural or not ; in both points of view the balance in favour of the contending parties is equally suspended.

It is certain that God can be but one principle ; it is also certain that one principle must reveal itself under two different poles, and that the two poles being again united form the triad. It is certain that the Scriptures sometimes manifest the God as the One ; sometimes they represent it under the bipolar form, and sometimes also as a triad ; so that both parties are right and wrong according to the different points of view. But in the scale of progress the unitarians stand higher than their opposers ; because the principle of free enquiry, the love of liberty, and the tendency to ameliorate the situation of mankind, is a leading feature of this sect. Attack upon the unitarians is an attack upon the progress of mankind ; and I verily confess that one of Mr. Channing's sermons, or one single number of the *Shepherd*, is calculated to do more good than all the sophistry of the tri-coloured books, pamphlets, and pamphleteers ; yet, I must confess, that even these sophisms are calculated to promote the cause of progress. Our philosophers and divines have fallen into a state of stagnant milk-and-water self-complacency, so as to believe they have reached the summit of knowledge ; some with Paley in their hand, or the pious tracts under their arm, are looking with contempt at those whom they

call infidels; and the philosophers, inhaling from Tom Paine, Holbach, Voltaire, or the Scotch Reviewers, all their wisdom, are honouring their opposers with the name of deceived fools, or deceiving knaves. It is therefore high time that all sorts of systems, however absurd, be brought to light, in order to bring them back to serious investigation. LYCODES.

PHRENOLOGY.

TO THE EDITOR OF THE SHEPHERD.

FROM the tenor of an article entitled "Phrenology," in No. 12 of the *Shepherd*, one would at once infer that phrenologists, when judging of the mental power of a head, took nothing into account but the *size* of the cerebral development; whereas, exactly the contrary of this is the case. I have never yet met with a work that treated of the fundamental principles of the science, which did not most distinctly state many other particulars to be attended to besides mere size. I might refer your readers to many of the works of British phrenologists, as evidence of the truth of this assertion; but I prefer giving an extract from a work of Dr. Spurzheim, because, being one of the founders of the science, he may be deemed higher authority; besides, it will show that it is not a modern idea, but one that has been before the public a number of years ago:—The Doctor says, "The first point to be considered by the phrenologist is the bodily constitution of the individual subject of observation: whether this is lymphatic, sanguine, bilious, nervous, or is made up by a mixture of these four primitive temperaments. This preliminary step is necessary, in order to enable him to conclude concerning the degree of *activity* possessed by the cerebral organs." Numerous quotations to the same effect might be made, had I the means; but this one is taken only from an extract of the Doctor's work, made by a reviewer, which by good luck I have by me; however, it shows that something else but mere size is attended to. Ask any person who has read any of the phrenological works, if, when treating of the fundamental principle, that "size gives power," the author did not use language similar to this—"The largest brain, *ceteris paribus* (all other conditions equal), is the most powerful?" What other conditions? Why, their "firmness, consistency, and health," to be sure; aye, and something else, which this writer has not noticed, the temperaments. This is what will account for the fact, that "symptoms of intellectual strength may appear even in the midst of intellectual weakness, and *vice versa*, even where individuals have healthy frames." Thus, an individual with a large brain, but of a *lymphatic* temperament, may not show so much mental power as another person with a smaller brain, but of *nervous* temperaments. I have shown that phrenologists do not estimate the intellectual power of a head by size alone, as the article in the *Shepherd* would make one suppose; and if I have succeeded in disabusing the minds of those whose prejudices must, doubtless, have been strengthened by that article, regarding the state of the science at present, my end is attained: so that my meaning is apprehended, the imperfections of my style of writing do not affect me much. However, I may tell

you, by way of excuse, for my love of approbation is large, that, in the course of writing a couple of sentences, the operations of my mind may have been interrupted not less than half a dozen times, and obliged to turn to something else very foreign, you may depend upon it, to phrenology. I will now conclude with an answer as briefly as possible, to, at least, one of the objections preferred by the author of the article:—

"But again," says he, "the phrenologists observe that certain developments of brain are *generally* (always) accompanied with corresponding developments of a particular faculty. We allow this to be correct, and in general we believe it to be so. What is the inference? that this faculty resides in that portion of the skull, and no other? We doubt the accuracy of this reasoning?" Yes, he may doubt it as much as he pleases, and satisfy his doubts as soon as he can; but I beg to differ with him when he says, "We have *similar* indications of mental qualities in the face." We have not *similar* indications; for the one is not essential to the possession of a particular mental quality, whilst the other is. It is not necessary that a person should have a certain form of eyes, nose, or mouth, or even that he should have these organs at all, to be of a generous disposition; but show me a person with a large development of that part of the brain denominated by phrenologists "the organ of acquisitiveness," and a meagre development of that part called "benevolence," and if that individual be of a really generous disposition, I will abandon phrenology as a delusion. "But," he may reply, "you blockhead, have I not told you that there are entire phrenological organs which may be sliced off without much damage?" He may say so, but here again we are at issue: is he not aware that the phrenological organs are double; and that, although one may be sliced off, the other remains? and I have the authority of the first anatomists of the age to state that both organs have never been injured without a corresponding affection of the quality they conferred. That an analogy subsists between the organs of the brain and those of the senses, I have no doubt; and that the annihilation of one eye, one ear, or one nostril, leaves those senses very little impaired, let five minutes' walk along our streets testify. If this writer was acquainted with this answer to the objection, and withheld it, I leave your readers to make their own inference what his organization must be. If he was ignorant of it, he was incompetent to write upon the subject, for this reason, because it is plain he had never investigated it.

London, Jan. 19.

DISSEMINATOR.

[We don't see so much difference between Disseminator and the *Shepherd* as he attempts to make out. The article alluded to did not oppose the phrenology of the cerebral and nervous system; on the contrary, it supported it. It merely sneered a little at the head-and-bump phrenologists, who presume to reveal all the secrets of a man's mind by the shape of his wig alone, without taking his nervous system into consideration. Disseminator has helped us to an apologist in Dr. Spurzheim himself, who says that the phrenologist must not consult the head alone, but the *bodily constitution*, "whether it is lymphatic, sanguine, bilious, nervous, or is made up of a

mixture of these four primitive temperaments." This is perfectly reasonable, but this is not head-and-bump phrenology; this is the phrenology of the whole bodily system, regarding the head as merely the chief, but not the only residence of the intellectual principle. This is *universalism*, the doctrine of the *Shepherd*, who, whenever he uses equivocal language, or falls into individualism or bigotry, may always be brought to his senses again by this one word—*UNIVERSALISM*.—ED.]

THE AGRICULTURAL MAGAZINE.

THIS little work, which is published every fortnight at the small price of Two pence, is well worthy of the patronage of our readers. The information which it contains is good, and such as deserves the confidence of the public, being under the management of men of influence and talent, who have access to the most accredited sources of agricultural and commercial intelligence; and the doctrines which it teaches are liberal and generous, setting forth the claims of industry in so forcible and eloquent a style, as to secure the interest and captivate the hearts of the poor, and the friends of the poor. We like the principle upon which it has set out; namely, the principle of unity between the sons of agriculture and commerce, for the purpose of making a vigorous stand against the monied interest, which is without doubt the greatest political devil with whom we have to contend. Let none of our readers imagine that we are so exclusive and dogmatical as to imagine that the doctrine we teach is the only thing necessary to bring about political reconciliation. We never once entertained such a visionary idea; we are convinced that society cannot be tranquillized without it; but it forms only a part of the great whole, which consists of two grand divisions; namely, politics and ecclesiastics, of which latter alone we principally treat; the other we leave to those who are conversant with its details, and the *Agricultural Magazine* is one of those works which we think are likely to prove useful to the public. We intended to have given an extract from it this week, but we have been compelled to reserve it for our next.

BRITANNIA.—This word, which has employed the conjectures of so many etymologists, none of whom seem to have hit on a probable or satisfactory solution, admits, however, a very natural one, resulting from a plain analytical process:—The syllables *tan* or *tannia* (signifying the land) as in Mauritania, Tingitania, Lusitania, Aquitania, Farsistan, Indostan, Mongolistan, &c., being rejected, the word Britannia is reduced to no more than *Bri*, a word presenting no sense in any known modern or ancient language. But on a further decomposition you discover, that in the original language of Britain, *é*, signified an island (Lhwyd's Dict. p. 71). If then you allow yourself a liberty of judgment, which thousands of examples authorise, to restore the elliptic vowel, between the *B* and the *r*, the vowel *o* will, without any violence, give *Bori*, the northern island, thence Boritannia, and by a contraction common to most languages, Britannia; a name, which in that sense, was also given to Ireland, both the islands being called by many authors, such as Catullus, Pliny, Chrysostom, &c., *Britannia*, in the plural number, or *northern islands*. *Ierne*, another name for Ireland, signifies only the *smaller island*. The Greeks and Romans might have long employed the appellation of Britain, without so much as knowing that it signified a *northern island*. It is on the foot of this etymology, that the Druids, among the various appellations given to them, had that of *Boreadæ*, or perhaps better written *Bor-ei-adæ*, North-islanders.—*Way to Things and Words*.

THE ANTIPHLOGISTIC SYSTEM.

By HENRY SEARLE, Esq.

THE antiphlogistic system of treatment has long been recognised as a standard system; and, as though it were founded on scientific principles and a correct judgment, and had been confirmed by experience, it has been, and continues to be, taught in all medical schools. It may, therefore, appear bold and presumptuous to denounce a system which is upheld by the authority of colleges, recommended by the physicians and surgeons of all hospitals, received by all students in medicine, and acknowledged and employed as the only proper plan of treating inflammatory diseases by the great body of practitioners. Although this system has been pursued for ages, yet it was not generally adopted until after the Brunonian doctrine had given rise to much discussion, and caused much alarm. This doctrine, which was raised with much skill, was expected to subvert the antiphlogistic system; it was, however, based upon false premises, viz., that every individual had a particular quantity of excitability implanted in his frame; that all diseases consisted either in an accumulation, or an exhaustion, of this excitability, constituting either direct or indirect debility, requiring the administration of different degrees of stimulus for their cure, according to the accumulation or exhaustion of the excitability. The excessive stimulation which, in certain cases of inflammation, this doctrine enjoined, proved so destructive to life, that in order to avoid the fatality, the very opposite extreme was soon broached, probably under the impression that truth lay at the farthest point from decided error.

From that period down to the present, the rigid antiphlogistic system of treating inflammatory diseases has prevailed, and the term "antiphlogistic" has not a little tended to perpetuate the system. The terms "fever" and "inflammation" being expressive of heat, antiphlogistic means are considered to be corrective of a phlogistic condition, whether general or partial, of the frame; precisely as antacids are corrective of acidity of the stomach.

Having many years ago relinquished the antiphlogistic system of practice, I feel warranted in asserting, and am fully prepared to maintain, that this system of treating inflammatory diseases is empirical, that it is founded upon no principle of science, and that it need never be had recourse to, even in the most acute forms of disease.

Inflammation, though strictly a local disease, is much disposed to give rise to general excitement (pyrexia); those means, therefore, employed for its removal, which are the most likely to be preventive of the supervention of inflammatory fever, form the most simple and proper method of treatment. Copious bleeding, therefore, which suddenly and considerably reduces the muscular power, and produces a morbid excitability of the whole frame; also violent purgatives, and poor liquid diet, which derange the functions of the viscera, and thereby afford an additional local exciting cause, should be most carefully avoided. But the more usual and general practice, founded upon the strict antiphlogistic system, is, of all others, the most certain of impairing the muscular power, and of deranging the functions of the viscera; in short, of giving rise to pyrexia, of converting a simple local disease into a disease of the most complicated, and often of a dangerous form, and of undermining a constitution which otherwise might have remained sound.

The merits of bleeding may be stated in a few words. The abstraction of twelve or sixteen ounces of blood very often removes at once a recent inflammatory affection; no means could have done more, and probably none so speedily; and, further, when venesection does not com-

pletely stop the inflammatory action, it almost invariably subdues it for a certain time, and if this immediate relief were the sole effect of general bleeding, no reasonable argument could be brought against it. This benefit, however, must not be allowed to disguise the more remote influence of the practice upon the constitution.

When venesection completely removes the inflammation, it is evident that the inflammatory affection is not very strong; it is, therefore, fair to suppose that the milder agency of a few leeches, or of a blister, would answer the same purpose, and without impairing the constitution. Some, it is true, are not injured by a *single* bleeding; but, observation will convince any one who is not already assured of the fact, that those who are relieved from an attack of inflammation by general bleeding, are much more liable to recurrence of the complaint on some future occasion, than those who are relieved by local means only.

The influence which considerable losses of blood have upon the human frame, is to render it less muscular, and to induce corpulency. People who are disposed to be corpulent, become more so after having lost much blood; and, with this view, horses which are put up for sale are phlebotomised, to make them appear sleek and in good condition. Bleeding also induces dropsy among the corpulent, and others whose constitutions have already been impaired by dissipation or by prior disease.

In those instances in which the abstraction of blood does not remove the inflammation, but merely affords temporary relief, it becomes injurious, by suddenly reducing the muscular power, and thereby increasing proportionately the excitability of the whole frame, which then becomes irritated by the local affection, and fever supervenes; the inflammation assumes a more acute form, the pulse rises, and the whole character of the disorder is considered indicative of the necessity of a further bleeding. This being performed, faintness is produced, the pulse is controlled, the pain nearly ceases, and, to all appearance, the disease subsides; sometimes, indeed, it does not return; but it too often happens that reaction takes place, and with it all the symptoms are renewed with increased violence; another bleeding is resorted to with the same temporary relief; but the reaction which now ensues is in general less complete; if delirium existed before, it is increased; the countenance is sunken and anxious; the whole nervous system appears to have received a fatal shock; and the pulse, in this condition of the patient, frequently assumes the jerking character. That this state of the pulse is induced by the repeated losses of blood, appears to have been satisfactorily proved by Parry's experiments.

The attempt to reduce very high action suddenly, is a violation of one of the laws of the animal economy, so well illustrated by Mr. Hunter; it is not only unscientific, but often dangerous, either to the function of an organ, or the life of a part. It may even occasion death. For instance, persons who have been much excited by hope, have become deranged on being disappointed; life has been extinguished within an hour after sudden exposure to intense cold; and parts which have been frozen, have mortified on being too abruptly exposed to the influence of heat.

It is strange that this law should not be recognized in the treatment of inflammatory diseases. It frequently happens that when a serous membrane is actually inflamed, its vessels sink into a state of atony on being too suddenly deprived of power, and a rapid serous effusion ensues. Every body who has been much engaged in practice can recal to his mind cases, especially in corpulent

persons and *bons vivans*, of acute attacks of pleurisy, in which large quantities of blood have been abstracted, and in which the patients in a day or two afterwards have been reduced to a hopeless state from hydrothorax. Royalty has not escaped subjection to this unscientific practice.

If the pulse do not rise after the first bleeding, a repetition of the operation is not recommended. The rising of the pulse is the golden rule which is thought to have justified the first bleeding, and to warrant its repetition. This rule, however, is fallacious; the rising of the pulse, which is considered a sign of strength, is, in fact, an evidence of debility, being a sign of excited action under diminished power. Too much stress cannot be laid upon the fallacy of this criterion, as the lives of myriads are balanced upon this critical point.

By way of illustration, it may be useful to describe a case of every day occurrence. Let it be supposed that a patient has for several days been suffering from hepatitis. There has been no pyrexia, and the pulse is still moderate; "half measures," as they are called, have been employed by the medical attendant, which have lessened, although they have not removed the inflammation. A physician is then called in, and the patient is freely bled, with immediate relief; in the night delirium, &c., comes on; and in the morning the disease is found to have assumed an acute character, accompanied by general excitement,—*the pulse has risen*, being full, quick, and energetic. Without proceeding further with the case, it may not be improper, in this place, to repeat the observations often made on these occasions by those who recommended this change from "half measures" to the strict antiphlogistic measures:—"Ah, I suspected that there was more inflammatory action going on than you were aware of; this patient should have been bled earlier; these attacks come on so insidiously, that they often deceive older heads than yours."

A man who is strongly prejudiced in favour of the antiphlogistic treatment, is blind to the simple fact that, notwithstanding the strong inflammatory diathesis apparent in such cases, so long as the powers of the body are not impaired by the "half measures," the inflammation is controlled, although not removed; but that so soon as the patient is deprived of his natural power by bleeding, &c., the inflammation, not being removed, involves in its morbid action the whole frame. The junior practitioner should be cautioned against these mystifications. Perhaps, in his modesty, he at once foregoes the evidence of his own senses, and reproaches himself with the want of that shrewdness which would have enabled him to detect the "insidious" character of inflammatory disorders, and, for the future, abandons his own more sound philosophy, to search for diseases in a "masked" form. This term is used when the *pulse rises* after bleeding; and when the inflammation, which was all but smothered in embryo, springs forth with the freedom of unrestrained action, displaying the boasted utility of venesection, while, in fact, the new features of the disease, which are in reality the only mask, are induced by the loss of blood. Yet, if the candidate for his diploma were to dissent from this scholastic dogma—this supposed indication for bleeding, he would be rejected as unfit to be entrusted with the lives of his fellow-creatures.

Purgative medicines and *sparæ diet* are measures which form parts of the antiphlogistic system, and are as objectionable as general bleeding, for they produce not only debility, but also dyspepsia, with all its inconveniences, and, often, delirium, and sleepless nights. *Rest* is also injurious in cases of inflammation. In health, *exercise* is allowed to give general circulation to

the blood, and in disease it decidedly tends to prevent, or to correct, the local accumulation of blood at the seat of the phlegmasia. *Rest* is, therefore, improper, so long as the invalid is capable of attending to his usual avocation.

The antiphlogistic treatment by some is not confined to inflammatory complaints, but is adopted in almost all other cases, with the view of preventing inflammation and fever. It is not surprising that those who pursue this system so indiscriminately, should be constantly apprehending the supervention of fever; for the very means they employ as preventives are the most likely to occasion it, so that their daily practice more and more confirms their apprehensions, which would be perfectly groundless under a different method of treatment. For instance, if means were taken to preserve the muscular power, instead of to impair it, the body would remain firm and unexcitable under all circumstances short of very acute disease. It is extraordinary that any argument to this effect should be necessary, it being so generally admitted that irritability exists in proportion to debility. What is pyrexia, but the general excitement of an irritable frame? And thousands there are, who, having been subjected to the antiphlogistic treatment for the removal of an inflammatory disease, have become so excitable, that a glass of wine, or a small quantity of animal food, produces fever for several hours; this effect, which ought to be expected but not dreaded, determines the invalid to avoid a similar indulgence until he is quite recovered. Habit, however, becomes in time second nature; the invalid virtually remains a convalescent during the rest of his life, ever finding that a small quantity of stimulating food induces temporary fever; and so long as he continues thus over-anxious to prevent the recurrence of disease, he actually prevents the recurrence of health; he becomes a perfect hot-house plant, liable to be influenced by every slight change of weather, clothing, or diet. It is astonishing that the common sense of the patient does not interdict such super-refinement of the medical art.

The antiphlogistic treatment impairs the tone of the heart and blood-vessels, as well as the general muscular system, laying the foundation for hemorrhages, which are perpetuated, the constitution becoming completely undermined, by persisting in the same method of treatment. Much more might be said of the injurious tendency of this system.

The treatment of febrile and inflammatory disorders ought to be reconsidered by the profession. If proper care were taken to ascertain their causes, and a plan of treatment adopted in strict reference to their respective effects, a really scientific system of practice might be established; it would then be found that some cases require a very different plan of management from others, and that in comparatively few instances would the acute form of disease appear. When prejudice in favour of the antiphlogistic system is removed, it will be found that there are no instances, excepting in dislocations, and one or two others, in which the muscular power ought to be reduced by the loss of blood; and when the antiphlogistic treatment shall become obsolete, mankind will be relieved from more than half the ailments to which it is at present subject.—*The Lancet*.

ATHEISM AGAIN.

WE must submit one more view of Nature to those who call themselves by the name of atheists, and then we shall have done with them till some new and unexpected motive presents itself.

The atheist denies the intelligence and design of Nature, but he does not deny the adaptation of things to an

end; thus, the eye is adapted for seeing, the ear for hearing, the heart, arteries, and veins for circulation, and all the parts of the human system are adapted for some useful purpose. The same law prevails throughout the whole animal and vegetable world. Take, then, this law, which no man, believer or infidel, disputes, and apply it to the universal man or species, and you come to the following conclusion: namely, that all the great and small institutions and systems of human society may at least have an equally systematic and mechanical character as functions of the universal man, tending to a result as unique and beneficial to the whole system as the acts of digestion and deglutition in the individual system. This is what we maintain; and even an atheist, after he has proved that there is neither God nor mind in the universe, even an atheist, cannot oppose it; for, if it be true of individual man, why should it not be true of the species or society? Nay, we will go much farther, for an atheist, granting him all he contends for, namely, the annihilation of Nature's intelligence does not thereby disprove the reality of revelation, inspiration, prophecy, &c.; for if there are visions imposed upon the mind in sleep, against the consent of the will, as every one knows, and broad day-light visions imposed upon invalids and phrenetics, as every physician can testify; and if in these dreams and visions figures are introduced which speak and do many strange things, over which the dreamer and visionary have no control, what right has any man of common charity to deny that all the dreams and visions of the prophets are correct? Not even an atheist has a right to say nay to them, for certainly the properties of matter, which are the only gods which he worships (only he believes them to be *dead*), were quite as visionary in former days as at present, and quite as able to effect the one as the other.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

CORRESPONDENTS.

A Barker we shall remember next week, although we must confess that we think he has been making distinctions without differences. He and W. N. are quite at one. For the Barker acknowledges that mind and matter are not two distinct things, but a consistent whole. This is nothing else but the doctrine of mentalism differently expressed; but it is a very curious thing, that whilst a materialist claims to himself the privilege of speaking of matter as if it were the only existence, he will not allow the spiritualist the same privilege, although he has an equal right to it. A Barker is a genuine disciple of Berkeley, without knowing it; for Berkeley's doctrine is nothing more than this, that mind and matter are one universal entity, manifesting itself in an infinite variety of ways.

J. S. we have received.

Bankhead is very complimentary and sarcastic.

The Alpine Philosopher has been omitted by mistake.

We shall notice the Southcotian article next week.

P. A. S. next week.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 24.]

SATURDAY, FEBRUARY 7, 1835.

[Price 1d.]

SYSTEM OF NATURE.

LAST week we gave the elements of the subject of Inspiration or Revelation, when we showed that not only the Jewish and Christian Scriptures, but also all other prophetic and mystical writings, which have formed the faith of the different religions of the world, were given by direct revelation; there being no other craft employed on the part of the writer than that exclusiveness of opinion which prompts him to employ the same dark and equivocal language in defending and illustrating his doctrine, which is employed by the original involuntary power which conveyed it. Finding that power to be dark, cunning, and impenetrable, and regarding it with a peculiar veneration, as the *beau ideal* of every virtue, he forms his own subordinate character upon this model of obscurity; and, without any intention to deceive or injure, may frequently be guilty of prevarication or deception to forward what he esteems the cause of everlasting truth. Hence the origin of *holy frauds* to support a system of mystery, which men are convinced is of peculiarly divine origin, but which from its obscurity is unintelligible to all, and rejected by many.

The simplicity and accuracy of reasoning which characterized the prophets is worthy of attention. It is evident that sound sense was not wholly extinguished by the mystic power; though persuaded to submit to a superior influence, of whose distinctness from Nature, education and mystery itself had taught them to entertain erroneous notions, which impressed them with fear, there still, at times, broke out the dissatisfaction of a correct judgment, which never could heartily concur with the literal meaning of the word itself. Thus Esdras says to the angel, "It were better that we did not exist at all, than that we should live still in wickedness, and suffer, and not know wherefore." The angel not giving him satisfaction (and what angel ever did give a satisfactory answer?) he says, "I have said before, and now do speak, and will speak it also hereafter, that there be many more of them which perish, than of them which shall be saved." But the Lord gives him no satisfaction; he only tells him not to be over-curious about the manner in which the wicked shall be punished; but in the usual style of double dealing, he both declares they shall and shall not be punished; for when the prophet (viii. 36.) says, very justly, that God's righteousness and goodness would be declared if he had mercy on the wicked, the Lord replies, "*Some things thou hast spoken aright, for I will not think on the disposition of them who have sinned before death, before judgment, before destruction.*" This is plain enough;

but then at other times the Lord is full of threats, denunciations, &c., so terrific and indiscriminate as to swear destruction to the whole human race, both righteous and wicked (see Ezekiel xxi.); and the poor fellows, not aware of the bipolar or double character of the philosophy of Nature, or the law of God, could not unriddle the mystery, which is exceedingly simple; and, resolving to err on the safe side, faithfully and strenuously preached the terrors of the Lord. The wisdom of Nature is evident in this; for if these terrors had not been preached in days of scientific ignorance and rudeness, there is no calculating the amount of mischief which would have resulted from the doctrine of universal redemption, which is only safe amongst an intelligent and refined population.

We have to combat with the old Christians on the one hand, and the infidels on the other, respecting this doctrine of "universal inspiration." The Christian will admit of no inspiration out of the bounds of the Bible. With him the Koran is a specimen of black, diabolical imposture, and the writings of Joanna Southcote are members of the same family of Beelzebub. The infidel holds the Bible in the same light as the Christian holds the Koran. This is merely the law of retaliation, and a good specimen of the justice of Nature in measuring out to men as they have meted out to others. In opposing both these parties, we do not need to employ two different kinds of arguments. They both belong to the same school of infidelity, inasmuch as both parties deny the systematic arrangement of the great plan of discipline which Nature has pursued towards the human race. How superior is a mere savage in reason to both! When the wife of the Chippewa chief was on her death-bed in London, on the 18th ult., she said she was not afraid to die, and would not take any medicine, for it was the will of the Great Spirit to remove her. This was nothing, however, to what follows. Understanding that she would not be honoured with a respectable burial in consecrated ground unless she became a Christian, she willingly consented to submit to the innocent ceremonial of baptism, convinced that the Great Spirit was universal in his operations, and not the exclusive God of any people or creed. She was a universalist at heart. She died in peace, in faith, and in hope. Millions in this very island may regard her as accursed, and deplore the profound darkness of her native tribe; they may send missionaries to convert her people, and infuse what they call the spirit of a superior doctrine. But the teachers themselves are as blind as the pupils; and success to their mission would be the introduction of sectarian hatred and social misery. The infidel would extinguish the faith, and the hope, and

destroy for ever the filial and paternal tie that connects the Great Spirit of Nature with these simple worshippers of the universal God. But God hath set bounds to these two apostles of partial and exclusive views; to these bounds they shall go, but no farther; here shall their proud waves be stayed. But where are the bounds to universalism? Where is the pasture on which it cannot feed? Where is the doctrine from which it cannot receive life and nourishment? Be it a mighty river, or merely a little purling brook of mystery, it matters not; it still belongs to the great ocean of mind, from whence it came at first, and whither it shall return again. Some streams are clearer than others; some waters are purer than others; some are fitted for navigation and commerce, and others are merely useful to supply the larger channels with water; but *all* the streams have this *one* peculiarity about them—they want the salt, the principle of immortality. All fresh water is corruptible; it merely lasts for a short time. If exposed to the air it putrifies and becomes nauseous; nor can it ever recover its purity until it has mingled with the waters of universalism in the salt and incorruptible ocean. So it is with the creeds and systems of individualism; they all come from the same great salted fountain, and in that salted fountain it is their final destiny to be united again. Now it is river against river, and brook against brook; but in a very little while all brooks and rivers shall be one. "All the rivers run into the sea; to the place from whence the rivers came thither they return again." "Salt is good, but if the salt has lost its savour wherewith shall ye season it? Have salt in yourselves, and have peace one with another."

Some have adduced the fact of the resemblance between the Jewish or Christian dispensation and other systems of religion in the world, as proof of the non-inspiration of the Scriptures!! They might just as well have adduced the equally certain fact of the resemblance between the waters of the Nile and the Thames, as a proof that they did not come from the sea. Their arguments are a curious specimen of the perversion of reason and the infatuation of party spirit. Circumcision, they say, was practised by the Egyptians and Ethiopians long before the time of Moses. The history of creation, as given by Moses, is found in the cosmogony of the Parsees, almost identically the same as the latter. The story of the ark and the dove is found in the Egyptian rites and ceremonies, and the fables of the Greeks. The festival of the ark was celebrated by the Romans, and set down in the calendar for the month of March. The virgin and the child were known over all the East, and the story of Jesus and Mary is almost identical with that of Christa and his mother. The sign of the cross was practised by the worshippers of Serapis, in Egypt, long before the coming of Christ. Baptism and the Lord's supper are merely imitations or modifications of heathen mysteries, &c. In other words, the Copernican system is false, for Pythagoras taught it two thousand years before Copernicus! All these arguments only prove the universality of the book, and the ideas which it contains; being a gathering of the elements of the human mind, as it has manifested itself in all countries and in all

ages, and therefore the better qualified for becoming what we are certain it will become—the nucleus for collecting the residue of every people, the standard around which all the scattered families of the earth shall gather; for every people will there find so much of its own doctrine and spirit as to give it the preference over every other proffered mediator.

The French infidels of the last century, Volney, Dupuis, and others, suggested that the secret of the biblical fable, as they called it, might all be found in the science of astronomy; and many of them pursued the study so far as to find the most remarkable coincidences between the book and the science; they then very boldly concluded that the writers were astronomers, and had disguised the science under the veil of history. Never was a more absurd idea ever concocted than this frantic conceit of credulity and illiberality. History is entirely silent upon the subject, and nature never once produced any other phenomenon analogous to it; but it answered a purpose of party at the time, and it was backed both by learning and genius. It was true so far as the resemblance between the book and the science was concerned, and much more true than these philosophers were aware of, for the book is an astronomical allegory throughout; but it is also chemical, botanical, magnetical, and, after all, is as true as any other history which is partly true and partly false. It is the book of Nature, and therefore an emblem of herself.

It was concluded from the splendid astronomical allegories and exact coincidences, many of which our readers may find in Dupuis and Taylor, that the individuals who wrote the books must have had the system in their minds. Do men reason so respecting a language or a grammar? Do we ever imagine that the original framers of the English language had all the rules of Murray's Grammar in their heads, and that they conjugated verbs, and declined nouns, and made distinctions between regular verbs and irregular verbs, as boys do at school? No, indeed! the language is first formed, and then the rules are discovered; not the rules first, and the language afterwards. It is said of the Sanscrit language, the sacred language of the Brahmins, that it is so thoroughly analysed, or reduced to its first principles, that by taking a single root in the language, you may, by means of artificial rules, make out a thousand different words from that root alone: are we to infer that the Brahmins invented this language merely because the rules are so exceedingly nice, and the fabric so systematic? No, indeed; the rules are posterior to the language; the language grew like any other production of nature, by the ignorant and unconscious combination of individuals; but in the end it assumed a systematic form, and now constitutes a regular science. So it is with revelation. It has a large development like a language, but in the end it assumes the same artificial character; and men, ignorant of the bipolar character of nature, denying the universal mind, and dreaming of nothing but individual consciousness, resort to the absurd and uncharitable hypothesis of fraud and deception to account for the system which they discover amid the apparent chaos. The little they see makes them illiberal and rash; a

little more insight will change their ideas, and discover the secret of the universal mind, and universal inspiration.

But all these negative doctrines do good at last. They first destroy the old exclusive system, and then they themselves are destroyed by one still more comprehensive. Nature has three great stages, through which she carries each and all: there is first a false affirmative, then a false negative; then there is the combining doctrine, which destroys the error by destroying the partiality and exclusiveness of both.

All religious doctrines are universal; they are neither local nor temporal, but omnipresent and eternal. Those doctrines which refer to space and time, and individuals, such as the history of the Jews, Jesus Christ, &c., are merely local; they are types or figures of universal truths; which universal truths can never be affected by the truth or falsehood of the local truths; but the local truths are the progressive and successive development of universalism, working its way from the lowest stage of ignorance up to the highest standard of intellectual improvement. They, therefore, who deny the local, temporary, and historical truths, deny the doctrine of the progressive development of nature, or intellectual, political, and ecclesiastical geology; which being the science of the past, and the foundation of human experience and foresight, must, if excluded from any pretended system of nature, exclude all the elements of human education. Besides, any system of philosophy which cannot systematise the proceedings of the past into as compact and mechanical an arrangement as a human body itself, is merely a burlesque of science; and he who calls himself a universalist, whilst he superciliously sneers at all the ravings of humanity, and the mystic principles which have in all ages commanded the reverence of the public mind,—that man is merely a conceited and illiberal theorist, whose universe, like the world of Sterne's midwife, is enclosed within the narrow compass of a few miles diameter. Nothing is universalism but that which embraces all and systematises all.

Nor is that which is most contemptible in the sight of men the least valuable in reality. We find the type in the latest discoveries of science, which has just now discovered that all manner of filth and putrefaction, which nauseates the senses even of the brute creation, will furnish abundant means for supplying us with a commodity (indigo) which has hitherto been regarded as one of the treasures of the East, and could only be reared in a rich soil and a warm, genial climate. The same may be said of the gas-man's lime-water, which was so abominable that he was prohibited from either committing it to the sewers or burying it under ground. Necessity compelled him to try evaporation, and he discovered an extremely useful assistant in blowing up his fires and preserving his bars. Now he does not want to get rid of his lime-water.

"What's Smith about now?" says a liberal. "What have the liberals to do with Joanna Southcote and such trash; let us cast all these things into the trough." And who is to clean the trough after it is filled, Mr. Liberal? and who is to purify the atmosphere, when the buried lime-water ascends in vapour, and enters the nostrils of the liberals above ground? Is it not better to decompose

the lime-water, and to extract indigo from the filth, and thus remove the corruption and increase the wealth of society by one and the same act? What say you to this, Mr. Liberal? You are merely a scavenger, after all; a scavenger, too, with a larger stock than you can dispose of; for your liberalism makes filth of all the elements of mind, except the chaos of your own unarranged ideas. And if you cast all this filth into the trough, we fear some moral and intellectual plague will be the consequence. However, you entirely overrate your power; you are just as likely to be the patient as the agent in this affair of the trough,—to be cast in, as to cast,—unless you fall into the hands of men of sense, who will decompose the unfavourable mixture of your nature, and transform you into a UNIVERSAL CHEMIST. THE SHEPHERD.

FROM THE AGRICULTURAL MAGAZINE.

SIR,—I have read the *Agricultural Magazine*, and am much pleased to find a publication professing sentiments therein contained, patronized by gentlemen of such talent and influence as those whose names I see attached to the work. I beg to observe that in a work of this kind, evidently established on real patriotic principles, it will be most advisable to abstain from any discussion which may have a tendency to mislead or misdirect the attention of the labouring public.

With respect to taxes—*heavy taxation and light taxation* are relative terms: many a man is oppressed and ground down as it were now, by paying about five pounds a-year in taxes under a villanous contraction of the currency, who has paid twenty pounds a-year without feeling it when the currency bore a just proportion to the produce of the country. So it is with the price of corn; hundreds of thousands are suffering the pains of starvation with wheat at forty shillings a quarter, who lived in comfort and happiness when it was double that price. All taxes are virtually paid in the produce of the country; they cannot be paid by any other means; money is merely the medium through which they are paid; and they are oppressive or not, as a moderate or exorbitant part of a man's labour may be necessary to procure in money the amount of those taxes.

It shows a most milky weakness to expect relief by a reduction of the *nominal* amount of taxes when the *real amount* is increased four or five-fold; the people have been humbugged by reduction of taxes many years, and they are so still, when it is evident to any man of common sense, who thinks upon the subject, that, notwithstanding they have been reduced at least one half, he has to give four or five times as much labour for taxes now as he had when we were spending more than one hundred a-year!!! It is amazing that this plain self-evident fact alone does not at once strike the mind of every man.

It is now well ascertained, and pretty generally understood, that the prosperity of the manufacturing and agricultural part of the nation go hand in hand together; therefore it is immaterial, and not worth discussion, whether the prosperity of manufacturers arises from the prosperity of farmers, or *vice versa*: but, as England is an importer of corn, and an exporter of manufactures,

it follows as the night follows the day, that the prosperity of farmers is in consequence of, and not the cause of, the prosperity of those engaged in manufactures.

I perceive a part of your columns is occupied in examinations about the evils arising from machinery worked by steam. Whether injurious or not, that art is brought into existence, and no power on earth can stop it; if put down in one country, it would rise up in another, therefore it is irrevocably fixed so long as civilized society is held together; so that when seeking a remedy for present evils, we must leave steam-engines entirely out of the question. I must here take the liberty of observing that a new era is arising in the science of political economy, and that there are axioms in politics as well as in mathematics, some of which I will enumerate: 1st. A free country can never be oppressed by REAL TAXATION so long as no able-bodied man is found in it wanting employment. 2nd. Prices are always in proportion to the money in circulation. 3d. A National Debt can never be greater than the country's means of paying it. 4th. All money borrowed by government is money lent to the people; that is to say, the people have only to pay the interest of the money borrowed instead of the money itself. 5th. A country's debt can never increase without the means of paying that debt increasing in an equal ratio. 6th. Government have the means, through the agency of the currency, to keep prices at a remunerating standard, without fixing a maximum or a minimum.

These axioms are as clear to my mind, as that a whole is equal to all its parts; and I do not hesitate to say that, as England has at the present time carried its mechanic arts to greater perfection than at any former period, she has the means of affording greater happiness to the people now, than she ever had before: we have the necessities of life, and the luxuries of the world, in profusion around us, while the people are starving for want of food, and farmers going to ruin for want of their custom—our shops and warehouses are overloaded with goods, and the people are without clothing—stocking makers without stockings, and tailors in rags—was ever such an anomaly known before? And all for want of maintaining that just proportion between the produce of the country and the circulating medium, which Peel's Bill completely destroyed: what must that man think of himself? If he be not callous to every feeling of humanity, he must be stung with remorse. If that due proportion were maintained, the steam-engine would be one of our greatest blessings; should it not be restored, steam-engines will ruin the country. And to preserve that proportion whilst we have a gold legal tender is impossible. Any man who has paid attention to the evidence before the different finance Committees, will see that if we had gold enough this week, we might have a scarcity next; Rothschild, Baring, Haldinand, and others, proved that gold, both coin and bullion, was as much an article of commerce as any of our manufactures; that the Bank of England could raise or lower the price of gold at pleasure; that it was sent out of the country in enormous quantities to be coined into foreign money; that sending a few wagon loads of sovereigns out of the country was thought no more of by the Jews and Jobbers than a farmer thinks of

sending a load of barley to a neighbouring market town. This, and a great deal more, will be found proved, by any man who will take the trouble of reading the evidence; and as the legal tender is the measure of value of all marketable articles, the property of every man is at the mercy, in some degree, of a comparatively small number of monied Jews in this and the neighbouring countries—*quod est admodum nefandum*, and the indestructible nature of gold will render this wholesale system of swindling permanent, so long as gold remains a legal tender.

To obviate this evil, and fix the currency of this country upon a basis co-secure with the monarchy itself, nothing more is wanting than to make the legal tender to consist of the paper of the state; let the Government issue a hundred millions of 1l. exchequer bills, and make them legal tender, and make that sort of money the only legal tender, and leave the trade of banking quite unshackled, with this proviso, that all bank paper should be convertible into legal tender on demand; let Government do this, and as money is the arterial blood of the body politic, this small alteration alone in our financial system would put new life and vigour into every department of agriculture, trade, and manufactures; and would ultimately afford us effectual relief.

I would risk my life upon the successful issue of this measure: but an efficient alteration in the currency will never take place, so long as the public press is galled and warped by the manacles which the powerful monied interest and political partizans have put upon it. Rothschild has boasted for years that the newspaper press of Europe is subservient to him; and the *leading Journal of Europe*, as its Editor impudently called it, has a face with a very dark shade among the English negroes who are the slaves of this infernal system; and the only antidote to the poison which these hirelings have so industriously disseminated, is the wholesome advice of a free press, established under the influence of pure patriotism.

The monied interest, as it is called, have the principal newspapers of Europe under their control. Whigs, Tories, and Radicals, have their papers; religious sectarians have theirs also: and what is most lamentable, they all seem to have conspired together, and placed themselves in battle array, to trample upon the rights, insult the feelings, and blast the happiness of the whole agricultural and manufacturing race; and they, poor devils, tamely lie down and suffer this degrading treatment, without making a single manly effort to rebel them, although they have the means within their grasp of dispersing their oppressors at pleasure, driving them like sheep before the dogs, and scattering them in all directions: this they could do by the agency of the press above alluded to.

Local papers of this sort ought to be established by subscription in every county in England, which might be done with most trifling exertion on the part of influential men; let them be established upon the principle, and that alone, of protecting the agricultural and manufacturing interest—not to be made a trade of, nor prostituted to party purposes; let them be sold at a price that would leave no profit beyond unavoidable expenses and interest.

of capital employed; newspapers of this sort would have most extensive circulation; would disseminate sound patriotic doctrine, and would in the end crown our efforts with success. Requesting the insertion of this letter in the *Agricultural Magazine* the first convenient opportunity, I am, Sir, your very humble servant,

THOMAS WARSOP.

Nottingham, Dec. 1, 1834.

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER VI.

"Alterius non sit qui suus esse potest."—PARACELSUS.
"Be not a copy if thou canst be an original."

IN the house of my parents there was a room called the library, the walls of which were ornamented with prints, each print representing the effigies of some learned man. Here lived in peaceful harmony men of the most opposite opinions, Luther and Calvin, Hogstraten and Servetus, Dante and Pope Boniface, Cujace and Puffendorf, Machiavelli and Savonarola, Wicliff, and Cardinal Bellarmine, Galen and Van Helmont, and many others whom I scarcely can recollect. Yet, among this worthy assembly, there was a man whose countenance is constantly present to my imagination, namely, Theophrastus Bombastus Paracelsus.

The reason why this man's physiognomy made such a powerful impression upon my mind is not so much owing to the originality of his features as to the originality of the motto which is annexed to his print; which motto pleased me so much that I adopted it as my own. To this circumstance I owe my first acquaintance with the science of Nature. It is quite natural that, fond as I was of the motto of this extraordinary man, I was also interested to make a nearer acquaintance with him by reading his works, his life, his opinions. This study involved me in a series of researches of the most curious kind; and I must candidly confess that I regard Paracelsus as one of my greatest benefactors. From him I learnt to seek for knowledge in the great book of Nature; he taught me to dispose of the pretended wisdom of the schools, and to strive to become myself a master of that philosophy which does not deal with empty names and forms, but draws its nourishing milk from the everflowing, refreshing brook of life.

Paracelsus is the father of modern chemistry, and of the science of magnetism; he has shared with all men of genius the fate of being persecuted and misrepresented by his contemporaries. I have visited his tomb in Salzburg. Over his tomb hangs his portrait, over which is the motto, which I have adopted as my own, and stands at the head of this letter.

To-day I will entertain my readers with the phenomena of magnetic or telluric treatment. I know that my statements will draw upon me the censure of being either a deceiver or a dupe; yet I stand boldly as the defender of truth; I relate not opinions, but facts; for these facts I have not only the evidence of the greatest philosophers and physicians of Germany, Sweden, Denmark, Russia, and Holland, but I have also my own experience. I have myself exercised this art for five years,

and collected a great number of data, which I shall lay before the public in some future letters. Indeed, I am so convinced of the truth of these facts, that I offer myself to treat magnetically any case of disease that should be entrusted to my care. I will show to the public that all the phenomena are not only possible, but true.

The magnetical phenomena are produced by the concentration of the will, by manipulation, and by the baquet, or other solar or telluric influences of those substances, the diagram of which is annexed to this letter. Each of these means may produce the same phenomena, but the phenomena vary according to the nature of the disease; and indeed they are varying almost in every individual, both in intensity and in form.

But since all diversity in Nature has a tendency to uniformity and unity, the differences may be reduced to a kind of systematic classification. The most general result of the magnetic treatment is the cure of all diseases, even of those that have hitherto baffled the skill of medical art.

The diseases of the sensitive and reproductive systems are those which have offered the most luminous instances of the efficacy of the telluric treatment; all sorts of nervous diseases, tetanus, St. Vitus's dance, epilepsy, paralysis general and partial, tic dolooureux, convulsions, blindness, deafness, lameness, all forms of scrofula, and cutaneous diseases, all sorts of hemorrhoids and constipations, and fevers. All these species of diseases have disappeared under the magnetic treatment, either without any critical revolution or metastasis, or by means of critical perspirations, issues, &c. For instance, a lady, who, for seven years, had suffered mortal pains under the influence of the most violent migraine, was perfectly restored to health by means of animal magnetism, this treatment causing an erysipilas, which had been improperly cured, to reappear. A similar instance of improperly-cured cutaneous disease, that caused monthly epileptic attacks, was discovered by magnetism. After a few weeks telluric treatment under the baquet, the cutaneous disease reappeared, and the patient was cured of epilepsy; by continuing the magnetic treatment, the cutaneous disease was also subdued.

But in most instances the magnetic treatment causes other phenomena. The first degree of magnetical action shows itself by a kind of uneasiness, nausea, or yawning. The second degree shows itself to the patient by his being compelled to shut his eyes. Sometimes, after two or three days' treatment, the patient falls asleep, overpowered by the magnetic influence.

Third degree.—The sleep becomes more intense, and begins to transform itself into somnambulism. In this state the patient is opening and shutting his eyes as if in a convulsive state; he begins to be insensible for any thing around him except for the magnetiser; he begins to contract the lips as if to speak, but he is unable to do so.

Fourth degree.—The telluric life manifests itself by a deeper somnambulism; the patient begins to speak some broken words, and to direct the mode of manipulation; his first want is for magnetic water.

Fifth degree.—Confirmed somnambulism. The somnambulist begins, as it were, to live his second life; the strongest sympathy towards the magnetiser shows itself; the voice becomes more harmonious, the language purer; the antipathy towards other persons present shows itself also. In these stages the sensitive and perceptive faculties forsake the usual organs, and concentrate themselves in one focus, the plexus solaris. (The plexus solaris is a kind of bundle of nerves, united

in a kind of globes, of the substance of the brain, placed in the cavity of the stomach). A word spoken to this part is heard by the somnambulist, though the loudest sounds have no effect upon his ear. In this stage the somnambulist begins to acquire the power of examining himself; it is the first stage of instinctive self-intuition. Many have decided with the accuracy of a dissector the internal structure of their body, and indicated the site of their disease; they have determined before-hand the whole or a part of the course of their cure, and foretold the attacks several months before to a minute.

Sixth degree.—All those phenomena announced before in a more intense degree. In this state the somnambulist is able to prescribe for himself and for others.

Seventh degree.—The last degree is that of the ecstasy or clairvoyance. This stage, though the rarest, is one of the most wonderful. The somnambulist does not only hear, but also sees and smells with the stomach. Sometimes he sees and smells with the finger-tips and with the crown of the head.

Time and space have no more limits for the perceptive faculties. They view things passing at a distance, and foretell things which have to pass in the future. The dependence under which they have been placed under the magnetiser, seems to change into a powerful action and reaction; so that often they read the magnetiser's most secret thoughts. Sometimes the two beings seem to have but one thought; in this state the somnambulists do not only predict and prescribe their cure, but also they prescribe the cure of others who live at a great distance. But how will our readers startle when I tell them that the somnambulists, in this state, have also caused distant persons to see their apparitions, and to have exercised their magic influence over distant friends, so as to advise them in visions of threatening dangers! A peculiar feature of this stage is the highly religious feeling that is evinced in them.

The spiritual life, as feeling itself free from the enchainment to which it is bound, seems to soar higher and higher to the living source of life and of bliss, that is, the soul of souls, whose name is unknown, but whose life is creation, intelligence, and love, and whose existence is manifested in its bipolar revelation.

O that I could bring before the believers and unbelievers the somnambulists in their degree of ecstasy, and ask them where is that unfeeling, fatal goddess, which they call Nature, or where is that tormenting, evil principle, whom blind fanaticism worships as God!

O there is a God; but God is the One:

He is the life, the love, and the light.

THE ALPINE PHILOSOPHER.

SOUTHCOTIANS.

TO THE EDITOR OF THE SHEPHERD.

SIR,—On reading No. 21, Jan. 17th, on the Southcotian Doctrine, I was much struck with many of your observations, as the sense of them came so near to the words of the Spirit that visited Joanna Southcote, whose works I have in my possession, and some which have never yet been printed. If I understand you aright, you conceive, taking the world at large, the existing order of things is about to have a change, and that mankind will bend to that which shall prove to be good. If this is your idea, so said the Spirit to Joanna Southcote in the year 1805, from a simple type, wherein the Spirit said, "Men under their different forms of the Christian religion, were once good, as cucumbers are good if plucked in season, but good for nothing if left too long on the ground, and are rotten. Just so," said the Spirit, "are the different creeds; now I, God, am about to change all, and make man as I first made him, good, very good. The different sects are out of season, and rotten by their own prejudice in favour of their own creeds, and will not receive the truth now handed to them." This appears to me to your reasoning thoughts on the present appearances in the world, and from which you conceive there will be two opposite principles at work, as opposite to each other as the poles, one of which will carry the palm. This must be done then in the broad face of day, and the Lord has ordered us, who believe in the divine mission of Joanna Southcote, not to use any of our own wisdom, but to fight with the words of the Spirit, given to his handmaid Joanna. We now joyfully come forward to meet the world, being fully convinced, if we wield the sword of the Spirit aright, it will cut down all opposed to it. Under this impression my motto is, "Remove the cause, and the effect will cease."

The communication enclosed which I have sent you will fully justify my motto. THOS. MALBY, SEN.
22d Jan. 1835.

[We insert Mr. Malby's letter with pleasure, but he must excuse us from inserting the long communication from Joanna's writings. We have all the published works of Joanna in our possession; we have read them, and are quite as familiar with all the Southcotian doctrines as with those of the old school of Christianity, but we have not yet sufficiently prepared the minds of our readers for such a species of food, which we ourselves can easily digest, but against which the public stomach always rises at first sight. Mr. Malby and his friends (we also call them our friends till they prove otherwise) should remember what havoc has been played in the Church of the Woman by the imprudent zeal of her nominal followers, boring the "word" into unwilling ears, and raving, and screaming, and canting, in all places, and under all circumstances; thinking to accomplish by blind enthusiasm alone, what nothing but moderation and a sound mind can ever succeed in effecting. Witness the folly of Mr. Halhed in Parliament in the case of Richard Brothers; witness the prepossessions and foolish reasonings of the believers in respect to their Mother's death, and the appearance of the child; witness the folly of George Turner's followers in 1817, when they expected the nation to be suddenly revolutionized, and themselves as suddenly exalted; and let them compare these and many other similar events with what their

"Mother" has told them—that the kingdom of God should come in a very simple manner; so simple, that men should say, "What fools we all were not to perceive it!"

All those who depart from the simplicity of Nature must be confounded. God is the God of Nature. The Lord rejoices in his works and in his laws, which are the laws of Nature; and these laws will bring round the great deliverance without any of those marvellous occurrences which many look for. Nor are the Southcotians alone to be instrumental in bringing it about. They will do an important work we allow; more, much more, than the world are aware of; but their work is but part of a whole, and until they join that part to the universal mass, they will be in a state of deep somnambulism or mental delusion, with all the features of truth, and many of the fulfilments of partial predictions. When God made the woman, he brought her to the man, and the man said, "this is bone of my bone, and flesh of my flesh." Revelation is the woman, but science is the male, and until revelation effects a marriage-union with science, both parties are in utter darkness.

Our friend says that the Spirit has ordered them not to use any other weapons but those of the Woman's revelations. Does he know who the Woman is? Joanna is Joh. Anna, the Grace of God. Let him use the spirit of Anna, for it is the spirit of grace, of gentleness, and love, which will teach him the doctrine of social union and brotherhood; but let him not mistake the type for the substance; this is the error of all former creeds. They have all been erected upon the principle of individualism or idolatry; attaching so much importance to the persons of men and women that they have unconsciously apostatized from one of the sublimest features of their own doctrines, namely, the universality of the Spirit. "Cursed is the man who trusteth in man, or maketh flesh his hope." "Cease ye from man, whose breath is in his nostrils, for wherein is he to be accounted of?" The meaning of these words is obvious; it is the doctrine of principles, not of persons—of God, not of man. Every principle is God, because every principle is a law of Nature. To follow principles, therefore, is to follow God, and to worship God. To follow bad, and false, and exclusive principles, is to follow the God of this world; but to follow good, true, and universal principles, is to follow the God of the world to come. To cast off our own wisdom, then, is nothing more than to abandon individualism; and to follow universalism is the same thing as clothing ourselves with the whole armour of God. This is the end; all previous sects, creeds, &c., are merely types and harbingers of the UNIVERSAL WORD.

Of these types there was one originated in England about the middle of last century by Anne Lee, a prophetess, who, after suffering much persecution in Lancashire, embarked for America with her followers, and founded the sect of Shakers in the New World. This is one of the finest types of the new system of Christianity which exists. Of course, as a type, it is full of imperfections; but the brotherhood, community of interest, industry, prosperity, and stability, which characterize the institution, place it in the very foremost ranks of the millennial precursors. It is merely a political type, however; no new truth was made known to it. The Southcotians are very different; they are infinitely divided—have no brotherhood amongst them; but they have a progressive principle in their church, which the others have not; which, while it benefits them not in a temporal sense, will by-and-by make the moderate and enlightened amongst them extremely useful and successful reformers.

But there are furious bigots in the flock, who think themselves holier than all others, and wiser than all others. These are the dross, the fuel of the great conflagration of evil, which is just beginning to overspread the world of morality, faith, and intelligence.—ED.]

THE DOCTRINE OF THE "WOMAN."

NO. II.

LAST week but one we gave a general outline of the doctrine of the Woman, which is nothing else than a completion of the sexual character of revelation and progress; and so exceedingly simple and evident to those who have studied nature in this systematic manner, that they must see at once the necessity of such a doctrine to terminate the career of the old system of philosophy and religion.

Of infidelity and mere rationalism, remember, we are not speaking at present. We are on the opposite side of the river. We are tracing the progress of revelation in its distinct and independent character, having no connexion whatsoever with the political or scientific world. Revelation and mysticism are a distinct department of Nature. Being the very opposite pole to rationalism, or material science, it is natural to suppose that it should always be conducted by the poor and illiterate. And this has been the case in all ages. All prophets, apostles, and great religious reformers, were poor and illiterate, especially when they professed to have direct revelations. The reformation of Protestantism was a reformation of criticism, not a revelation.

Hence it follows that learning, science, elegance of speech, and artificial nicety of reasoning, would be out of place in such a line of progress. These belong to what we may call rationalism. Accordingly we find very great inaccuracy of language, bad taste, disconnected sentences, and illogical conclusions, universally characteristic of all inspired writings. The language of the Bible is well known to all, and the original is worse than the translation. Of the Hebrew we can say little, for we have no other book to compare it with; but the Greek is as much inferior to polite, classical Greek, as Scotch is to English. The verbal faults of the Bible are very respectably covered by our beautiful English translation; but its logical faults could not be concealed, and these are very glaring. Where, for instance, could we find a more unmeaning sentence than the following:—"There is no end of all the people, even of all that have been before them. They also that come after shall not rejoice in him"? Eccles. iv. 16; or where could you find a more foolish and illiterate sentence than this of Moses:—"Ye shall be sold unto your enemies for bondmen and bondwomen, and no man shall buy you"? Deut. xxviii. 68. These are merely specimens of hundreds, thousands of others, that might be enumerated, which are irrefragable evidence to all but sworn enemies to plain truth, that the literary and logical character of revelation is of a very inferior character. It has a peculiar forte of its own, however; it excels in glowing descriptions of futurity, and in richness of poetic imagery. In other words, it excels in imagination, and is deficient in reason.

These remarks we have made to prepare the reader for what follows respecting the writings of modern prophets, who have generally been despised more for their language than for any other deficiency. But it was always a true saying, that a "prophet has no honour in his own country." Why? Because in reality he is a mere simpleton, and only becomes sublime and reverend by the influence of the *unknown*, and the power of the imagination.

Taking all these things into account, we ask what au-

thority the bishops and Christian world had to reject the mission of Joanna Southcote? It was by no means surprising that infidels should reject it; for they have entirely deserted, both really and nominally, the sphere of thought in which she moved; and as she had proceeded almost as far as possible in the opposite direction of politics and science, they were more likely to listen to a voice from the wilderness of Gobi, than to the incoherent illogical effusions of such a seer of visions. But the bishops, to whom revelation professionally belongs, would not even enquire, they would not grant her a hearing. She professed to have a message from God; they would not listen. She promised to give them evidence; they treated her with scorn, and would not answer her letters. Therefore wrath was pronounced upon them and the church. In this, at least, the old lady will be found a true prophetess.

Now all this is but a repetition of the treatment of prophets in all ages. They were all contemptible to the great men of the day. The people for a time abetted the great in their persecution; by-and-by the persecutors fell into contempt, and the memory of their victims was treated with popular favour. "That which has been shall be again, for there is no new thing under the sun."

Joanna herself was as illiberal and intolerant as those who persecuted her. Her followers are equally intolerant and bigoted as herself. All men and women must be illiberal and uncharitable until they become UNIVERSALISTS. In fact, as the progress of faith moves on, it seems to catch more and more of this peculiarity of exclusiveness. However, there is one kind atonement which the Southcotians have made for their other faults, and that is the entire rejection of the doctrine of eternal punishments, which are designed for devils (*evil principles*) alone, and not for men and women.

In analysing this church, we care not for the individual opinions contained in it; they are all as foolish as FOLLY himself. We look merely to the writings, which we regard as divine, and by these writings we are willing to stand or fall, and yield when we are beat by a quotation from Joanna. The marrow of the doctrine we shall very soon bring out, and then our readers will perceive its use in the economy of Nature.

EXTRACT FROM A LETTER OF P. A. S.

TO THE EDITOR OF THE SHEPHERD.

"SIR,—Pardon a woman, an ardent admirer of your production, seeking truth, and taking the liberty of addressing you. From the commencement of the *Shepherd* I have never failed to read it, when circumstances would permit me. The truth of its doctrines I am prepared to confirm by the same book from which you draw your conclusions. The thoughts your *Shepherd* is intended to convey were mine long before that admirable little work made its appearance; and pardon me, Sir, when I say that I felt a little envy at your giving publicity to my ideas before I had an opportunity to do it for myself; and yet, Sir, I differ from you on two material points."

P. A. S. then proceeds to argue, in a very correct and intelligible manner, in opposition, as she supposes, to our views of the progress of mankind. But we are quite of the same mind as herself; we never said that the world would be destroyed at the end of the millennium, or indeed ever destroyed, or that man would ever attain to perfection. In speaking, at an evening lecture, of the number seven, we observed that, at the end of the millennium, some new dispensation or reorganization of the world would, in all probability, take place: we compared

it to the musical octave, and adduced the 20th chapter of Revelation as a scriptural proof, which says, "And, when the thousand years are expired, Satan shall be loosed out of his prison, &c." But we never presumed to put a stop to the progress of mankind. Her reasoning is equally correct in respect to a sentence in a former number of the *Shepherd*, where we said that "men had shed their blood for opinion in all ages, and will do so for ever;" that is, if there be no uniting doctrine to reconcile them; but we always teach in the *Shepherd* that they will be reconciled. P. A. S. ought to have known this, and taken the sentence as conditional. Having made these remarks, and entirely agreeing with our correspondent—at the same time pleased with the interest she takes in the subject, and the knowledge she possesses, we do not require to publish her letter. P. A. S. has been in the school of the prophets—so much the better; but she ought to have known that a woman could not propound the doctrine of universalism before a man. A woman will finish it. There is no occasion for envy.

CHIPS OF THE OLD BLOCK.—Every evening during Lent the young children of Greek families go to the door of the Christian houses, and with a monotonous chaunt, which might be taken for lamentation, demand wood, or money to buy wood. "Give, give," they say, "and next year your children will be married, and their days will be prosperous, and you will live long to witness their happiness." The wood that these children ask is designed to burn the Jews. It is on the evening of Holy Thursday that the young Greeks kindle their fires, [and every little troop has its own pile. They dress a straw figure in the Jewish costume, and the victim in effigy is then brought to the place of execution, amid shouts and hisses. The children deliberate gravely on the kind of punishment to which the Israelite should be condemned; some say, "Crucify him, he has crucified Jesus;" others, "Cut off his beard and his hands, and then behead him;" others, "Cut him down—tear him to pieces, for he has slain our God." The chief of the troop then interferes: "What need is there," he says, "to have recourse to all these punishments? Is there not a fire kindled? Burn the Jew." The imaginary Jew is then cast into the flames, and the children exclaim: "O fire, fire, spare him not; devour him; he has buffeted Jesus Christ, he has nailed his hands and his feet;" and the children thus enumerate all the sufferings which the Jews made our Saviour endure. When the victim is consumed, they throw the ashes to the winds with bitter execrations, and each returns home satisfied that he has taken vengeance on the murderer of Christ. Have not such customs their character imprinted on them?—and do they not give rise to very serious reflections?—*Travels in Palestine by M. Poujoulat.*

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

A LECTURE upon Tellurism, or Animal Magnetism, by THE ALPINE PHILOSOPHER, at the request of the "Society for the Acquisition of Useful Knowledge," on Tuesday evening, the 10th inst., at Eight o'clock, at 36, Castle-street East, Oxford Market.—Admittance Free.

CORRESPONDENTS.

Having another correspondent on the same subject for next week, we hope a Barker of our Flock will excuse us this week.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 25.]

SATURDAY, FEBRUARY 14, 1835.

[Price 1d.]

SYSTEM OF NATURE.

WE are very apt to be misunderstood, merely because our mode of reasoning is somewhat singular. When we speak well or ill of particular systems and institutions, our language must always admit of large qualifications and exceptions; for there is no institution founded upon the individual or exclusive system which does not contain within it much of both good and evil. In our last we used some language which might be interpreted by our readers as implying a reprobation or contempt of the spirit and purpose of those societies which aim at the propagation of Christianity in foreign countries, and perhaps many concluded that we utterly despised them, and regarded them as more pernicious than beneficial. If so, they were much mistaken; we are much more liberal and universal in our views than to confine the progress of the human mind to the narrow-minded policy of a little sect, which monopolizes truth and humanity to itself. Progress and truth are universal.

Notwithstanding the ungenerous and sectarian views of those societies (the Missionary, Bible, and Tract Societies), and our firm persuasion of the speedy dissolution of the whole mystical fabric, which they assiduously support, we regard with peculiar interest and satisfaction the work in which they are engaged, and hail their success as an omen of future good. They are the glory of our own and other Christian lands. But our readers will understand our meaning better after we have given them a few extracts from the reports. As our limits are very confined, we shall take a few extracts from the reports of the "Religious Tract Society" alone.

This Society was established in 1799, and circulates in about *seventy-five* different languages the immense number of fifteen millions of tracts and little books, &c., per annum, at home and abroad. But it is to the foreign circulation alone that we wish to direct the reader's attention, as that is what we call the good department of the society's operations. Abroad, they are the movement party—*innovators*; at home, they are the stagnant party—*supporters of error and corruption*. The difference is infinite.

We quote from the thirty-third annual Report (1832) the following, respecting the Burmese, which is exceedingly interesting:—

"The Burmans," remarks Dr. Judson, "are a reading people, beyond almost any other eastern nation. Probably nine-tenths of the male population throughout the country can read. [They are also a careful, deliberate people, who turn a thing over many times before they take

it. They are not disposed to give much credit to the words of a missionary; but when a "tract" is put into their hands, they wrap it up carefully, deposit it in a fold of the waistcloth or turban, carry it home to their village, however distant, and when a leisure evening occurs, the family lamp is produced; the man, his wife, and relations gather around, and the contents of the new writing receive a full discussion. I need not add, that such a people present the strongest claims upon tract societies. One press at Maulmein has been in operation about a year; but such is the demand at both our stations, and every where, that Mr. Bennett, our printer, who came out with the hope of speedily printing the New Testament, sees himself every moment farther removed from the attainment of his wishes. Our tracts are pervading the whole country, from the frontiers of China to the banks of the Ganges, and from the borders of Cassay to the most southern village of British Pegu."

One press cannot supply the demands, and Dr. Judson himself requires 1000 per week, for persons who call at his house. More printers and presses have been sent out. The Rev. Jonathan Wade writes that the natives come for tracts from all parts of the country, and that the demand is much greater than the missionaries can supply.

"We frequently hear with what avidity they are read in those places which they have reached. Numbers who live several days' journey from this place have called, and said, 'We have heard the fame of this religion, and are come to hear and get books.'"

"At Rangoon," says Dr. Judson, "is a pagoda where the Burmans believe several *real* hairs of Guadama are enshrined: here they hold an annual festival. During the last festival I have given away nearly ten thousand tracts, giving to none but those who asked; and I should have given away double the number could I have obtained sufficient supplies. I presume there were six thousand applicants at my house, and their remarks and enquiries were often of the most interesting kind. Some of them come *two or three months' journey*, from the borders of Siam and China. 'Sir,' said a pilgrim, 'we hear that there is an eternal hell; we are afraid of it. Do give us a writing that will tell us how to escape it.' Others come from the frontiers of Cassay, one hundred miles north of Ava. 'Sir, we have seen a writing that tells about the eternal God. Are you the man that gives away such writings? If so, pray give us one, for we want to *know the truth* before we die.' Others came from the interior of the country, where the name of Jesus is little known. 'Are you Jesus Christ's man?' they enquired. 'Give us a writing that tells about Jesus Christ.'

"His Majesty has banished me from Prome, and has forbidden me advancing above Rangoon. He has levelled our brick house at Ava to the ground. But on the subject of tracts the government appears to be quite indifferent. If there should be no government prohibition, and we could be furnished with the means of throwing in an incessant flood of tracts for three years, I should hope, from what I know of the habits of the people, that Boodhism would be shaken to its base."

These facts are most important, and must excite the interest of every liberal and comprehensive mind. But there are few minds who are deserving of such epithets, and consequently few who regard these intellectual movements of the spirit of the age in their proper light. The Papist is alarmed, because they are not Catholic tracts; the Protestant is exceedingly anxious about the orthodoxy of the new converts, measuring always the immensity of the universe by the standard of his own littleness; the infidel turns up the lip of contempt, and, like Judas Iscariot of old, he says, "Might not this have been sold for two hundred pence, and given to the poor?" We differ from all these sectarians. We regard the work as a great and interesting stage in the progress of humanity; and although we are sensible that the tracts themselves are exceedingly feeble and foolish things, when compared to the greater light which is in the world, yet they are not so when compared to the absurdities of heathenism, but are admirably calculated to invigorate the thinking faculties, by causing first doubts, and then enquiries, and last of all, free discussion, amongst the idolators of the East. They are an intelligent, shrewd people,—they can read,—they are willing to hear something new. In fine, they are in a proper frame of mind for subverting the old oriental superstitions, and the Tract Society is the instrument of the universal spirit for effecting this great work. When the British nation has advanced a step further in religious knowledge, the tracts will then assume a new character, and the old exclusiveness and bigotry of Christianity will give way before the cheering beams of universal faith and universal charity.

Of the effects upon the priesthood the following extract from Mr. Clough's report from Ceylon will give some information:—

"The whole of the first edition of the *Tract against Boodhism* was disposed of in about a fortnight after its publication, and demands are now made upon me from every quarter. One missionary writes me, 'The demand for your tract against Boodhism is so great at my station that I could dispose of several thousand copies with the best effect. Do, do send me as many as you can spare.' Similar reports and similar demands come from almost every other station, and we have therefore put in hand another edition of six thousand copies. I regret I have not time to send you extracts from the many letters I have received as to the general excitement which has been produced by this tract. But I am given to understand that the priests are thrown into a state of general consternation, and convocations of them are held in every district for the purpose of consulting on the best plans to check its circulation, and counteract its influence amongst the people. In one place the priests resolved to unite in

a body, and appeal to the government to request that it might be forcibly put down; and I suspect they will do this. In another district the priests resolved to collect as many copies as they could, and publicly burn them. In a convocation of about thirty of the priests that was held about seventeen or eighteen miles from Colombo, I understand their feelings were so outrageous that they threatened personal violence to the author. In another of the convocations, I understand, it was resolved to answer the book. This I should like to see, as it would give one further hold of them; and, I doubt not, furnish fresh materials from their own system, by which to give it another and more severe scourging. On Saturday last, one of our schoolmasters informed us that an assembly of the priests had sat several days in a temple at a neighbouring village, deliberating on the subject, and that the assembly broke up, after resolving that, the book being unanswerable, it was best to let it alone. Our assistant missionary at Belligam states that at that place a priest, after reading the essay, resolved to renounce Boodhism. Upon the whole, I think the present is one of the most favourable opportunities I have ever known for the distribution of tracts in the native languages. Heathenism in all its forms seems to be making a grand effort. The commotion in all directions is singular and extraordinary. Would to God that it were the struggle of its death!"

It is evident that a singular change has affected the minds of the whole population of the world within the last few years. It reminds us of those expressions of the Bible which represent the Lord as awaking like one out of sleep in the latter days, and going forth as a mighty man to do his work, his strange work; "to gather all nations together, and plead with them in the valley of Jehoshaphat," i. e. the valley of judgment, where the human mind shall call all opinions before the bar of reason, separate the good from the bad, and establish truth and righteousness for ever. "And this gospel of the kingdom shall be preached unto all the world, for a witness unto all nations, and then shall the end come." End of what? End of the whole mystery of antichrist, or first Christianity, which must spread its wings over the whole world before it be glorified, that is, destroyed; for the new world is merely the old refined and purified.

It is amusing and instructive to see how the great spirit works with all the different wheels of his magnificent engine, how the priests of one country are made instrumental in overthrowing the priests of another country; and the former, though victors abroad, baffled and vanquished in return at home. The priests of old Christianity are the leaders of the movement in foreign countries; but there is a spirit of Reformation in Christendom itself which leaves these reformers of heathenism and idolatry far behind it. They have no idea of progression; no idea of even the possibility of a new truth or a new idea being added to the old stock of scholastic theology, unless Jesus Christ, in person, come down from the clouds, with a host of archangels and departed spirits, to announce it; for God knows that, if a specimen of the old prophets were to appear with a leathern girdle and a hairy garment, and preach repentance to the bishops and archdeacons, as the Baptist of old, he would meet with a

very sorry reception—he would not even obtain a crust of bread from a clergyman's pantry. Against this spirit of stagnation and corruption, the spirit of infidelity has been aroused, and the effect in Europe has been prodigious; the priesthood is daily losing ground, and a universal scattering of mind is taking place. This latter effect is, however, not the end; the people must be gathered again; this gathering requires a new spirit, a new doctrine, a new principle of reasoning, a principle of greater liberality than that of either the old believer or the infidel—a principle which will reconcile the faith and the hopes of humanity with the utmost degree of liberality and scientific knowledge. This principle is universalism, to which every other principle is subordinate, and of which all exclusive and partial systems, either of affirmation or negation, are only the temporary forerunners: this is the sea into which all the rivers run.

It remains now just to say a few words about the home circulation of the tracts, and this will fairly balance the two extremes of good and evil. These tracts are by no means calculated for the spirit of our population; no doubt they affect many, and convert some; Mahometan tracts will do the same. They convince some simple souls that they are great sinners, that the Holy Ghost is very angry with them, and that the jaws of hell are gaping to devour them. This conviction being produced, the poor creatures read a chapter, and pray upon their knees, look very sad, and go to church on a Sunday; and this is called by the tract-men "winning souls to Christ," and "plucking brands out of the burning." All this, we acknowledge, is produced, and when it is produced upon dissolute characters, drunkards, debauchees, swearers, liars, &c., it is good, inasmuch as it is better for men and women to be troubling themselves with religious melancholy than annoying the community with disgusting vices; but when the simple, the cheerful, the light-hearted, and innocent are caught by these nets of the arch-enemy of human happiness, we deplore the result. This is often the case; but more frequently the tract is either used as waste-paper, or its stale advice and obsolete cant pass by the ears of the listless reader like the idle wind, which he regards not. Of the home distribution little good can be said, and therefore, even the reports say as little as possible; they must say something, but even that something is conjecture. Abroad, the tracts are amongst the people what the unstamped and radical press is amongst ourselves; and the priests are thus guilty of a most glaring inconsistency in encouraging and practising rebellion and infidelity in other countries, whilst they reprobate, in unmeasured terms, the equally conscientious and successful innovators who oppose them at home. The argument against rebellion and innovation, therefore, comes with very bad grace from the mouth of the priest or Christian of any denomination, for all parties belong to the great "Propaganda Fide," and aim a deadly blow at all the religions of the world. What else do we? Our aim is the same as theirs, and our justification the same, namely, our own conviction. But there is a mighty difference between us, for whilst they regard us with abhorrence, enemies of God and deserted by his spirit, we view them as instruments in the power of the Great Spirit, for doing a work of twilight, which must be accomplished to usher in the daylight of the Sun of Righteousness.

THE SHEPHERD.

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER VII.

"E più si muove!"—GALILEO.
"And yet it moves!"

IF I should be asked whether the great discoveries in arts and sciences are owing to the superior intelligence of men, or to some peculiar revelation of God, my plain answer would be, "Most surely, the greatest discoveries owe their existence to God's revelation." Indeed, the intelligence of individuals is, in regard to the absolute divine intelligence, nothing but the organs by which and through which the great act of revelation is performed. It is therefore but a vulgar error to ascribe all discoveries to mere accident; as if, in a world in which the least atoms are, in their movements, attractions, repulsions, combinations, compositions, and decompositions, birth, growth, death, and reproduction, subjected to the eternal law of bipolarity; I say, it is as if, in a world where the spirit of God is daily, hourly, yea, at every minute, repeating the work of creation, any thing could happen like chance or accident! And most surely it was not a blind chance, but a wise divine decree, which caused the discovery of animal magnetism to be revealed to a physician, at an epoch in which the generality of physicians and philosophers had been the most active instruments in spreading that system which considers matter as the only principle of life.

Frederick Anthony Mesmer, the discoverer of animal magnetism, was born on the 3th of May, 1737, at Stein, a small town of Switzerland, situated on the banks of the Rhine. In his earliest youth he evinced a great fondness for the study of nature; he told me that, when a boy, his greatest pleasure was to retire into solitary spots, and there to amuse himself in contemplating the operations of insects, the flight of birds, and in comparing the different shapes of plants, and herbs, and mosses. He remained often out in the fields till late in the night, when the rising of the stars and the moon filled his mind with deep sacred feelings. "I was then," said he, "under the magnetical influence of Nature; the full flood was streaming above, below, and around me. My mind was full; but I did not know what was working in me."

His parents, who were respectable, though not wealthy, discovered in Anthony a great fondness for natural science, and used their greatest efforts to make him a physician. After completing his preparatory studies at the Swiss schools, he was sent to Vienna to study medicine. At that time the university of Vienna enjoyed a high reputation as a medical school. His professors were Van Swieten and Haen.

He studied with great application, and in the year 1766 he obtained the degree of M.D., on which occasion he began to show his lofty and independent mind. A youth, in the presence of professors, who were incarnate fact-and-experiment-mongers, in a town and in a century in which nothing but tangible theories were admitted as true, Mesmer published a pamphlet, in which he attempted to demonstrate the influence of the planets upon the human body. All his acquaintances, his masters, in-

deed the whole tribe of fashionable professors, philosophers, and literati, were so indignant at what they called an attempt to bring back old ignorance and superstition, that they turned their backs upon him, and designated him as half diseased in his mind.

Mesmer laughed at his scoffers, and settled himself as a physician in the Austrian capital. There he began to study deeper and deeper the science of Nature; and by endeavouring to trace one universal principle of life, which could be employed as a principle of cure, he first took electricity to be this principle. Instructed by experience of the fallacy of this surmise, he turned his enquiries towards metallic magnetism; and, after having devoted his attention to it, he began to try experiments with the artificial loadstone, for which purpose he procured magnets of different forms and dimensions, which he first applied to the cure of local diseases, and afterwards to the cure of nervous affections.

His attempts succeeded; and in the year 1775 he laid his discoveries open to the world. But the world was not willing to receive them. He was treated both as a fool and a dupe; which opposition, however, instead of deterring, strengthened Mesmer in his endeavours.

In the meanwhile several people of quality applied for his magnetic assistance, and several happy cures put him in the situation of forming a private hospital. Here, whilst treating some patients with the artificial loadstone, he noticed some phenomena of somnambulism. He observed more closely, and saw that these phenomena were not accidental, but dependent upon the magnetic treatment. Finally, by repeated trials, he found that the artificial magnet was quite unnecessary for the production of these phenomena; and all at once his eyes were opened, and the divine thought flashed into his mind; the universal fluid or flood was found; he named it "Animal Magnetism."

After this great discovery, Mesmer assumed the airs of a magician, and began to perform his cures under a veil of mystery, through which no one was able to penetrate. Some believed that he was working his cures by concealed loadstones; others, that he used some new hidden electrical apparatus. The alchemists swore he had found the philosophers' stone; bigots said he had a compact with the devil; unbelievers accused him of being a cheat and impostor.

Mesmer paid little attention to these calumnies, but continued his practice with great success. This, however, excited the envy of the whole profession; and having injured the pecuniary interests of the emperor's head physician, the miracle-doctor, being a foreigner, was most graciously ordered to quit Vienna within twenty-four hours, and to keep clear of the imperial dominions for ever! Indeed, such was the fury of the profession against magnetism, that a law was enacted by which physicians and surgeons were prohibited from magnetising, under the penalty of forfeiting their licence, and the profane were forbidden under a severe corporal punishment. Consequently, he left Vienna in 1777, and, after visiting his native land, came, in February, 1779, to Paris.

The learned men of that capital had bent their views in quite an opposite direction; instead of finding support,

he was laughed at as a dreamer. But his energy being unrelenting, he at length succeeded in gaining the support of Dr. D'Esion, a member of the faculty of Paris. Under the auspices of this physician, he published, in the year 1779, his first memoir on animal magnetism.

The science being yet in its infancy, Mesmer's theory could be no otherwise than a mixture of error and truth. It was the following:—

"There is a reciprocal influence (action and reaction) between the planets, the earth, and animated nature." (True.)

"The means of operating this action and reaction is a most fine, subtile fluid, which penetrates everything, and is capable of receiving and communicating all kinds of motions and impressions." (Fanciful.)

"This is brought about by mechanical, but, as yet, unknown laws." (False.)

"The reciprocal effects are analogous to the ebb and flow." (Beautiful analogy! the germ of the theory of polarity.)

"The properties of matter and of organisation depend upon reciprocal action." (True.)

"This fluid exercises an immediate action on the nerves, with which it embodies itself, and produces in the human body phenomena similar to those of the loadstone; that is, polarity and inclination." (Here was the great mistake of Mesmer, of confounding the original law of polarity and life, with the effect of a particular fluid.)

"Hence the name of animal magnetism." (A wrong name.)

"This fluid flows with the greatest quickness from body to body, acts at a distance, and is reflected by the mirror like light; and it is strengthened and propagated by sound." (The truth of these facts is undeniable, but only to be explained by the telluric and solar influences.)

"There are animated bodies which exercise an action directly opposite to animal magnetism. Their presence alone is capable of destroying the effect of magnetism. This power is also a positive power." (How can there be two positive powers, one opposite to the other?)

"By means of animal magnetism, we can effect an immediate cure of the nervous diseases, and a mediate cure of all other disorders; indeed, it explains the action of the medicaments, and operates the crisis." (True, if properly explained.)

"The physician can discover by magnetism the nature of the most complicated diseases." (True, if the fact of somnambulism had been proved.)

If the French philosophers and physicians had not been blinded by the prejudices of the schools, they would have discovered amidst the errors of the theories of Mesmer some luminous truths, which would have led them to the enquiry into those facts which he covered under a magical veil. Instead, however, of examining Mesmer's system, they rejected it altogether as a nonentity; and such was the stupidity of those preachers of liberty that they turned their fury even against Mesmer's friend, Dr. D'Esion. They deprived him, for a year, of his voice in the college of medicine, and threatened into the bargain to expel him from the faculty if he continued to defend Mesmer's doctrine. But this brutal attempt to oppress the

new discovery did not succeed. Mesmer having performed some remarkable cures, which were made public by his patients, animal magnetism was established for ever. In a short time he had realized by his cures the sum of 400,000 francs. The treatment was still practised under a mysterious form; and the knowledge of the hidden parts of the system, namely, somnambulism, was communicated to adepts, who, after having paid a certain sum, were received into a kind of magical or medical free-masonry. The adepts formed several societies, called "Harmonies." Among the most ardent and benevolent followers of Mesmer were the Marquis of Puységur, Caullet de VeauMOREL, Petetin, and Bergasse. Magnetic societies were soon spread over France, where some still exist. The success of Mesmer daily increasing, the government of France appointed two commissions to examine his discoveries, but the commissioners being altogether prejudiced against it, gave a most partial and unsatisfactory verdict. Jussieu, the great botanist, was the only one who gave himself the trouble to examine the facts, and he was so entirely convinced, that he published his opinion in contradiction to the verdict of the commissioners. The college of physicians, in the joy of the triumph obtained, again attacked EsLON, who had opened a magnetical establishment in opposition to Mesmer. They caused his name to be erased from the list of members of the college, and obtained a royal ordonnance, by which he and his pupils were prohibited from performing magnetical cures.

These measures, instead of producing the desired effect, increased the number of the followers and defenders of the new doctrine. Mesmer became, at the same time, the object of the most superstitious idolatry, and of the most fanatical persecution. His friends, of both sexes, wore his portrait on bracelets, brooches, snuff-boxes, seals, &c.; and the press teemed with works for and against Mesmerism.

In the meanwhile, the French revolution burst forth like a roaring tempest; and Mesmer, who foresaw all the terrible consequences of this event, left France, and retired to his native land, where he remained in perfect seclusion, and continued to elaborate in silence his system, and to cultivate a little estate, "*procul negotiis, ut prisca gens mortalium.*" Here also he wrote a most interesting work, a kind of political medicine, in which he first gave birth to ideas which bear a great similarity with those advocated by modern Utopists.

Whilst Mesmer lived in retirement, insulated, as it were, from all the scientific world, the sciences were making in Germany the most astonishing progress. The spirit of philosophical enquiry had penetrated into all branches of medicine. All facts, all experiences, all theories, were put in the crucible of criticism; nothing escaped the penetrating, truth-seeking, independent genius of the Germans. How could the discovery of Mesmer remain unnoticed? How remain unnoticed, when such as Schelling, Von Humboldt, Ritter, Treviranus, Walther, Hufeland, Eschenmayer, Nasse, Nees of Esenbeck, Francis Bader, Kieser, began to devote their attention to Mesmerism? This discovery, examined by the most impartial, learned, and conscientious men, divested of all

jugglery and secrecy, soon assumed the character of certainty. The most talented physicians found therein one of the most efficacious remedies; the physiologists, one of the most important phenomena in neurology; the philosophers, one of the most remarkable facts explanatory of the most recondite phenomena of spiritual agency; the historian and divine, one of the most striking discoveries, unveiling the wonders and miracles, the dreams and prophecies of all nations.

Public lectures on magnetism were appointed by government in different universities. The Prussian government established an hospital for magnetic treatment, and sent the director of this establishment to Switzerland to obtain from Mesmer all the necessary information. Professor Wolfart went to Frauenfeld to visit the great inventor, who, a few years before his death, had the satisfaction of seeing his works edited by one of the professors of the first university in the world, and his science triumphant in Berlin, Jena, Bonn, Halle, Tubingen, St. Petersburg, Copenhagen, and in several towns of France, Holland, and Sweden. Yes, even in Vienna, where the discovery was made known, where every attempt of reform is doomed to be crushed under the weight of absolute despotism,—even in Vienna, in spite of the laws and lawgivers, animal magnetism has performed, and is performing, the most wonderful cures, under the able treatment of one of the most talented and fashionable physicians, Dr. Malfatti.

And shall England be deprived of the benefit of this discovery,—be deprived, because a false spirit and mind-killing philosophy is exercising its despotic powers to the utter destruction of all scientific and social improvements?

Shall the fear of ridicule, sarcasm, and calumny, deter the lover of truth from speaking his conviction, and from sealing his conviction by acting according to the dictates of the new doctrine? Certainly not; and if all the thunders of a corrupt press, if the wrath of all the congregated professions should conspire against truth, the truth will be manifested, and proved by

THE ALPINE PHILOSOPHER.

THE LAST WORDS OF A SUICIDE.

A FRAGMENT.

"Then farewell to the light of day;
If light can darkness be,
I lived not in the light of life—
Its shades were all for me.

"Adieu, then, night; forgive me, God!
Be there a world to come,
In mercy spare a broken heart,
Revoke the sinner's doom.

"'Tis thine alone to read my wo;
'Tis thine alone to see
The heart that lives not in the world,
But kneels in tears to thee."

He said:—a momentary gleam
Of hope o'erspread his face;
'Twas as the lightning of the storm;
Then darkness filled its place.

FRANK JOHNSON.

THE DOCTRINE OF NONENTITIES AGAIN.

TO THE EDITOR OF THE SHEPHERD.

SIR,—In my letter in your last week's *Shepherd*, I gave you two examples to show how the doctrine of non-entities is attempted to be supported by its promulgators; at the same time I denied that there is any truth in that doctrine. That denial I still adhere to. It is true that, in those examples, I referred to the existence or non-existence of heat and cold, or the properties of matter, rather than to matter itself; but that was of little consequence, inasmuch as the adherents to that doctrine deny the existence of the one as well as the other.

You say that I denied that properties or qualities can exist without matter for them to exist in. Most certainly I did. "This," you say, "is the thing to be proved." Well, as you say that they can exist without matter, or that "matter is a property of mind, and has a secondary existence," it is for you to prove the existence of these properties or qualities, or of mind without matter, and not me. This being the case, I now ask you to prove the existence of the mind of a child independent of the child itself; or before the matter was concentrated of which the child is composed. Prove the existence of the mind of man independent of the man himself, or before he became a man; prove the existence of heat before matter existed; of light before matter existed; of heat and light before the matter existed which composes the sun; of magnetic attraction before the magnet existed; of electricity before matter existed; or any other property or quality before matter existed; or matter or its properties;—prove the existence of any of those properties or qualities before matter existed, or that matter *acquired its existence from them*, and then I shall be satisfied of the priority of these properties and qualities, but, not else.

But let us not lose sight of the question at issue. The doctrine of nonentities denies the existence of matter, and its properties likewise. How then can you pretend that "electricity exists on the outside of a body," and "magnetic power inside, or between the particles," when the existence of the body, both outside and inside, is altogether denied? Really, Sir, there is no species of superstition so degrading to human nature as this. Had the question been started as to which is the *moving power*, matter or mind, or matter or its properties, I should at once have said, its properties; I should have said, that mind moves the man, but that matter first gives existence to the mind; that properties move the various species of matter, but that matter gives existence to the properties, as a candle gives existence to light and heat. But to deny the existence of the very things about which we are arguing, and the insides and outsides of which we endeavour to describe, is the very acmé of folly. W.S.P.

DEAR SHEPHERD,—I have read with no common eagerness, from the first to the last number of your highly-interesting weekly publication, and although I don't admit, or perhaps understand, the whole of your new doctrine, I am delighted with the most of it. Being, therefore, perfectly confident on your impartiality, that I venture to send you this as an answer to your correspondent, W. N., to whom I give credit for having built

a clever and brilliant castle on the shadow of a cloud well adapted to be inhabited by *telluric-living people*.

This whimsical piece of his reminds me of the dog leaving his prey for its shadow, or of Salvator Rosa, who was reproached with making pictures that had very little of the truth of nature in them. "My pictures," said he, "are not like nature, and I am glad of it, for it is nature which ought to be like my pictures."

But what madness is it to refute the insane arguments of the inert-matter-loving visionaries, with an *anti-polar* extravagance not less dangerous and absurd, for the sake, I suppose, of holding the human mind in a kind of *see-saw* agitation!

Would W. N. be so condescending as to answer the following questions put to him by one who never read Berkeley, but has turned over many leaves of the great book of Nature.

1. Is it absurd to think that *mind must have a mode of manifesting itself*?
2. Why should not *real life and matter* be a good manifestation of mind?
3. Since the universal mind manifested itself in the form of a splendid world, why should we consider this manifestation as a deception?
4. Why not consider it as a progressing truth?
5. Should we prefer the rest or relaxation, the echo or reflection of that truth to the truth itself, to get rid of some great difficulties, which I fear we shall meet as well in mind as we do in matter, for that mathematical reason, that the part will never be able to comprehend the whole; and also because mind and matter are not two distinct things, but a consistent whole?
6. Does not the sentient being, or the conscious being, receive his schooling from the outwardly-manifested universal mind?

Who does not perceive, from the smallest atom to the very ingenious mind of man, the law of the *great all*! the real and gradually unveiling manifestation of him who is!!

Inert matter? Pshaw! Who can conceive such a thing? Immaterial idea? who dreamt of such nonsense? *God made a real world, and saw that it was good!* No mistake, and no deception. But as you say, dear *Shepherd*, there is true vision as well as false vision, and dreams are the latter sort; time and space are for ever the regulators of the individual mind; without them, it is a clock without a pendulum, a musical instrument without either time or chord. I could write a volume to prove the error of the dreaming doctrine in the sense of your correspondent, but I dare not trespass any further on your valuable columns. I therefore beg to subscribe myself, dear *Shepherd*, with your permission,

A BARKER OF YOUR FLOCK.

[Of the preceding two letters upon our old subject of mind and matter, we insert as much as relates to the subject. It is evident the writers misapprehend the question; but we give their observations to our readers as a specimen of controversialism, which, more frequently than otherwise, is kept up by undefined terms and reciprocal ignorance in the two parties of each other's meaning. There probably never was a subject more misre-

presented than the doctrine of spiritualism, or mentalism. All parties seem to imagine that it denies the actual existence of stones, trees, hills, and all other objects! They should think before they speak. It denies no such thing. It acknowledges the truth of all past history and present occurrences, and holds all the laws of nature and demonstrations of science in as much estimation as does any other species of philosophy; but it holds this apparent paradox—a paradox only to those who have not studied the subject—that what we call matter is merely a modification of mind, and resolvable into mind. Nor is it without splendid arguments to support it. We know that the two principal attributes of matter are visibility and tangibility, or resistance; and these two properties are purely spiritual or immaterial. Thus resistance is nothing but that mysterious power we call repulsion, a power which fills the whole universe,—which holds the sun, moon, and stars in its hand, and yet is invisible. What is it which prevents you from lifting a huge rock that lies upon the ground, but resistance? a power you cannot see, but you certainly experience it. This power collected into a mass, or condensed, is solidity, or matter, which now only wants visibility to complete it. What is visibility but light? and who will say that light is matter? Thus it appears that the elements of matter are purely immaterial principles, which can be pointed out to the observation of every intelligent mind. As to the question, "Where is magnetism without the magnet?" we reply, magnetism is the magnet, and the magnet is the magnetism. But a philosophy which teaches the priority of matter, by saying that matter makes mind, and then mind moves matter, is the philosophy of *lunacy*. It is the same as bringing something out of nothing—a dead man giving life to a son in order that the son may remove his body. If we want repose for our minds upon this subject, we may find it; but it can only be found in the UNIVERSAL MIND. He who acknowledges this first principle of philosophy has a rational foundation to rest upon. The existence of matter is the next subject, which no man denies. The *mode* of existence only is the subject in dispute. The materialist says it is an infinite collection of dead, unintelligent particles of sand; the spiritualist, that it is the visible and tangible development of an infinite, eternal, omnipresent, thinking, sentient mind. The two may easily be reconciled by the bipolar principle; for the mind is the principle of motion, and matter is the principle of resistance; both are necessary to organisation. It is evident that *A Barker of our Flock* is a spiritualist, and therefore we are surprised at his harshness of language towards those who agree with him.

We shall now settle this matter, for the *Shepherd* at least, and make it so plain that no man with a bump on skull will misunderstand us.

The question may be viewed in two lights, and these two views occasion two distinct modes of expression.

First view represents mind and matter as two distinct entities; in which case we represent matter as inert, and mind as active.

Second view represents both as one; matter a manifestation of mind, and mind a manifestation of matter,—in which case we never speak of the inertness of matter; it is then all life together.

Both views, however, lead to the same conclusion in respect to the moving principle of nature, which is a sentient, intelligent, mental, infinite, and eternal existence.

We can agree with either party. But we mean to drop this subject for a season, as it has occupied too much room.—*Ed.*]

FRENCH CHURCH.

FROM an intelligent French correspondent of the *New York Observer*, we learn the following interesting statistics of the Roman Catholic Church in France. The number of ecclesiastics strictly necessary to serve the churches, chapels, &c., of France, the bishops reckon at 52,000. But instead of this number, there are only 44,447 in actual service, making a deficiency of 12,000 according to official returns. But this is not the most remarkable fact.

"The following figures seem to threaten French Catholicism with approaching ruin.

In 1830 the number of students in theology in the seminaries was 9,304

In 1834, only 7,417

Decrease 1,887

In 1830 the number of students in philosophy, in the preparatory courses, was 3,404

In 1834, only 2,162

Decrease 1,242

In 1830 the number of pupils in the ecclesiastical schools was 19,770

In 1834, only 13,825

Decrease 5,945

"Thus, in four years, there has been a diminution of a fifth part in the number of Catholic students in theology, and of a third part of the pupils preparing for the ecclesiastical calling! What is to become of Catholicism in France? We may judge from the above figures. It is clear that the Romish priesthood declines; that it is deserted by the people, and that young men enter other professions because they prefer them to that of the priesthood. 'This alarming decrease,' says the Catholic journal from which these details are taken, 'may give us the measure of our fears for the future, and make us appreciate at their just value the clamours against the encroachments of the clergy. It appears from the above that the young men have abandoned their calling on account of the reproach attached to the ecclesiastical state, in the unhappy times in which we live.'"

If this decline of the Roman Catholic Church were due to the increase of Protestantism, who would not hail the tidings?—but it is due to the increase of infidelity amongst all ranks—an increase which spreads from town to country with the spread of education. Whether infidelity is to prove the vulture to free the field of France from superstition, and prepare the way for the true faith, or whether it is long to reign there, will depend, under God, in a great measure, on the right settlement of the Church question in Great Britain, and the example Great Britain gives to the world.—*Church and State paper.*

[Is not this enough to demonstrate the necessity of such a doctrine of universalism as ours, to gather the scattered flock of Christ together once more? This same paper, the *Scottish Guardian*, from which we borrowed the above, well observes that the promise of perpetual stability is to the church *universal*, and no security is derivable from it to any *particular* church. Right! it spoke this in ignorance, as the high priest spoke of the death of Christ. But what is a church universal, but a church of *universalism*? That church is now arising, and the gates of hell shall not destroy it, whilst every other shall wither and die.—*Ed.*]

THE "CHURCH," AS BY LAW ESTABLISHED.—A Rev. Gentleman, who distinguished himself as an active partisan of the Tory candidate, in the late election for the Carnarvonshire boroughs, the Rev. J. W. Trevor, Vicar of Carnarvon, a rural Dean, Treasurer of the diocese, and examining Chaplain to the Bishop of Bangor, has, since the publicity given to the ministerial views of Church Reform, been presented by that Right Reverend Father in God to a rectory in Anglesey, worth 900*l.* a-year. Now, the parish is large and populous, and the people understand only Welsh, while the Rev. J. W. Trevor, on the other hand, only understands English; for a month has not passed since he refused the Chairmanship of the Carnarvonshire Quarter Sessions, "because he considered himself incompetent for the office, as he did not understand the Welsh language." The Bishop had a high sense of Mr. Trevor's services for the Tory candidate, and therefore he removes him from a parish in which there is one English congregation to a Welsh parish where there is none. The Welsh church is an admirable specimen of what the Tories consider right and proper. All the bishops are Englishmen who do not understand Welsh. All the collegiate and cathedral establishments are filled up in the same manner. Thus the clergy constitute the whole church, the people being entirely excluded.

[In former days, when the servants of Christ were favoured with the gift of tongues, it often happened, as at present in the case of Irving's disciples, that the gift of interpretation was withheld, so that they did not understand the language they spoke. Now, Mr. Trevor does not say he can't speak Welsh. *He does not understand it; that is, he cannot interpret.* The understanding is not necessary to a parson, as he has all the talk to himself; but at the Quarter Sessions the chairman must listen to others. St. Paul says he would rather speak five words with his understanding, than ten thousand words in an unknown tongue; but you must recollect that, in Trevor's case—there is 900*l.* a-year to be taken into the account.—*Ed.*]

VEGETABLES AND ANIMALS.—Every vegetable has two distinct sets of functionaries or organs, one for individual nourishment, the other for reproduction; that is, one for itself, the other for the species, individual and universal. Every animal has the same; but animals have another system entirely, namely, sensibility and volition, which are also universal and individual; for the first is entirely governed by the universal mind; the latter is the individual mind itself, the creature of the former, the reaction.

SALE OF A PICTURE CALLED "THE STRAW HAT."—This *chef d'œuvre* was sold at Antwerp, in 1822, by public auction. The occasion attracted crowds to Antwerp, and the inns were so full that many persons could scarcely obtain lodgings. The moderns, in this instance, surpassed the enthusiasm of the ancients. Never was such interest known to be before created for a single picture. When it was brought forward by the auctioneer, the bravos and applause were loud and continued. The sale did not proceed for an hour; the biddings then commenced: it was finally knocked down at 3,000*l.* It is now in the possession of Sir Robert Peel.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admission Threepence; Ladies Free.

CORRESPONDENTS.

A. D.'s theory of the eternity of the world we have read carefully, but we really think him very credulous and partial. Rather than believe Moses, he will believe any thing. The ten avatars of the Indians are ten great periods of 25,000 years, with which he makes out a grand cycle of two millions and a quarter; for which immense period he quotes the authority of the Indian cycles! as if these were more rational than Moses himself. Let him read Bailly's *Ancient Astronomy*, or Professor Playfair upon the subject, and he will find that the Indian astronomy is but a modern thing after all. Bailly demonstrates that it cannot be more than 5,000 years old; and, if we mistake not, Playfair himself, an infidel, reduces it to 4,000. Berossus, whom A. D. has quoted as authority, also says that there were 432,000 years before the flood; and yet he informs us that Xisuthrus, or Noah, was the tenth in descent from the first man—of course, according to Berossus, men would live at least 43,200 years at that time. Nothing can be more certain, as Bailly says, than that some of these years were merely fractions of hours, minutes, or seconds; and he has, upon this principle, reconciled the different chronologies of the Chaldeans, Chinese, Indians, and Hebrews, to within little more than a hundred years of each other. We have already treated this subject in a former number of the Shepherd, where we stated the case between the two parties as fairly as we believe it ever was stated; there is much truth on both sides. The literal history of creation, as given by Moses, cannot be received; it is not historical, neither is it traditional; it is revelation, or allegory, for revelation is always allegory, and every man is at liberty to use it as he may. It will serve all ages, both the ignorant and enlightened. But there is no occasion, in an age of criticism, for leaping from allegory into fable, and eternal, infinite chaos. The Mosaic chronology of the human race has never yet been shaken; no records of time are older than 5,000 years, and there is not the slightest grounds for supposing that the human race on this planet is older than 6,000. The work of animal creation was going on thousands of years before that, but man was not in being. He is just about to enter into his Sabbath, according to the united testimony of nearly all nations. Were A. D. to give us data, or positive evidence upon the subject, we should willingly insert it; but presumption and conjecture on such a remote question are by no means instructive, and his view of the matter is far from being conciliatory. It stamps the fables of others with the seal of truth, for the purpose of refuting Moses.

The articles of I. S. are excellent, but yet there are some few exceptions, which betray very narrow, though very common, views of nature. Thus the fifth article, "that all supernatural instruction involves partiality, and is inconsistent with an independent being, who must of necessity be just," is ridiculous. In the first place, revelation is not supernatural; and in the second place, it is not more unjust than giving knowledge, memory, talent, beauty to one, and withholding them from another. It is perfectly consistent with nature and justice.

[Price 1d.]

SYSTEM OF NATURE.

Our articles on the Doctrine of the Woman must be regarded as part of the System of Nature, for we shall proceed in our leading articles upon the reasoning employed in the other, a knowledge of which is indispensably necessary for systematizing the progress of Nature.

Woman is the first and the last, the beginning and the end of Nature. The birth of Christ is a beautiful emblem of our common descent from the virgin mother of all, the womb of all finite being, the source from which we derived life and organization, and from whose body we first sucked the nourishment which gave growth and vigour to our constitution. The story of Christ is the story of Nature and her offspring; but her first offspring is man, and her second is woman: woman is first as a mother, last as a daughter.

These three ideas, mother, son, daughter, are an epitome of the history of the Progress of Society: the son and daughter become the father and mother of the new creation—the second birth—the fulness of time—and the inheritance of all things. It is for this reason that the son is always represented as the creator; and for this reason Jesus Christ, the representative of the Jewish church, is called the creating word.

The external-world matter is the mother of all thought; all our ideas are derived from it; by it our minds are instructed and fashioned, and a rude, disorganized chaos it is to our ignorance and inexperience at first. Hence we see materialism, polytheism, idolatry, worship of Nature in detached fragments, without any idea of unity or connection prevailing in the early history of nations.

In the second place, arose the spiritual doctrine of unity, the god of the revelation of progress, the god of Judaism, Christianity, and universalism, without an image or likeness.

In the third place, arose materialism again, God manifest in the flesh, seen, heard, handled, spirit and matter united, Christianity.

These are the three stages; but all imperfect, being in the world of evil or individualism. Hence, in the first stage, the gods were partial and local; one place, one grove, one piece of stone, wood, or metal, was more holy than another; some places were accounted profane, others so immaculate that the ground must be trod without shoes on the feet, and with a peace-offering in the hand. This is the character of the whole of the first three, which are merely the trinity in succession. The Jewish god was an exclusive also; he seems as if he had a spite against all Nature, but himself and his angels; his ark

is so sacred that he smote with instant death an unwary Jew, who put his hand upon it to prevent it from upsetting; and his holy of holies, so very pure, that none but the high priest can enter, and he only once a-year, after having performed ablutions and purifications, both of water and blood. The Christian God is also an exclusive; his body and blood are better than any other flesh and blood in the world, all other being corrupt, sinful, and depraved, but itself alone; whilst all Nature lies under the Father's wrath, but what is attached by faith or clerical appropriation to this all-favoured body alone.

These three great stages each contain an important truth, corrupted only by the narrowness of its application. The spirituality of God is a truth; the materiality or incarnation of God is a truth; but the locality, finity, and partiality of that God is the *Devil*.

The progress is somewhat similar respecting futurity. The old polytheists and idolators had a confused idea of a Hades, or place of departed spirits; that man continued to live after death as a ghost or phantom; and infinitely various were the conjectures they formed, according to the particular deity, grove, or stone which they worshipped. Thus, their materialism of worship led directly to pure spiritualism respecting futurity. The Jews, on the contrary, worshipping a spiritual god, were led to materialism, as the source of felicity in the world to come; their hopes were in this material world alone, first in the promised land, as the reward of obedience; and then, in the resurrection, under the Messiah, with good solid bodies, and solid material to support them. Moses never spoke of a future state; but it is evident, from the prophets, that the doctrine was always received as a matter of course. Thus the Jews merely reversed the order of polytheism, and caused the two polar extremes of mind and matter to change places. Then the Christian, with his material god, spiritualizes every thing: by acknowledging the spiritual god of the Jews, however, he receives a portion of the materialism which is attached to a spiritual deity, namely, the resurrection of the body; but the body is only raised to be removed somewhere else, for, according to him, this material world is to be destroyed, and the resurrected bodies to be taken God knows where. In every other respect, the material God has got the advantage; and such is the chemical affinity of matter to mind, and mind to matter, that the incarnate-material Messiah has spiritualized all the enjoyments of life, and taught his followers, whilst they teach theirs (though they do not practise the precept) not to place their affections on things below (matter), but on things above (spirit), where Christ sitteth at the right hand of God.

Thus, it curiously happens, that, in all these stages, mind and matter have been allied in a most scientific manner, according to the laws of chemical action; but yet so as to bring forth an exclusive and partial doctrine. Universalism embraces and amalgamates them all; they are the three steps towards universalism, types of the final truth of the religion which shall cover the earth like the dew-drops from heaven.

This explains the source of some apparent differences in our modern analysts respecting the sexual character of matter and mind. The St. Simonians gave the name of male to the mind, or spirit; Southcottianism represents the woman as a type of the spirit. Both are right, but the views of the subject are different, thus:

| MALE. | FEMALE. |
|-------------------------|-------------------------|
| Jewish spiritual God | Jewism materialism |
| Christian spiritualism. | Christian material God. |

But this is not a final analysis, for the male must be regarded as the agent, the female as the object; therefore, God is male in both, and the object female in both, so that they may be arranged thus:

| MALE. | FEMALE. |
|--------------------------|---------------|
| Spiritual God (Jew) | Materialism |
| Material God (Christian) | Spiritualism. |

Merely a reversion of the poles makes the two churches; but still these two are one and the same system, for even in the material god the spirit is the moving or male principle; and what is refined materialism, but spiritualism? and what is gross spiritualism, but materialism? Hence Jewism ended in spiritualism, Platonism, and Essenism at last, and Christianity is closing in materialism!!—a beautiful specimen of chemical affinity and the bipolar law of universal Nature.

Thus it matters not which view you take of the subject; you come to the same conclusion. Nature is a mystery. You may just as well turn round your face for ever, in order to get a look at the back of your head, as attempt to discover the beginning or the end of any thing. There is no beginning, no end; all is involved in an everlasting circle of cause and effect. But there are certain conspicuous states or stages, which in common parlance are called beginnings. We call birth the beginning of life; but we were alive before we were born, or we would have been born dead. We call Jesus Christ the beginning of Christianity; but all its features were in the world before, but not so compactly put together and systematically arranged. We call Copernicus the beginning of the Copernican system; but Pythagoras taught it two thousand years before the time of Copernicus. So also we call Jewism the beginning, or first-born of revelation, although revelations were made thousands of years before its being; but it was the first national organic birth which Nature had destined to grow and overspread the earth. We call it therefore the male; the Christian church, which came out of its side, is the female. Hence the one is represented by a man, the other by a woman. Nothing can be more simple and evident than this. The multiplication table is not more demonstrative.

But the two elements must always be discovered in every system according to the universal law of action and reaction. Though therefore the Christian church,

as compared with the Jew, is female—a mother church; yet, when analysed by itself, we find the two sexes in its own nature—the spiritual and material churches. The Catholic church is a church dominant—a male, having sovereign authority, holding the sceptre with all the attributes and prerogatives of the male. The Protestant church is a dissentient from this principle, subjecting itself to the magistrate, and condescending to act the part of a wife, instead of a husband, to the state. It is evident then that the Catholic church, as compared to the Protestant, is as male to female. The Protestant church, then, represents the bride, and Britannia represents the Protestant church.

It is an easy thing to trace the bride, from creation downwards to the Protestant Church, and the English Church in particular, as the national or imperial church, subject like a dutiful wife to the political power, and also first established by a woman (*Elizabeth*). You may also trace her, if you have a mind, to the west of England, as being the extreme end of the line of progress, from east to west. In fact, there is no end to the system of Nature; but it requires a very strong mind to go far into the details; nor is it necessary, for conviction, to go into particulars. All we aim at is to give a good general outline or map of the plan in general, and throw open to the public mind the splendid science of "Progress," hitherto an entire secret.

In this line of progress we see nothing but a continued succession of systems, rising and falling one after the other. The Jewish church gone; the Greek church gone; the Roman church sadly disorganized and stripped of her purple, there being not a single Catholic church in Europe, which has not been of late years dispossessed of its power and property, and humbled almost to annihilation. The Church of Italy, once the pride of the world, is not now worth a million per annum. Spain, at one time quite impotent with clerical and ecclesiastical fat, has already laid violent hands on the property of the church, and reduced the tithes one-half. At one time its three thousand monasteries were worth 186 millions, exclusive of tithes: the greater proportion of this was appropriated by the state. The Church of France cost at one time as much as our own; now it costs only one million, whilst the supply is equal to the demand. The Emperor Joseph the Second, long ago placed all seats on an equality, and ordained that no man should pay for a religion to which he did not belong. In fine, ever all the continent the church has been revolutionized. England alone has preserved her ecclesiastical establishment uninjured—but can it continue so? No; she is the last, because she is the most western; but her time is at hand, and she also will witness an overthrow of her ecclesiastical structure. They must all die; they are the offspring of sin; the devouring whelps, that are generated in ignorance, and live upon the vitals of society; the system of Antichrist or first Christianity.

Then what shall we say to the promise of Christ, "Thou art Peter, and upon this rock I will build my church, and the gates of hell shall not prevail against it?" A true prophecy; Peter first preached Christianity to both Jews and Gentiles, and Christianity is eternal as

human nature itself. It will undergo a wonderful transformation; but all they that aim at its annihilation shall perish, and their doctrine along with them. What religion on earth has ever perished? Have the sacrifices of the polytheistical materialists? No; they were embraced by Jewism, humanized by Christianity, and will be spiritualized by universalism. Has the demon worship of the pagans been destroyed? No; it was metamorphosed into the Catholic worship of the saints, and their images, and is now practised by sectarians of every grade; who not only adore the different leaders and teachers which they themselves approve of, but hang up their pictures on their walls, and carry their likenesses upon bracelets and brooches, medals and snuff-boxes. This also will be embraced by universalism, which acknowledges the divinity of all the human race. "Behold what manner of love the father hath bestowed upon us, that we should be called the sons of God," (1 John iii. 1,) "and be made partakers of the divine nature," (2 Pet. i. 4). Nothing is lost; it is merely refined or transformed; beginning in a rude and uncouthly shape, it follows the progress of the human mind, and ultimately comes out, like a jewel from the hands of the workman, quite different in shape and aspect, but the same in substance. They do not know nature who try to lay a new foundation, or work with any other than the old materials. They are mere alchemists, searching after a philosopher's stone and a universal solvent, instead of applying their skill and their energy to the useful application of what Nature has already provided for them.

But how will this promise apply to Christianity in a particular manner? Because it will nominally embrace all others, whilst all others shall nominally fail. It is contrived in such a manner as to become universal; it has a systematic and progressive organization, and is capable of assuming a form as liberal and enlightened as it has hitherto been intolerant and ignorant; therefore, as the liberality and intelligence of the age progress, they will force Christianity to cast off the old man, and put on the new man. It will rather do this than perish, and men will gladly receive it thus transformed, and thus keep unbroken the golden link of human training. It cannot be otherwise. We now defy infidelity. It is morally impossible it can succeed, for the Christian world will much rather receive our doctrine than atheism and annihilation, chaos and everlasting gloom; and moreover our universalism is much better supported, both by liberality, charity, and general science. Infidelity, however, is an admirable pioneer for breaking up the old church, and alarming the self-righteous saints.

The old churches are not progressive churches. The reigning powers were obliged to stagnate them by creeds, in order to preserve something like order. Men would have run wild with conjecture, and thoroughly disorganised society, without some check. Whilst the pope was in his glory, the check was in his authority, and then the church was progressive; but that progress being guided by ignorance, led to mischief, dissatisfaction, and revolution. Then the Council of Trent stagnated the papacy by the twenty-five articles; the English and Scotch churches have done the same; and the

dissenters have all and each articles of their own; but now when knowledge and education are spreading, the spirit of the age demands a progressive principle. If the church won't concede this voluntarily, it will suffer political death. Infidelity and dissent will crush the Establishment, or unprogressive church. Then the next query will be, whether men shall continue by the old articles of obsolete faith, fitted only for barbarians and an age of superstitions, or adopt the other extreme—the chaotic system of utter rejection;—or the new system of universalism and progress. The latter will be adopted by every sensible man, and before this generation has disappeared, it shall have established itself in the hearts of the greatest proportion of the civilized inhabitants of the earth.

THE SHEPHERD.

WONDERS OF THE BRAIN AND NERVOUS SYSTEM.

In the Third Report of the British Association for the Advancement of Science, published last year, is inserted an abstract of a very interesting paper, by Dr. Macartney, Professor of Anatomy and Surgery in the Dublin University, entitled "Observations on the Structure and functions of the Nervous System." It appears that the learned doctor, by employing a peculiar method of dissecting the brain, has been enabled to discover that all our former ideas with respect to the structure of the cerebral organ, fall far short of the intricacy with which its several parts are combined. He observes, that all the white substance, whether appearing in the form of bands, cords, or filaments, or simply pulp, are composed of still finer fibres, which have a plexiform arrangement; and that all those fibres, to the finest that can be seen, are sustained and clothed by a most delicate membrane. By the same mode of dissection, also, it is possible to make apparent the existence of still finer interwoven white fibres in all the coloured substances of the brain, in many of which the nervous filaments are so delicate and transparent that they are not visible until in some degree coagulated by a solution of alum, or by spirits. Dr. Macartney has thus been enabled to see twenty-six plexuses not hitherto described in the brain, the fibres composing which assume two arrangements, the one reticular, the other arborescent. Following up his researches, the author is led to conclude that the actual quantity of the sentient substance existing in the brain and other parts of the nervous system is extremely small. The bulk of these parts is not materially diminished by removing their nervous matter, provided their membranous structure be left behind; and whenever the sentient substance is connected with a highly attenuated membrane, as in the retina, and in several of the cerebral plexuses of the brain, it is absolutely invisible, until it has undergone some coagulating process. From these data he opines that the whole nervous system, if sufficiently expanded, and divested of all coverings, would be found too tender to give any resistance to the touch, too transparent to be seen, and probably would entirely escape the cognizance of all our senses. Consistently with this view of the matter, the author thinks that we can hardly take upon us to say that the simplest ani-

mals, and even plants, may not have some modification of sentient substance incorporated in their structure, instead of being collected, as in the higher classes of animals, into palpable membranous cords and filaments. He also considers that the sentient substance is in no place distant or isolated; that it is essentially one and indivisible; and that consequently the nervous system differs from all other systematic arrangements in nature. And this theory of the sentient system will alone serve to explain the numerous sympathies which exist in animal bodies, the occurrence of disease in the higher orders of animals, from indirect or remote impression, and the operation of all remedies which act through the medium of the sensibility.

The author concludes by stating his belief that every assemblage of the nervous filaments in the form of plexus is destined to fulfil an especial purpose; and anticipates that, at no distant time, we shall be able to understand many of the phenomena of sensation which have been hitherto veiled in the utmost obscurity.

From the same volume of the Transactions of the Association we copy the following proposition from Dr. Henry's Report on the Physiology of the Nervous System, as illustrative of the uncertainty which still hangs over the phrenological science.

"That the brain is the material organ of all intellectual states and operations, is proved by observation on comparative development, as well as by experiments on living animals, and by the study of human pathology. *But there does not exist any conclusive evidence for referring separate faculties or moral affections to distinct portions of brain.*"

[The above hypothesis respecting the nerves reminds us of the doctrine of Swedenborg, that the soul has the same shape as the body; for, according to this theory, the infinitely subtle nervous substance diffused over all the body must, when separated from the rude mass, be merely the soul of the Swedenborgians.—ED.]

FRAGMENTS.

It is midnight: the stillness of death surrounds me. No sound is to be heard, except the distant murmuring of the sea, that breaks its billows against the rocky shore. A lamp spreads a pale glimmering light over my writing-desk, and the books which cover it. I am alone, and I am, as it were, for the first time, before a Judge, on the verdict of whom my whole happiness depends. Eternal Judge! here I stand, lonely in the infinite night!

I am. Am I sure that I am? Or is this consciousness of my being but a dream? I think, I will, I act, I love; who can convince me that all this is but delusion?

I am, because thou art, and because I have a consciousness of my being. I have faith in thee. Dost not thou reveal thyself within my own self; and as my spirit creates thoughts, as my thoughts create words, does not thy Spirit create me, my thoughts, the objects of my thoughts, and all?

Thou art the Spirit, and the matter is thy word, and the law that governs thee, all are thy thoughts. Eternal Spirit! thy laws, thy creations, are eternal!

When a boy, I watched the little seeds of the silk-worm; as soon as thy spring had called forth the buds of the mulberry the eggs became alive, and the young caterpillars were immediately fed with the tender leaves of the mulberry; and both the leaves of the tree, and the caterpillars grew in proportion. At length the caterpillars began to spin, and within a few days they had concealed themselves in golden cases. But after a little while I observed a darkish spot at the tops of the golden eggs, and, after a little while, winged, white butterflies flew abroad, both male and female. And the male and female had but a short life. Yet their life was not useless; they died after having deposited on the neighbouring wall numerous seeds of future generations. Their relics were soon decomposed in organic matter, and the Spirit of life called them to new combinations.

And shall my being, my thinking, willing, acting being, be perishable, because the casement in which it dwells withers and is decomposed? Eternal Spirit! my spirit is imperishable like thine.

There is a class of men who continually mistake the causes for their effects. Because they see that the Spirit reveals itself in the same proportion that the organic instrument becomes more perfect, and *vice versa*, they judge that the instrument and the spirit are one and the same. The short-sighted ones! The Spirit creates its instruments; its plastic principle forms the organs, in the same way that the silk-worm spins its cone and transforms itself into a butterfly.

And why should our human organization be the last step of the production of the Spirit? Why should there not be other forms possible still more perfect, though invisible to our present senses? Why should it be impossible to wander from planet to planet, from star to star, with continually progressive forms? I see nothing impossible in this. And if so, is the apparition of ghosts so absurd? I verily believe that there are other forms of existence than those which we know, and I do not doubt that this very moment I am living among a host of spirits.

The morning dawns—the east is covered with rosy flowers. Spirits of the night, farewell! May the next midnight hover again friendly around

THE ALPINE PHILOSOPHER.

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER VIII.

Deus mundo immersus, mundo emergitur semper.
God, immersed in nature, emerges continually from nature.

WHOEVER wishes to penetrate the inmost recesses of nature, must purify himself, by laying aside all envious thoughts, all prejudices, and that towering pride, which paralyzes, as it were, the nerve of the spiritual eye. God has placed nature amidst the broad daylight, as a

mysterious sphynx; she speaks, and her words are the words of God; but these words are hieroglyphs for the profane. In the same way as the illiterate Indian would gaze at a printed book, unable to decipher the combinations of its letters, so the profane stands before the living letters of the Lord: "He has eyes, and cannot see; he has ears, and cannot understand." But the ever kind mother has pity upon the weakness of her children; from time to time she lifts up her veil, and the eternal life of God reveals itself in flaming letters.

When this occurs, many facts that were assumed to be true appear as errors, many systems founded upon these assumed facts sink into nothingness, and facts that were denied, because they would not agree with favourite systems, are again called back as evidence of systems, to which the revelations of nature impart an undeniable truth. But the mock philosophers, and the mock divines, to whom every new revelation is a death-blow, because they live upon the ignorance of their followers, as soon as a new beam of heavenly light irradiates the world, both unite together, to smother, if possible, the revelation of nature.

Tellurism, or Animal Magnetism, is such a light. Is it to be wondered at, if this discovery has hitherto met with powerful opposition, so powerful as to have prevented its yet being spread in this country?

Besides the difficulty which every revelation of nature has to meet with, Animal Magnetism has many peculiar disadvantages to contend with. The artificial mode of living counteracts in a certain degree the natural action and reaction of the elementary powers of nature. We are awake when the telluric influence calls us to sleep; when the solar power would awake us, we consume the best hours in unrefreshing sleep. Our digestion impaired by unnatural living (too high or too low); our vital powers paralyzed by poisoning passions, toils, cares, vices; the air which we breathe impregnated with impurities; even the fluid which nature prepares so carefully mixed with putrefaction; our nervous fluid, our blood, corrupted even in the womb of our mothers, by oxides and protoxides of metals, and by drastic medicines:—all these circumstances often make the patients, for a long time, restive to the influence of tellurism.

Moreover, such is the power of fashion, that men bred in colleges are afraid to lose their dignity by performing a magical operation, like that of magnetism. And if that was not the case, their interest would not allow them to attend to this mode of treatment.

The somnambulist requires often the whole attention of the physician during hours; and that for several weeks—yea, months! And in certain cases the somnambulists have the impertinence to discover the mistakes of the doctors, and the insolence to prescribe for themselves, without paying the least attention to the sayings and doings of the learned faculty!

Dr. Wienhold, in Bremen, once treated magnetically Miss R., a young lady highly gifted, but entirely unacquainted with medicine. On one occasion this lady prescribed, during somnambulism, the decoction of certain herbs, which she described most accurately, without knowing their botanical names. The herbs prescribed

were not only unknown to the medical world, as possessing any antispasmodic or nervine properties, but unknown also as officinal to all compounders of domestic medicines. Still the young lady persisted in demanding the decoction. The doctor, looking at his Floras, thought that these herbs could not be found at that season of the year. Upon his making this observation, the somnambulist pointed out the very spot, about a mile and a half from town, where they would be found. The doctor, in company with *Olbers*, the great astronomer, went to the place designated, and to his great astonishment, found the herbs. He collected them, and brought them, together with other herbs, bound in bundles, and presented them to the patient whilst in magnetic sleep; Miss R. chose among the different bundles those which contained the herbs that she had required for the decoction.

The same lady, upon another occasion, prescribed for herself a mixture. The doctor fancied that the dose of crocus was too large; he went to the chemist, and ordered the mixture according to the rules of art, diminishing the dose. The mixture was given to the patient while awake; she took it without knowing that she had prescribed it, and totally ignorant of its contents. The next day, when she had fallen into magnetic sleep, she reproached the doctor for his having acted in contradiction to her prescription, and insisted upon his obeying her orders. The doctor then had the mixture made up as prescribed by the somnambulist, which, instead of injuring the patient, acted most beneficially.

These are facts, the evidence of which no one can deny. But how few of the members of the collegiate wisdom would submit themselves to have their doctrine put to the test of a *clairvoyante*!

The medical art is generally exercised as a profession; the income of the medical man depends on the amount of his business. The nervous diseases, and all the various evils which depend on those numerous complicated disorders of the vegetative system, hysterics, hypochondriacism, catalepsy, epilepsy, nervous lameness, paralysis, and all that is comprehended under the name of female complaints, offer the richest harvest to the doctor, practitioner, and chemist.

It is certain that the medical art knows nothing about these complaints. The greatest men of all ages have confessed their ignorance about these important topics. Hahneman, the author of the Homeopathic System, and his followers, have proved that the usual mode of treatment in those diseases, instead of being beneficial, is highly mischievous.

To convince our readers of the ignorance of the physician in the cure of these complaints, we need only point out that each doctor treats them in a different way; indeed, that each doctor avowedly changes the treatment of these disorders in the same individual, without any other reason but the failure of his experiments. Open the books of the physicians of all countries, observe their prescriptions, and you will find that all that the three can produce have been alternately tried to subdue these complaints.

Whilst the pupils of Hamilton and Abernethy, ima-

gining that all these diseases depend on a disorder of the stomach, lavish the cathartics to their patients; the pupils of Brown and Roeschlaub, alternatively with these, have recourse to stimulants or contra-stimulants; the disciples of Marcus, Tommasini, Rasori, and Broussais, on the contrary, attack the same diseases with more or less sanguinary means, some covering the sufferers with leeches, others bleeding them almost to death. The empirics have extolled, by turns, the efficacy of opium, belladonna, camphor, valerian, Peruvian bark, stramonium, and veratrum; others recommend crocus, serpentaria, angustura, angelica; whilst others reckon among their favourite remedies, moschus, castoreum, oleum cajeputi, oleum animale dippel, &c. Some praise the alkalis; others, the acids. The Jatro chemists, who think of finding the safest remedies in the metallic and elementary combinations, have been prodigal with oxides and protoxides, sulphates and bisulphates, carbons, and carburets of mercury, lead, zinc, bismuth, copper, iron, barytes, and arsenic; blisters, electricity, galvanism, baths, artificial issues, moxa, and hot iron. Indeed, we know of a renowned professor and physician, who almost every year had submitted his patients to a wholesale treatment of some of these remedies. We know that he for a whole year had mercuried them; the next year they were ironed; afterwards zinced; then silvered. After a while the antiphlogistic (sanguinary) system became his favourite one; and now the salts and sulphates of the narcotics, strychnia, veratrina, and such like, are the enchanted arms by which he assails diseases.

It is evident that this contradiction among the learned, these experiments among the quacks, show plainly to every one, whose organs of perception and judgment are not impaired, that the nervous diseases, and all the complicated disorders of the vegetative system, are a god-send for those who, in playing at blind-man's-buff with nature, reap a large harvest from the pockets of the credulous and ignorant. Their modes of treatment, instead of removing, complicate the diseases more and more. The use of drastics injures the powers of digestion; the use of narcotics paralyses the nerves; the antiphlogistic method destroys the vital power of reproduction; and all the mineral preparations, supposing they succeed in removing for a while the most tormenting symptoms of the disease, do not remove the cause of the disease, which, Proteus-like, breaks forth in new forms and shapes.

How many, even of the wealthiest of society, are thus continually afflicted, exchanging disorder for disorder! How many are deprived, in their most blooming age, of the greatest gift of nature, a sound body! How many mental disorders originate and are rendered incurable by the improper use of those remedies, which the learned lavish upon their patients only for the sake of concealing their own ignorance, or for gaining pelf, by practising upon the credulity of others!

Now for those diseases for which the medical art has no compass to steer by; for the nervous diseases under all forms, as well as for the diseases of the vegetative system, and particularly for female complaints, Tellurism, or Animal Magnetism, is a specific remedy. Such diseases are convulsions, fits, hysterics, epilepsy, catalepsy,

affections of the eyes and ears, general and partial nervous lameness, all sorts of congestions and hæmorrhages, disorders of menstruations, disorders of digestion, nervous headaches, tic-douloureux, incipient dropsy, all incipient cutaneous diseases, pains in the limbs, scrofula, nervous debility, and nervous decline; all these disorders, if the vital power has not been destroyed by the abuse of medicines, can be cured radically by Tellurism.

In these disorders, when the vital power has not been too much impaired, the cure is operated by Animal Magnetism alone, without the aid of any other remedy. If these disorders are treated by Magnetism in their beginning, their cure is almost miraculous, the patient recovering his health without scarcely feeling the effects of the treatment.

If the disorder be of long standing, and complicated, the cure is effected by somnambulism, and often by remedies prescribed by the patient during the magnetic sleep.

We shall now give some accounts of cures performed by magnetism. We extract the following account from the Acts of the Philosophical Society of Berlin, of the 13th of December, 1811.

Dr. Metzdorf, in Berlin, a physician, was called to a lady eighteen years of age, who was labouring under a severe illness. She complained of continual pains in the head, fits, want of appetite; she suffered from oppression in her chest, and want of respiration; her skin was dry and hot. These symptoms were aggravated by want of rest, and a melancholy bordering on insanity. The menstruation was regular; the pulse hard and feverish; her bowels constipated. After having tried cathartics and bitters, tonics and balsamics; after having endeavoured by all means to promote perspiration; in short, after having acted according to all the rules prescribed by the schools, the doctor at last, in despair, resolved to try the power of Animal Magnetism. He had never tried it before, and had but little faith in its efficacy. The young lady was altogether an unbeliever.

The trial began the 29th of October, at twelve o'clock in the morning, in the presence of the mother and the sisters of the patient. After five minutes' manipulation, she found the pains diminishing; she felt heaviness in her eyes. The operation lasted ten minutes. After the departure of the doctor, she laid herself on the sofa, and slept an hour. She awoke with less pains than usual. During the night she had for the first time good rest since her illness. The next day the manipulation lasted for ten minutes, after which she fell asleep, and slept for two hours. The pains decreased, and she passed a good night.

On the third day, after having been manipulated at the usual hour for about ten minutes, she fell asleep, and slept four hours. She awoke with but little headache, and with good appetite; her bowels had become regular.

The first of November the same favourable results from the manipulation, with the addition of a gentle perspiration.

The doctor was prevented for two days running from attending his patient; the consequences were, convulsions, melancholy, dreadful headache, loss of appetite, and costiveness.

The fifth of November, at seven o'clock in the evening, the treatment was resumed. She complained of heaviness in the arms during the manipulation. Excellent night's rest.

On the sixth the headache had diminished. The treatment was continued as before. After five minutes' manipulation, she fell asleep, and slept one hour and a half, which was followed by abundant perspiration. Her appetite was restored, and costiveness removed.

Under the same treatment she continued to improve. On the eighth she was not magnetised, and slept very little, and was restless.

The ninth she awoke very weak, but got better after the magnetical operation.

The tenth the treatment was painful to the patient. She felt a contraction in the whole body; she was unable to move a single limb, or even to speak; her facial muscles were convulsed. The treatment was continued longer than usual, and all these symptoms disappeared. After the manipulation she fell asleep, and awoke in the possession of her full health. No trace of convulsions, or of headache, remained. Her melancholy had disappeared. The young lady left that very evening her sick chamber, visited some friends, and enjoyed with liveliness an impromptu dancing party given to celebrate her recovery.

The perfect cure of a disease was completed which had baffled the skill of the medical art.

Here the cure was effected by the direct influence of the magnetic treatment. This alone brought into harmony the discordant strings of her afflicted frame, by restoring digestion, perspiration, and rest; and thus removing constipation, fits, and melancholy.

Had Dr. Metzdorf, like some of the old school, continued to attack the disease by drugs and minerals, most probably the young lady would now have increased the number of the unhappy beings who are condemned to be immured in public or private mad-houses.

In a similar way, many of the most eminent physicians in Berlin, Bremen, Dresden, Stuttgart, and Bamberg—such as Hufeland, Weinhold, Kieser, Nasse, Fischer, Nordhof, Schelling, Brandis, Marcus, and Gmelin, have cured nervous and other complicated complaints, without producing any other visible effect than the cure itself.

And is it not the same with the formation of the diseases? Do they not arise insensibly to the stage which announces to us their existence? This way of a quite insensibly acting medium, is it not in harmony with the whole system of nature?

To the witness of those men, I can boldly add my own experience. I have healed many nervous and complicated female complaints, without carrying the treatment so far as to produce somnambulism. Indeed, I think it very wrong to bring forth this phenomenon by main force. Yet, when it develops itself as it were voluntarily, then we may be sure that its results will be beneficial to the patient, and impart instruction to the philosopher.

In the next letter I shall give a most curious history of a magnetical cure performed by myself upon a lady in Chur, in Switzerland, who, in the thirty-second year of her age, and in the third month of pregnancy, was confined to bed with a flux, declining fever, fits, and swoons, and want of rest and appetite. She was perfectly cured, after having passed through the highest degrees of somnambulism.

To-day, I take leave of you, my dear Shepherd, and beg you to let your readers know, that if any of them feel inclined to try this power, they may address themselves to

THE ALPINE PHILOSOPHER.

THE DOCTRINE OF THE "WOMAN."

NO. III.

WE shall now examine the writings of Joanna, and see whether they contain our elementary doctrine of the single origin of good and evil. We have already demonstrated from Nature and the Bible that the two principles or spirits, called God and Devil, are one omnipresent mind acting in two polar characters. Do Joanna's writings teach this doctrine? We say they do; but of course they teach it in such a way as to conceal it, and teach the contrary at the same time. It would not be a mystery if they did not. The Spirit speaks pretty smartly against the Devil at times, although it is never in such a passion as she herself was; and the Devil, when he argued with her, was as jocular and fanny as any devil could be, and so condescending as always to give her the last word; telling her at the same time that he was her maker, and that his kingdom was eternal.

But to the proof: Richard Brothers having published a book in which he described God as a deceiver, (one who had falsified his word, and amused his prophets with ambiguous and delusive promises,) and maintained that the Devil who deceived Eve was nothing but God himself speaking through the mouth of the serpent; Joanna was shocked at this blasphemy, and laid it before the Lord to enquire of him; the answer was, "*As the light is too strong for thy eyes, so is the truth too strong for thy senses.*" This was somewhat astounding to the old lady, but as it was not fitting she should know this splendid truth, which required to be introduced in a very different manner, and by a different sex, the spirit begins to wheedle her out of it again, by representing Richard as a very naughty boy indeed, but calling him his servant after all, and showing no displeasure whatsoever. Richard was right, and the anger of the bride was merely the silly excitement of ignorance and false piety. Joanna imagined that the words of the Lord's prayer "*lead us not into temptation,*" had been altered by men, and should be read "*leave us not to temptation;*" the spirit answered "no man hath changed them."

The spirit was wont to allegorize many of the incidents in her life, and deduce moral and doctrinal conclusions from them; amongst others, the circumstance of her courtship with Noah Bishop, her sweetheart, in her eighteenth year. Noah and she used to meet together after dusk, like many others under similar impulses; but one dark night they missed each other at the place of rendezvous, though both had kept the appointment; upon which the spirit gives the following remarks:

For Satan there did strong appear,
To make you miss the mark,
As I your footsteps did prepare,
To leave both in the dark;
Because the thing I did design,
To bring the shadow here,
To show the substance to mankind,
The way I shall appear.

S. E. F.

From these words it is evident that Satan and God are one and the same agent, the bipolar or twofold principle of Nature.

Upon the subject of evil, human ignorance, &c., the Spirit speaks very sensibly in the following lines, in which he ascribes all ignorance and error to himself as the original and only source:

I caused my servants to err,
For ends they did not know;
That every truth may be more clear
To all mankind to show.

The wisdom of the prudent man

'Twas I alone conceal'd, [prince of darkness]

That they might see with eyes more bright,

When I the truth reveal'd. 1st B. W. p. 80.

In the following lines the language is somewhat different; the evil is represented as being permitted, not caused; but it is evil of such a nature as to throw some disparagement on her own writings, and her own personal qualifications for a teacher:

*The arts of Satan oft have fill'd thy brain,
Which in thy writings I let to appear
To tell thee lies, and fill thy breast with fear.
Then I appear'd in wonders that were true,
And all these mysteries laid before thy view;
Which caus'd a burden on thy mind and soul;
Thou judg'd'st it one spirit that did tell thee all.*

S. E. F.

Of these lies of Satan also, and what some call his lies in the Bible, the Spirit says, "I will make all Satan's lies true in the end."

This double way of talking is quite in character; we find it very remarkably employed in the writings of Moses. Thus the Lord says to Moses (Exod. xxxiii. 2, 3), "I will send an angel before thee, and drive out the Canaanite, &c.; for I will not go up in the midst of thee, for thou art a stiff-necked people;" and yet the Lord was talking to Moses all the way, face to face. The prophets call this Lord an angel, that is, a representative; but he is sometimes called the Lord, sometimes he is merely a messenger. Both are correct; but the language puzzles the ignorant; so also it puzzles them to think that God and Satan should be sometimes represented as two, sometimes as one. If they were merely to consult their own nature, they would find two contrary principles working within them, though there be only one individual consciousness after all. This is merely the type of universal nature, for we are all made in the image of God.

Saul is generally regarded as a type of the evil principle, inasmuch as he was dethroned to be supplanted by David, the man of God, whose name means 'beloved.' But see what the spirit of Joanna says of Saul:

The mystery now of Saul I'll clear,
Whom I anointed to be king;
And then the kingdom rent from him,
As he had disobey'd my word:
A type of Satan and the Lord.

Esau is also called a type of Satan and the Lord; and this is in strict conformity with the Bible, which makes the types of Christ and Satan interchangeable; thus the Devil is called a serpent, and the serpent is the wisdom of God; and a brazen serpent was hung up in the wilderness to cure the people, of which Christ says that that serpent was a type of himself. "As Moses lifted up the serpent in the wilderness, so shall the Son of Man be lifted up;" and what can be a better type of God than the serpent, which has both the poison and the cure within itself. "I kill and I make alive, I wound and I heal;" the two attributes of evil and good the all and in all. How foolish, then, is it for men to strip him of his attributes, and imagine two opposite gods in one and the same place, the one working good, the other evil, in the bosom of each other!!

We have before us a sermon of the Rev. John Wesley, which says, that if there had been no evil in the world, man would not have been so happy ultimately. There could neither have been faith nor love, and the greater proportion of the virtues must have been dormant for ever. After summing up all the good derivable from the

fall of man, and the introduction of evil, this eminent preacher says:—

"It is only in another life that we can fully comprehend, not only the advantages which accrue at the present time to the sons of men by the fall of their first parent, but the infinitely greater advantages which they may reap from it in eternity."

Yet this man, having uttered these palpable truths, afterwards goes on like a madman, to take away all the honour and glory of doing all this from God, and conferring it on the Devil, the enemy of man! But so do all divines, all Christians, all believers! If the evil is ultimately productive of good, as all acknowledge, why not acknowledge the truth of God's own words, which say, "I create evil." We shall force them to it. Both the Bible and all other prophetic writings combine to teach it; and we shall bring them forth to stab the old faith of bigotry and exclusiveness, which must be superseded by Catholic or universal faith.

We have now demonstrated from Joanna's writings that God and Satan are one universal mind; first manifesting itself as evil, then throwing off the mask, and showing his face divine. Thus he says to the woman, "One side of my face is black, the other white." What is this but the double nature? And this demonstration accounts for all the fallacies and delusions to which believers in all ages have been subject, whilst following the powerful convictions of natural revelation, unaided and unexpounded by science. These always caused them to suspect they were visited by two spirits; and nothing is more common, even now, amongst the Southcottians, than to say of such a prophet or prophetess, he or she is visited by two spirits, because they find so much delusion and flummery intermixed with truth. If they won't be persuaded by us, who are firm believers in the reality of their revelations, time will convince them, that all natural revelation is useless without the artificial counterpart of science to expound it. It is mere somnambulism—truth in a thick cloud of mystery;—but valuable truth—truth which is indispensable to human redemption, and without which it will be hell all over.

EXTRAORDINARY MUSICAL CAPACITY.—A Paris paper contains a curious account of the musical capacity exhibited by an old woman of sixty, who had, from an early age, been an inmate of Salpêtrière (a receptacle for lunatics). A young actress of one of the minor theatres of Paris having become an inmate of the asylum, was impressed with the idea that she was representing some character, and sung, danced, and recited by turns. One day, the old woman, upon hearing the actress sing, beat time with wonderful precision, and appeared highly delighted. The moment she heard an air, she was able to retain it, and could hum it over when asked, although she could not speak; and what is still more extraordinary, an individual having sung over an air which he had composed off-hand, she caught it instantly and repeated it. An air having been played to her upon the piano, she seemed quite enraptured, and appeared to appreciate the most striking passages with the taste of a finished musician. The head of this woman is said to puzzle the phrenologists, for, so far from having the organ of music strongly marked, she is totally destitute of it.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

The Alpine Philosopher on Tuesday evening, at eight.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 27.]

SATURDAY, FEBRUARY 28, 1835.

[Price 1d.]

SYSTEM OF NATURE.

EVERY church is a true church of Christ, from the Popish church down to the Pantilers and the Jumpers.

Why? Because Christ promised his presence and spirit in the church even to the end of the world.

But was it to be a visible church? Yes, for he speaks of an ecclesiastical court; he says, if a man won't listen to rebuke, "tell it to the church; and if he neglect to hear the church, let him be unto thee as a heathen man and a publican."

Peter was the founder of this church, and the see of St. Peter has, both by Scripture and divine Providence, been declared to be the seat of spiritual supremacy.

But how can every church be a church of Christ, when they have all rebelled against the parent? We answer, how can a wife be one flesh with her husband, and how can their children be the offspring of both, when they are all at variance? Did not Christ say, "I came not to send peace, but division?" And have we not got division, according to his promise? We have got the evil fruit; the good fruit comes by reunion and mutual understanding. The first church of Christ was to be a church of division: his words are fulfilled.

Then we must all become catholics? Most assuredly. If we are not catholics, how can we be universalists? The words catholic and universal have both one meaning. All the stray churches of Christendom must be gathered to the catholic church. The principle of catholicism is the ultimate and everlasting truth.

This is an important point, and therefore we beg the reader to consider it thoroughly. If he errs on this point, he errs on every other. Let us examine what are the professed and implied characters of catholicism.

In the first place, "progress" is its distinguishing feature. "Behold, I am with you *always* to the end of the world," says Christ. This implies that the church has an arbitrary power to accommodate itself to circumstances, to follow the spirit of the age, which is the spirit of Christ. It does not mean "stand still as you are till I come back again," like the protestants and separatists; but "go on as you please; I am at your right hand to direct you." This also implies infallibility. The church at large cannot go wrong; it fulfils its destiny. These are the features of catholicism, *progress and infallibility*. And popery was right in both, but it did not know in what sense. It was a progressive church, but being the first-fruits of Christianity, it progressed towards corruption. It was infallible; but it was infallible in fulfilling the words of Christ, "I came

not to send peace, but a sword." Under the Mosaic law, the first fruits of every produce belonged to the Lord. *Men* were not suffered to use them, because they were evil—things devoted. Hence it says, every thing devoted shall be put to death. "The first-born of an ass thou mayest *redeem* with a lamb; but if thou wilt not redeem it, thou shalt break its neck." The first-born of the children of Israel were thus set apart to the Lord, but they were redeemed by the tribe of Levi, which was given in exchange; but the tribe of Levi was given to the Lord, and had no inheritance. From all this it is evident enough that the progress and infallibility of the church are still established truths, even though this infallibility has led to evil, for this temporary evil is ultimate good.

The progress of old catholicism could never have led to good. Every step which it took must have gone deeper and deeper in the gulph in which it was fast sinking. But the reaction of protestantism was the salvation of the church, by bringing it back to its first principles. Protestantism professes to stand still at the first stage.

Here, then, we have two very simple and intelligible views of the great plan of progress, in perfect accordance with the original principles of our doctrine and of all natural science. First, what is vulgarly called a *wrong* movement, producing great mischief; then a *retreat* to the first position. What we want now is a *second* movement, a second catholic church; a church that advances like the papacy, not a church that retreats like the protestant, and stagnates like a horse-pond.

But it may be replied that we depart from our own doctrine in thus renouncing protestantism. We only renounce it comparatively in respect to certain features, for we embrace it in other respects; we approve of going back to first principles when we discover ourselves in error; but having found these principles, we don't approve of inaction in refusing to act upon them.

Another feature of catholicism is its spiritual supremacy. In this it differs from protestantism, which holds the doctrine of temporal supremacy. According to the one, a priest is superior to a civil magistrate; according to the other, a civil magistrate is superior to a priest. In the reign of Adrian II. it was decreed that no bishop should alight from his mule or horse to any secular prince, all princes and emperors being to consider themselves as the equals of *bishops* (only). Taking the abstract or philosophical view of this system, it means in principle the superiority of mind to matter, the priest representing the spiritual, the prince the material de-

partment. This principle is correct; mind is supreme ruler.

In departing from this principle, protestantism reversed the order, and made the priest as much inferior to a prince as a prince was formerly inferior to a priest. It restored the principle of the superiority of the material department.

According to catholicism, the sword of the spirit is superior to the sword of steel; according to protestantism, the sword of steel is superior to the sword of the spirit.

But the sword of the spirit may be either evil or good. In the old catholic church it was evil, therefore it was better to use the sword of steel against it, than to let it continue to commit its spiritual depredations. So far protestantism was right; but when the sword of the spirit changes its character, and works with fundamental truths instead of fundamental errors, then protestantism becomes wrong, the sword of steel and all external compulsion ought to be abandoned; we must resume once more the sword of the spirit, and this becomes "catholicism reformed."

Then, according to this mode of reasoning, does it follow that priests shall rule the world instead of kings and civil magistrates? Any man may answer this question by remembering that the third stage of progress combines the features of both the previous stages. Therefore it follows that neither kings nor priests shall rule the world, for the world must be conducted on a new principle. Kings and rulers at present are soldiers *ex officio*, men of blood; priests are intercessors with God *ex officio*: such offices are evil, producing great misery in society, and in these respects they will be dispensed with; but in so far as the priest acts the part of a moral teacher, an instructor and reformer of private manners, without the use of the sword, the magistrate will adopt his character, and thus become a priest and magistrate in one; whilst the priest himself will advance a step further in the progress of mind, and instead of confining himself to a few dull, unintelligible articles of a stagnant faith, he will read the whole book of nature as well as his Bible, and expand his own mind and the minds of his disciples by embracing the field of universal science within the sphere of his theology, and thus make the church what it must ultimately become—a school of moral and intellectual instruction, where all that is known, all that is useful to both sexes, will be taught and impressed upon the mind by the allurements of sensible signs, such as mechanical models and pictorial representations, to captivate the eye, assist the imagination, and direct the judgment. Thus the magistrate himself will become a priest, and the priest a philosopher. The sword of steel, being the first fruit of magistracy, will be banished, and old protestantism annihilated. The supremacy of old priestcraft, which consists in intercession to God for other men, being the first fruits of catholicism, will also be destroyed, and thus old catholicism will be annihilated. The magistrate will still be superior, and thus protestantism will triumph: but the magistrate will lose his sword and become a priest, and thus catholicism will triumph, and at all events the fundamental principle of catholicism will reign; "the spirit is superior to the flesh."

When the church is reformed upon this principle, it will become infallible in its progressive character; infallible also in another and more interesting sense than the infallibility of the Roman church; it will become infallible in leading directly to those measures most conducive to the political advantage and moral and intellectual improvement of the human race. Acting upon the simple and intelligible principles of universal truth, suited to the understanding of all mankind, and abandoning all local or historical principles, as the chief pillars of its doctrine, it will become a natural and catholic church, whose ideas will be in accordance with the nature of man, and the everlasting laws of God in every corner of the world. Its missionaries will then meet with success, for they will no longer speak in dark, unmeaning mystery, nor will that success require the aid of the sword of steel to accomplish conversion, as it did of old, when the knights templars, and other armed apostles of old catholicism, went forth in the iron strength of the Lord of Hosts, to bring over to the Roman Catholic faith many of the present nations of Christendom.

Such is our meaning when we talk of the church becoming catholic. We have no allusion to the old superstitious usages of by-gone ages, which are gone never more to be restored; but we consider it of material importance to understand, that whilst old systems of exclusiveness and intolerance must be for ever annihilated, they must be annihilated in such a way as merely to refine upon their characteristic and leading features, without entirely abandoning them. It is against Nature, a direct violation of her laws of succession and general sympathy, entirely to abandon any previous principle of action. We are all creatures of the past, and the future must come forth from the present. The triple chain that binds the first and the last together can never be broken; but innumerable variations and transformations may take place in the slow process of nature's eternal discipline.

It is amusing and instructive to observe the continual oscillation between mind and matter that takes place in the successive reformations and revolutions of the church, which are really the most important and instructive departments of history, because they are the revolutions of mind and human opinions. Priests and kings have always ruled the world, and both in succession have ruled the other, and corrected the abuses, the pride, and intolerance of the other. And such is the necessary connexion between the two departments of nature over which each presides, that it is observable, that in the Roman Catholic church, where the priest, the *spiritual* man, presided, the materialism of the church was carried to its highest degree of perfection, in the splendid ceremonial of the papal system, all whose acts of devotion seem to be nothing else but external bodily movements, whilst its objects of adoration were equally gross and distinct from spirituality, consisting of crosses, beads, images, pictures, and innumerable formalities which it would be tedious to mention. This spirit also accelerated the progress of the fine arts, which owed their revival to the genial nourishment of the spiritual hierarchy, under whose patronage the genius of painting, sculpture, and architecture, spread forth in full blossom, and equalled all that former or

after ages have accomplished. On the contrary, the spirit of protestantism, which is materialism, or the superiority of the magistrate, produced a retrograde movement in every respect; it not only returned to first principles in faith, but it abandoned all the improvements of art; it destroyed the works of cultivated genius, and refused to patronise the genius of the arts; it abandoned the outward ceremonial of the ancient church, and prided itself in a purely spiritual religion, which had little or no connexion with the flesh. The Scotch church has gone nearer the original than any other establishment.

To crown all, and to make this analysis of the church more complete,—the spiritual Roman church maintained the doctrine of justification by works of the body; whilst the material protestant church maintained the opposite doctrine, of justification by faith only. Luther says that good works will never procure salvation; and the thirteenth article of the church of England says of good works before conversion, "We doubt not they have the nature of sin." We need not wonder, then, at one reason which Anthony Ulrick, Duke of Brunswick, gave for his conversion to the Roman Catholic faith, namely, that "protestantism teaches that good works are no ways necessary to procure salvation; and what is yet worse, it says that good works are *sins*."

These things are curious to a mind which has never been properly educated, but as soon as he is taught to analyse nature in a scientific manner, he becomes astonished at his former ignorance, and wonders that he could be so long blind to the simple fact that if it were otherwise it would be out of all harmony with nature. These antitheses are merely the counterpart in the spiritual or mental world of what chemical action is in the mineral world. The positive and negative forces seek each other. The spiritual seeks the material, and the material seeks the spiritual. Hence it follows that man, who, as we observed last week, represents the spiritual, holds the material sword; but woman, representing the material, has the moral power, which will ultimately overcome the former. Woman is a refinement of man; her nature is posterior in its formation; she is therefore properly represented as last created; she is the end of the old world, and the new can only begin with her complete emancipation from the curse of the first.

Since we wrote our last article, we have discovered a very curious old book in the British Museum, which reasons upon principles much resembling our own, which we mean to examine more at leisure. It is called the *Mother Joanna*. It is nearly three hundred years old. There is one particular illustration which struck our fancy. The author observes that the male is the spiritual, or superior, the female is the temporal, or inferior; and therefore, he adds, at the time of *Mrs Joanna's* appearance in Christendom, which was the time of the reformation, all the inferior or other hemisphere of the world was discovered, or re-explored—America, Cape of Good Hope, Indies, &c.; and we may add, a new stage of progress was gained, in the memorable achievements of the reformers of the Christian church, which for ever annihilated the old papal hierarchy. We shall employ this little work for the benefit of our Southcottian friends in

particular, but all parties will derive instruction from it. It shows how beautifully and harmoniously nature brings forth signs in individuals of what she is about to do on a large scale with nations and systems. The old Joanna of the papacy is quite the counterpart of our modern bride, and much more extraordinary. But her followers, like the followers of the English bride, mistook the sign for the thing signified. The thing signified is a magnificent mental revolution, and we shall have it; the travelling of the church in bringing forth a new birth in the hearts and heads of men and women. It shall far exceed the former birth, and be accomplished with more spiritual and intellectual means.

THE SHEPHERD.

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER IX.

Anch' io son pittore!
I myself am a magician!

OFTEN whilst I wandered over the Alps, when the eagle soared over my head, where the waters of the mountain rushed in torrents from the cliffs in the deep abysses; when the avalanche, with thundering fury, hurled from the ice mountain, involving in the whirl of its ravages rocks, trees, cottages, and cattle; when the clouds under my feet moved to and fro like the hosts of the Lord arrayed for battle; often in this majestic scenery I felt my heart beat louder and louder; my soul longed, as it were, to leave the heavy burden of the body, and to expand itself like an invisible gas through the blue arches of the temple of Nature. It was then, also, that my mind first meditated on the primitive laws of universal life; that life which, through the means of the two principles (bipolarity), calls forth plurality from unity, and unity from plurality, and presents the phenomena of light and gravitation, centripetal and centrifugal power, attraction and repulsion, sympathy and antipathy, good and evil, health and disease, liberty and necessity. It was then that I found, also, that all that is has a double life, an individual and a universal one; and that both forms of life are but manifestations of the one spiritual life, which is God emerged and emerging from nature. I found that his magnetic spark kindles the whole creation, and that the ashes are nothing but seeds of new combinations.

One day, 1st October, 1819, while returning from one of these excursions—it was on a beautiful autumnal evening, when the sinking sun in the Alpine regions, and particularly in the valley of Chur, presents one of the most glorious specimens of sublime scenery that I ever witnessed. I was about two miles distant from town, when I met the Rev. Mr. K., one of the principal clergymen of the synod of that canton. "I am just looking out for you," said this gentleman, "and I am glad to find you, and to meet you alone, that I may have a little conversation with you." He then took my arm, and began to relate the history of the malady of his wife, whom I knew not even by sight. After having complained how hard he had been visited by God, he

finished, saying "and yet I have a hope to have her restored, if you will undertake her cure." "But how shall I cure her," replied I, "if all those consummate physicians of whom you speak have failed? You have consulted Autenrieth, Rahn, Eschenmayer, Plouquet, and many others; her present physician is a very able man; how can you have confidence in me, who am quite a stranger to you?" "I know that you have studied animal magnetism," replied the parson, "and it is in animal magnetism that I put my trust: would you be kind enough to undertake a magnetical cure?" "I must first see the patient," answered I; "secondly, I must be sure that, from the moment I undertake the treatment, all kinds of physis be banished. Either I will not venture the cure, or I will take all responsibility upon myself. Moreover, are you sure to possess the self-command not to waver if any thing should occur that, according to appearance, might seem to threaten your fondest hopes with destruction?" "I trust in God and in you," said the parson. "Well, then, under these conditions, I come immediately with you;" and so along we went; and, after a short walk, we entered the sick-room.

Mrs. K., the daughter of a clergyman in Tubingen, had suffered much in her fifteenth year, from the difficulty of menstruation; her organization, however, seemed perfect; she was tall and well-formed, endowed with a temperament in which the nervous and the sanguine appeared happily mixed. From this epoch she suffered periodical accesses of hysterical convulsions, headache, &c., for several years. All means adapted to cure this habit having failed, her parents were given to understand by the physicians that matrimony alone would restore her health. A few years after, she married the Rev. Mr. K., and the predictions of the wise men seemed at first to be realized.

Yet these predictions soon turned out to be altogether fallacious. As soon as she was in the state of pregnancy she was assailed with most terrific convulsions, and loss of blood, which ended on the third month with abortion. During five years of matrimony she had suffered four times the same torments, and her constitution was every time broken down more and more. All that medical skill could suggest had been tried, but in vain. The most honest among her advisers acknowledged that they knew no more what to do. Professor E. of Tubingen advised the magnetism, but only then when the state of pregnancy was over.

The good lady was lying on her bed, reduced almost to a skeleton; she was pregnant; a flux of blood, alternating with convulsions and vomit, had deprived her of appetite, rest, and almost of the last spark of life. Her pulse was so low, that it could be felt with difficulty. The colour of her face was grey white, her lips parched, her eyes sunk. Seeing a stranger come into the room, she was attacked immediately with spasms. I made seven calming magnetic turns, with the flat hand, from the forehead to the extremity, and she was appeased. After conversing a little with the patient, I retired with the clergyman, to whom I said that the case was very dangerous, yet not to be despaired of. I would undertake the treatment, provided I could begin

immediately, and have the patient wholly under my direction; to which the Rev. Mr. K. having readily agreed, I began the treatment the same evening at eight o'clock.

My treatment was first directed to stop the loss of blood, as the most dangerous symptom. After fifteen minutes' manipulation the patient felt a little fatigue, but gave no other visible sign of being in any way affected by magnetism. My treatment consisted first in elliptical calming strokes from the forehead to the feet, at half an inch distance from the body, without resting upon the stomach or the uterine regions; afterwards in negative strokes from the uterine regions to the stomach. All sorts of medicines were removed. The diet I ordered was farinaceous and mucilaginous food—sago, gruel, &c.

The second day the same treatment. My simply crossing the stomach with the calming strokes, caused, after ten minutes' manipulations, a violent spasmodic asthma, which I was obliged to relieve by ventilation. I continued the operation for twenty minutes; after which she felt herself a little relieved. She had passed a more easy night, and had taken a little food without vomiting. Thus I continued for seven evenings, without any abatement of the symptoms. The seventh evening, after ten minutes' manipulation, the asthma became more violent than usual. I placed gently one hand over the plexus, and one over the forehead. Instantly the spasmodic attack ceased, and a few minutes after she fell asleep, and awoke after half an hour visibly improved. She drank a bottle of magnetic water.

The following night she slept soundly, and dreamed, and spoke during her dream. Her husband, who watched her, could not comprehend her broken language. He put his hand upon her plexus, but immediately was obliged to remove it, his wife being immediately attacked with the spasms.

The next morning she awoke quite refreshed; to the astonishment of her husband and nurse the blood was stilled, and she felt herself so much better, that she could get up from her bed, and walk about in the room. On the evening of the eighth day I found the patient sitting in an easy chair; her lips were already more coloured, and her whole countenance announced more strength. On that evening she fell asleep after five minutes' manipulation. I continued, however, to operate for ten minutes longer, when she gave me to understand with a nod that it was enough.

Nothing particular occurred till the fourteenth evening. In the interval, however, her health had improved. On that evening, scarcely had I finished the third general palmar manipulation, when her eyes began to roll convulsively; her eyelids to shut and to open with great quickness; after which she gave a loud deep sigh, and fell into a high degree of somnambulism. I continued the operation for ten minutes; I observed that she tried to utter some words, but was unable to do so on account of a spasm in her tongue. I magnetised her throat and chin, and after a while she was able to say "Water, water!" I gave her a glass of magnetised water, which she drank with greediness, and exclaimed, "Oh, that is good and strengthening!" She made me signs to continue the strokes over her chest, and over the extre-

mities. After awhile she said "It is enough." I was fixing her with my eyes, and with the most concentrated will, to make her speak. She continued silent for some minutes, then she addressed me: "Do not force me to speak this evening; I am too weak. It is yet too dark around me, and in me. I see nothing but a feeble gas around you; also the water shines a little. I shall sleep thirty-three minutes longer; but to-morrow I shall see clearer."

But it was on the 20th day that the somnambulist gave the first opportunity to observe the power of the telluric life in some of its most remarkable features. On this evening she foretold that her cure would be accomplished on the 28th of December, but that she ought to be magnetized a month longer, in order to give strength to her foetus. She was asked whether she would have a lucky child-bed. "To be sure," answered she; "you magnetize me, I magnetize the dear little creature, and we shall both do very well." "Can you tell me whether it is a boy or a girl?" "A boy; a nice healthy boy! Now I am thankful to you that you have preserved his life, and my life too."

After a moment's silence she showed great sorrow in her face, and then exclaimed, "My child will live, though nobody ever dreamt I should recover; but Mrs. B. will soon have to bewail the death of her baby, though he looks the picture of health." She spoke that in the presence of some gentlemen and ladies. Both events took place literally as foretold.

From this time the somnambulism developed itself clearer and clearer. One evening she was asked whether she would see a patient, and prescribe for him. "I will do what I can, though I know nothing of physic." The patient was a gentleman aged twenty-three, who was given up as incurable by several physicians. His disease had been named first a nervous, then a tracheal decline. The young gentleman was introduced to her; she desired me to take his hand, and place it upon her stomach. After five minutes' silence: "Oh, the doctors!" exclaimed she. "Behold another victim of their absurdities! This young man suffers from worms; I see them moving in the slime of his bowels; and his physicians have ordered him blisters. Have you not a blister now over your chest? The patient answered in the affirmative. "Go home and put it away, and have it dressed, and have all phials thrown into the dust-hole."

A gentleman begged me to ask what kind of worms afflicted the poor young man. "I do not know their names; but I see them. Here (she pointed to the higher bowels) I see the one kind, some half a foot long; I see them curling. Here (she pointed to the lower bowels) are the small ones; small and thin, but very lively."

"How do you see that?" asked I. "I do not know how, but I know that it is so."

"What shall he take to remove them?" urged I. "You are a physician, and you know it yourself; but I will think of something." She afterwards prescribed a powder composed of seeds, some bitter aromatic bark, and sulphate of iron. She did not know how to name the seeds nor the bark; but she would be able to choose the right ones, if presented to her.

I sent to a friend of mine, an apothecary, to send me several samples of seeds and aromatic barks. He sent the seeds of mustard, santonium, sebadilla, cummin, and anebtic; and the Peruvian bark, cascarilla, sassafras, Angustura vera, Angustura spuria, and horse-chestnut. The seeds were first presented to her; she put each of them upon her plexus, and chose semen veratri sabadil. I asked whether she knew this seed before, or its virtue? She denied it. Among the barks she chose the Angustura vera, which she likewise never had known before.

I asked whether the other bark, the Angustura spuria would do the same, and she answered no; it would be injurious. I put then the Peruvian bark into her hands, and repeated the same question. She began to smile. "That bark I know too well; and the gentleman knows it also; we both have had enough of it."

"How much shall the patient take of these powders?" "I will show it to him to-morrow evening. I begin to be fatigued."

This fact, of which several persons were witnesses, is one of the most decisive in the matter of somnambulism. The young man took off his blister, threw all the physic into the dust-hole, and after having taken two of the powders, the fact proved the justness of the somnambulist's clear sight. By continuing this method, and the use of a bitter wine, which she on another occasion recommended, the young man was completely recovered.

It was, however, with the greatest difficulty that I could bring her to prescribe any thing for herself. Magnetism, and magnetic water, and magnetic food, was all that she could prescribe for herself. Her health improved rapidly, and her *clairvoyance* brought daily new customers before her, not only to seek physical, but in some cases also moral advice.

A lady, Mrs. B., the wife of a colonel in the Swiss service in France, had for a long time heard nothing of her husband. She had written to some other friends, but by some chance or other she had been deprived of an answer. The poor lady was fretting, and to have some consolation she requested me to allow her to put a question to the somnambulist. I never allowed any one to annoy her, unless having her permission. At that epoch, there was no need to magnetise her to bring her into the crisis. *My will* had then such an influence, that I could bring her to sleep whilst walking down the street to visit her. So I did that evening on which I wished to introduce the wife of the colonel. I found my patient asleep when I entered the room. Two friends were sitting by her side; one, the first magistrate of the town, the other the husband of the lady whose child's death she foretold.

When I approached her, and asked whether the lady in question might be sent for; she replied, "it is quite superfluous, my friend; her husband is on the road to her, and will be here at nine o'clock; but send to her, and let her know, because, otherwise, her nerves might suffer too much." One of the gentlemen went to the lady with the news, and remained there waiting for the result. By the stroke of nine, a postchaise was before the door with the beloved husband.

These are facts; and similar facts have occurred at the same time in Berlin, Paris, Stuttgard, Carlsruhe, and St.

Petersburgh. The somnambulists, in all these cases, were respectable persons, broken down with disease, and who had no other aim, no other end, but to be cured; and where the physician and philosopher had no other object in view but the mediate one of relieving the disease, and the more general one of forwarding the science.

On the evening in which the somnambulist had so clear a view of that which was passing at a distance, she also gave the most clear examen of her inward structure, to the satisfaction of a sceptical anatomist, who went away with the idea that the lady must have acquired this knowledge in her youth, from reading anatomical books, and overhearing the conversations of medical professors. But the good lady, when awake, knew not even the distinction between nerve and muscle, or vein and artery; she had received a very excellent, religious, moral, and liberal education; but had been kept entirely from the study of the structure of the human body.

After having described the healthy state of her inside, she broke out in bitter complaints against the physicians, who had destroyed her vigour by the abuse of medicines. "I shall now get well," said she; "but I have here an organic disease which affects my nerves." She showed me then a kind of knot, which was formed by a bundle of crural nerves. "This knot ought to be cured; but it can never be entirely removed: it is of too long standing; the only remedy for softening it is the juice of the common onion, which must be obtained in the following way." Here she described the method of extracting or decocting the juice most minutely; and I must observe that, during the day, she had the greatest horror at the sight of onions, and would absolutely not use that which she had prescribed for herself during the somnambulism, so that we were obliged to anoint her during the crisis.

The somnambulism ceased at the end of the third month. I magnetised her the whole month following, thirty minutes each time. The sleep that followed the manipulation decreased from day to day. The last week the magnetism had lost, apparently, all power over her. But her cure was so full and perfect, that she astonished every one who had known her before. She looked strong and healthy; appetite, rest, every function were restored. At the end of nine months she gave birth to a healthy, vigorous boy.

This lady is the first, but not the only patient, whom I restored to health by somnambulism. I had several of them, more or less clear-sighted. I have chosen this case because the quality of the disease, the circumstances which accompanied it, and the felicity of the result, seem to go as near to the point as any of those reported by the magnetists of other countries.

I cannot help mentioning a laughable occurrence which took place on this occasion.—Two female attendants of the patient, peeping through the key-holes whilst I was magnetising her mistress, saw me moving my hands in a strange way, whilst her master, with a book in his hand, stood near her bed, thought we performed some enchantment. They were so frightened at it, that both were seized with spasms; and other complaints, which made the poor females fancy that they were bewitched; in consequence of which they went and

accused me *formally* before the chief ecclesiastical authority of the canton, although he did all he possibly could to persuade them of their folly. Seeing the impossibility of checking my magic, they both left the service of Mrs. K., and spread abroad the tale that I had transplanted the disease of their mistress to them.

Behold the origin of the magical reputation of

THE ALPINE PHILOSOPHER.

ADDRESS TO DEITY.

In lightning's vivid flash can we
Discern an angry hand?
Does rolling thunder e'er proclaim
Destruction to the land?

If tempest, famine, pestilence
Rage, and on thousands prey,
Can we believe omnipotence
Mortals creates to slay?

If, centuries since, our fathers sinn'd,
And worshipp'd gods of clay,
And did, no doubt, deny thy power,
And doubt a judgment-day,—

Shall we, because we sprung from them,
Be doomed to suffer here?
Shall they not expiate their crimes?
Wilt thou be so severe?

Will not thy jealousy relent?
Or is it thy command
That nations yet unborn shall dread
Thine all-avenging hand?

Till all the elements combined
Shall change the wondrous plan,
The greatest scourge to human life
Is savage man, to man.

Search nature's laws, and learn from them,
Volumes of boundless space;
Impartial kindness reigns throughout,
To bless the human race.

Then grant that prelates may not preach
The terrors of thy rod;
But men may look at truth alone,
And worship nature's God. G. H.

CATHOLICISM IN IRELAND.

THE revenue of the parish priest is derived from a variety of sources. There are confession dues, marriage dues, baptism dues, mass dues, and dues for anointing. He is also paid at times for attendance at funerals. Confession furnishes the most steady and constant source of revenue. Twice a-year he collects confession money, under the denomination of Christmas and Easter offerings. The mode of making this collection is not very consonant to the spirit of religion. The priest selects one or two houses in every plough-land or neighbourhood, where he holds according to appointment what are called "stations of confession;" and it is required that the families all about should meet him when he comes among them, upon these occasions; should make their confessions, receive the holy sacrament, and finally pay the customary dues. It sometimes happens that this business is not transacted quietly. If increased dues are demanded—a thing of occasional occurrence—disagreeable and sometimes scandalous altercations ensue. Similar scenes occur when individuals attend and crave time for payment; while such as absent themselves, unless they send the dues as

an apology, are generally made the subject of public abuse and exposure. All these things take place in connection with the celebration of mass and the administration of two sacraments—penance and the eucharist or the Lord's supper. The association must be admitted to be rather an unholy one. If no money was to be paid on such occasions, all things would go on well, and the whole scene would be religious and edifying. But the intermixture of money transactions, and money altercations, changes the entire scene, and proves at once a fatal counteraction to all the previous works of devotion. Most certainly the good of religion requires an alteration in this matter. But supposing all things to go off quietly and without a murmur, is it right that the payment of money should be coupled with the administration of religious rites? The custom on the face of it bears an unholy complexion. It transforms religious rites into merchantable commodities, which the priest prices and turns to his own advantage in the best manner he can. He gives and he gets *quid pro quo*. This is the appearance of the thing; and the common people do imagine that they pay their money in lieu of getting confession and communion. So deeply, indeed, is this persuasion engraven on their minds, that they consider themselves exempt from the obligation of payment, unless they actually get absolution and the holy sacrament, that is, value for their money.

Come we now to another item of ecclesiastical revenue—marriage money. Marriage is universally acknowledged to be a holy rite; but it is numbered by the Catholic church among the sacraments of the new law. The administration of it, therefore, should be accompanied by every circumstance of solemnity and holiness, to the utter exclusion of everything of an opposite description. But is this the case? By no means. The administration of this sacrament or rite, generally speaking, takes place under circumstances by no means conformable to the spirit of religion; and all this in consequence of the pecuniary demands made on such occasions. The first thing done, when there is a question of marrying a couple, is to make a bargain about the marriage money. This sometimes causes a considerable delay. The remuneration or stipend prescribed by the diocesan statutes is never thought of for a moment. Indeed, all statutes respecting money matters are a mere dead letter. The priest drives as hard a bargain as he can, and strives to make the most of the occasion. Marriages are sometimes broken off in consequence of the supposed exorbitance of the demands. All this is in opposition to the intention of the church, and the spirit of religion. It is simony to all intents and purposes—that is, selling a sacrament or spiritual thing for money, and putting on it a worldly value according to the dictates of avarice and caprice, without any reference to fixed rules and regulations. But this is only a preliminary proceeding. Demands of money are made upon such as are present at the marriage—at least upon the male portion of the assembly. This gives rise not unfrequently to a new and unhallowed scene. The transaction may by chance pass off quietly; that is, when every one pays according to the wishes and expectation of the clergyman. But this does not always happen. In general the demands are considered unreasonable, and the priest is disappointed in his expectations. Some endeavour to evade the payment of any contribution: others give but little; and the few that please the priest are mere exceptions to the general rule. What is the consequence? The clergyman, after begging and entreating for some time to little purpose, gets at length into a rage, utters the most bitter invectives against individuals, abuses, perhaps, the whole company, and is abused him-

self in turn, until at length the whole house becomes one frightful scene of confusion and uproar: and all this takes place at the administration of one of the sacraments of the Catholic church—owing too to the present system of ecclesiastical finance. If nothing was to be paid on these occasions all this scandal would be avoided, and the marriage would be celebrated in a suitable manner. The money part of the transaction causes all the canons of the church touching matrimony to be set at defiance. The publication of the banns prescribed by the Council of Trent is neglected: and why so? Because money must be raised for the maintenance of the bishop, to whom belongs the mulet for license or dispensation. The pecuniary wants of the bishop are the weighty reasons by which it is said he is moved to dispense in the triple publication of the banns of matrimony. This omission gives rise to numberless abuses. Clergymen, particularly in cities and large towns, are frequently imposed upon by persons who present themselves for marriage. Clandestinity is practised with ease; children get married without the consent or knowledge of their parents; and persons easily succeed in throwing the priest off his guard, who by reason of affinity or consanguinity, or other mutual relationship, labour under canonical impediments. This would not take place if money were out of the question. For in that case the banns, as in other countries where there are church establishments, would be regularly published; and no advantage could be taken of the comparative privacy with which the business under existing circumstances may be transacted. The banns, by right, should be published and the marriage celebrated in the parish chapel or public place of worship, openly before the congregation. This is the canonical mode—a mode that cannot be observed under the present system of church finance. The necessity or the eagerness for money, and the danger of losing it by delay, occasion the clergyman to dispense in the necessary preliminaries for marriage. The church orders that those who are preparing for marriage should approach the tribunal of penance and make a sacramental confession. This ordinance is agreeable to the doctrine that matrimony is one of the sacraments of the new law; and one of that description of sacraments, which, to be received worthily, requires, according to the doctrines of the Catholic church, the person receiving to be in a state of grace. The preparation for matrimony, therefore, should be similar to that required for the reception of the eucharist or Lord's supper. This is an ordinance very little attended to; it is in fact generally sturred over; and matrimony itself, though holding as to theory or doctrine, the rank and dignity of a sacrament, is administered as if it were a ceremony having little or no connexion with religion. The payment of the marriage money, and oftentimes the plate money in addition, is now the grand preliminary or preparation. Cupidity is the prime agent; and religion, which may thwart its gratification, is unheeded and unregarded. Thus does the present system of church finance give rise to every species of abuse respecting matrimony, both in regard to the clergy and the laity—to practices that are opposed not only to the canons, but even to the doctrine of the Catholic church.—*Pamphlet by Mr. Croly, Parish Priest.*

[Similar scenes take place with baptism and extreme unction, &c. Hence Mr. Croly urges upon Government the propriety of taking the Catholic religion under its protection, and making a sort of establishment of it. It will be much better to let it go on, and destroy itself by its own folly; but certainly some new regulations ought to be made for marriage and baptism.]

CORRESPONDENTS.

In opposition to our reply to A. D. in No. 24, J. M. quotes from the Rev. Robert Taylor the account of a zodiac found in the ruins of the temple of Esneh, in Egypt; which zodiac, he says, must be 6430 years old, (some make it extravagantly more). He might also prove, upon the same principle of reasoning, that St. Paul's cross is 1800 years old, since crosses were in use so long ago. This temple of Esneh, of which he speaks, is but a modern building after all, more modern than the cross itself: it contains, besides this ancient zodiac, to which J. M. alludes, a dedication in the hieroglyphic rings, or ovals, to the Emperor Claudius—the name is “*Cæsar Tiberius Claudius Germanicus*.” Other sculptures are considerably later. The little temple of Esneh is much older than this. Champollion found in it a dedication by Thothmosis, who lived about 1528 B. C. But the style of architecture and other circumstances have determined its epoch to be about the time of Ptolemy Epiphanes. It is dedicated to the trinity Knuphis, the goddess Neith, and Young Haki. As a specimen of the manner in which such temples originated, we may mention that of Hermonthis, in Egypt, which has also an antique zodiac. The bas-reliefs prove that it was built when Cleopatra had brought forth young Cæsarion to Julius Cæsar, and it was dedicated to the trinity Mandou, the goddess Ritho, and their son Harphreh; in other words, Cæsar, Cleopatra, and young Cæsarion. The antique zodiacs, which puzzle antiquarians, and captivate the credulous and fanciful amongst the infidels, are, after all, mere emblems, not remnants of antiquity. There was a belief amongst all nations, that the gods had once reigned on earth; and knowing somewhat of the precession of the equinoxes, it was natural enough for the priests, when they consecrated a temple to a particular god, to consecrate also an astronomical emblem, indicative of the time when the god was supposed to have lived. This accounts for the extraordinary difference between the zodiac itself and the age of the temple where it is found, which is comparatively modern. It is somewhat amusing to see with what confidence infidelity reposes upon the letter of one species of priestcraft, when it wants to overturn the mysteries of another. But this is not the way to get rid of mystery. The *Encyclopædia Britannica* has the following sentence upon the large temple of Esneh: “According to conjectures, founded on a particular mode of interpreting the zodiac on the ceiling of the large temple, this monument has been accounted the most ancient in Egypt; but the style of the sculpture, and, above all, the hieroglyphical inscriptions, prove it the most modern.”

All records, both astronomical, historical, and hieroglyphical, date their commencement within the last 5,000 years; and in fact, unless it be the Indian tables of Tervalore, which date 3,102 B. C., there are scarcely any within the last 4,000. The Chinese have a list of eclipses from the year 2159 B. C., but the second eclipse on the list is 776 B. C., or 1383 years after the first; after the second they are pretty regular, and it was only about a century before Christ that the Chinese had discovered rules for calculating eclipses. Diogenes Laertius makes mention of 373 eclipses of the sun, and 832 of the moon, observed in Egypt during a period of 48,863 years; but all these eclipses, it is calculated, may have occurred in the short period of 12 or 1300 years. It is well known that the ancients prided themselves in antiquity, as our own nobility do at this day, and therefore they vied with each other in throwing back the era of their first nationality, and all the proofs which exist of their

assumed antiquity can easily be referred to this universal rivalry; there are no unequivocal proofs to satisfy a candid mind.

The Tervalore tables presuppose considerable knowledge of astronomy; but astronomy is the first of the sciences. Men observed the stars before they observed the elements of the earth which they inhabit, and when they were all collected together, as common sense and universal tradition testify they were, they devoted themselves most ardently to the study. They were finally scattered. Some preserved the love and the records of science, and others degenerated into savages and barbarians. These Indian tables are the records of an ancient people, the fathers of all nations, whose language is found in the roots of all languages, from one pole of the earth to another.

When we said that the chronology of Moses had never yet been shaken, we did not mean to insist upon the exact number of units in the Jewish chronology. Perhaps the Septuagint is as good authority as the Hebrew Bible; and perhaps the now universally received chronology of the moderns, corrected by the aid of great research and astronomical science, is more correct than either; but we mean to assert, that no man can prove the human race to be older than 6,000 years from any existing records.

We are sorry we are so long in answering a correspondent from Preston respecting the transfusion of blood. We overlaid his letter, and forgot his address, and this was one cause of the delay; another cause was our inability to give exact information. We understand it is practised in London, but we cannot take it upon us to recommend it. Perhaps our friend from the Alps will give us a few words upon the subject, as he has been regularly bred for resisting the Devil in a bodily shape, whilst we were ordained to assail him spiritually.

We had not resolved not to insert J. S.'s articles. We admire them much, and remember well the many excellent things we used to receive from him on former occasions. Nor do we think it at all inconsistent with perfect liberality to use our own discretion in the selection of matter for our little work. We have a specific object in view—to correct the errors of both extremes, and therefore we prefer such articles as have in view to reconcile those extremes by resorting to the “standards” acknowledged by both. Were it any thing directly opposite to us, we would insert it more readily than when it has every appearance of being at one with us, whilst at the same time it has a sort of indefinite meaning, which leaves it difficult to determine what the author is in reality. We shall probably insert them next week.

A correspondent, who wants some parliamentary news, may have them in the Political Register (late Pioneer), or the London Free Press, by applying to our publisher.

A LECTURE upon Tellurism, or Animal Magnetism, by THE ALPINE PHILOSOPHER, at the request of the “Society for the Acquisition of Useful Knowledge,” on Tuesday evening, March 3, at Eight o'clock, at 36, Castle-street East, Oxford Market.—Admittance Free.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSTNS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Bready, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 28.]

SATURDAY, MARCH 7, 1835.

[Price 1d.]

SYSTEM OF NATURE.

THERE is one peculiarity about the papacy which distinguishes it above all other systems, and that is its entire rejection of the system of hereditary nobility and hereditary legislation.

This is quite in character with a spiritual system. Hereditary succession belongs to materialism.

The popes in general rose to the chair of St. Peter from the lowest grades of human society. Those were literally times in which the poor man was raised from the dunghill, and set among the princes of the earth. Cardinals, bishops, and all ecclesiastical dignitaries ascended the steps of spiritual domination in a similar manner.

This system was the natural consequence of the celibacy of the clergy. Had they been married men, with families of their own, no such laws would ever have been framed. Hereditary succession would have been practised as in other governments, and the papal dignity would have descended from father to son in lineal succession. But who does not perceive that this would have destroyed the harmony of the system, and the perfection of the type? In a spiritual system like the papacy, it was necessary that spiritual succession should be adopted; and for this purpose, Nature, long before the papacy was organized, operated upon men's minds to desecrate the matrimonial life, as suited to the profanity of the laity only; thus constituting a clerical type of the New World, in which "they shall neither marry nor be given in marriage, but be as the angels of God."

This system of an aristocracy of talent and election belongs in an especial manner to the church. It still continues in all the protestant churches, because the instructors of the people require at least to be full-grown men, although it is not considered necessary that the governors of the people be such. Hereditary succession has only been practised in the civil department, and this has in general been the cause of much of the corruption which has taken place in the other. Had men been selected to the magistracy and the sovereignty for their virtues and talent, instead of their birth merely, the result would, no doubt, have been very different from what it has now proved. But even to suppose this in an age of ignorance and religious division, is to suppose an impossibility. The dissensions which existed in all ages upon the all-engrossing subjects of politics and religion, rendered it wise and politic to employ the system of hereditary succession in preference to the feuds and bitter animosities which must have been consequent upon an elective system. Hereditary government has fulfilled

its destiny. It has caused, but it has also prevented, much evil; and we have little doubt but it has prevented more than it has occasioned.

Amongst the numerous evils which it has occasioned, is that of corrupting the other; namely, the spiritual succession. By taking the church under its own protection, or entering into a holy alliance with it for mutual advantage, it has continued to secure the rights of ecclesiastical patronage to itself, and thus render the principle of election in the church null and void. On account of the domination and corruption of the hereditary system of the state, the elective system of the church has never been fully developed. It was only in the golden days of the papacy, when Adrian the Third enacted a law that the emperors should no longer confirm or interfere with the elections of the popes, and for a few succeeding generations, when the prosperity of the hierarchy was at its utmost height, that it was enabled to exist in a state of separation from the state; now it is completely buried in political corruption, and the rights of election transferred to hereditary princes and barons. Boniface the Second, 530, decreed that no bishop should appoint his own successor, and Boniface the Third, 606, ordained that bishops should be chosen by the clergy and people, and approved by the pope and civil magistrate. This was the foundation of a good system of representation and elective government, but it has since been overruled by the imperial, the royal, and the aristocratical power, and become a dead letter.

But we must make a distinction between the principle of catholicism and its corruption. Its principle is that of an aristocracy of talent and virtue, instead of an aristocracy of birth. It maintains the primitive equality of all men, from the lowest beggar that sleeps on the dunghill, to him who fills the throne of St. Peter, who, perhaps, was once that beggar himself. It admits of every distinction and gradation of rank; but its offices are not supposed to be filled up by the bodily descendants of the present incumbents, but only by those who shall be found qualified by the acclamation of the public, or the suffrage of the council. Such were the nobles of catholicism in its best days, and such must be again the nobles of mankind before we can ever congratulate ourselves upon having accomplished a final reformation of abuses.

We find a very different system prevailing at present; a system of extreme injustice, which confers all the honour and all the power of government on the blood and the flesh, instead of the mind; a system which never consults whether the individual be qualified to govern or not, but only whether the Lord Chancellor has

certified and sealed that he or she is a legal descendant of the predecessor on the throne. Nor is this custom confined to royalty; it prevails throughout the greater and lesser nobility; whilst any individual, by the law of entail, may secure his property to his first-born in perpetual succession. Thus the land becomes inalienable in the hands of its ancient usurpers and their offspring, and the government and legislation of the country become also theirs as a necessary appendix.

Yet there never was an institution of greater corruption and cruelty than catholicism. It exceeds in depravity everything which history has recorded, or romance invented. How, then, is it possible that there can be any good thing in that which has produced such evil fruit? How (we reply) can there be any good thing in the human race, which has exceeded in cruelty and rapacity every other species of animal? It is a universal law of Nature that that which is susceptible of the greatest degree of corruption is also susceptible of the most perfect polish. The shark devours its prey with a single snap, and terminates life and suffering in the twinkling of an eye. Almost every beast of prey is eager to put an end to the life of its victim. Even when the quiverings of muscular irritability, in the lifeless frame, indicate the existence of some remnants of vitality, the devourer exhibits symptoms of a rude sensibility, in instantly directing his jaws to the spot, or treading upon it with his foot, in order to still with as much expedition as possible the sensations of pain. He is merely the agent of Providence, of Nature, of God, who has decreed that life shall prey upon itself. The sportsman, who makes the work of destruction a pleasure—an elegant amusement—who takes away life merely for the pleasure of killing, is more refined in cruelty than the beasts of the field, or the fishes of the ocean. But that very faculty which refines his cruelty also refines his sympathy, so that in the same individual there actually exist the two opposite extremes of kindness and cruelty. The same law prevails throughout all nature. Nature is every where the same. When you have analysed an inch of the universe, you have analysed the whole; for in that inch all Nature, the infinite God, is concentrated—the eternal three in one. Do not wonder, then, that we point out this feature in the catholic church, the most diabolical system that ever was instituted, and yet a system so generous and sympathetic in its tender feeling, that it deserves above all other systems the name of the poor man's religion. Its cruelty to the heretic was only surpassed by its kindness to the submissive and unoffending poor. But its palmy days are over; its virtues are forgotten, and its vices alone deform the pages of history.

It was the spiritual and instructive character of its government that gave it this superiority. It preferred the spiritual and the moral to the physical power; but without the latter it could not stand; it must either become a tyrant, or die; and systems, like men, will purchase life at any price. Suicide is an exception to general nature.

Its spiritual character was merely blind faith and mystery, without science; it could not convince, could not satisfy. It was like the diamond or the gold in the ore; it

wanted an operation to give it authority and currency amongst men; for that operation, it had itself prepared a furnace in its own purgatory, a doctrine peculiar to itself. Into that purgatory it was literally cast. The reformation arose with the dawnings of material or physical science; a new flood of thought was poured out upon the human mind. Old faith was dissected; superstition withered before the sunshine of reason; the church died in proportion as science elevated its head; till at last the whole system was paralysed by the philosophy of French materialism; and the emperor of France, with the material sword, completed the triumph of the principle of protestantism.

Protestantism is the purgatory of the church; its own purgatory, the purgatory of the priests and their frenzied followers, is an illusion of their mystical institution, but not the less true in its typical and terrestrial meaning. The old church has taught, and still teaches, the necessity of an intermediate state of purification, and protestantism has invariably rejected it. Why? Because there really was a purgatory ordained for catholicism, but none for protestantism. Protestantism is not the church; it is the furnace of the church, to burn up the dross, and destroy the evil of its first character; it is the womb into which the church returns in order that it may be born again. It follows, then, that catholicism cannot bring forth the true and the final system. That system comes out of the purgatory of the church, the womb of its second and great mother. Hence all attempts in a catholic country must fail; we say it with a confidence which cannot be shaken.

Protestantism is the mother of the new and universal Church, of the second Catholic system, having the original likeness of the old man, but purged of all his dross, his superstition, his exclusiveness, and his cruelty.

The world is preparing for it. The Spirit of Peace is extending his wings over the whole of civilized Christendom. Necessity, on the one hand, compels the warriors of Europe to keep their swords in their scabbards. The increase of knowledge and of social refinement amongst the people has created a general aversion to bloodshed and violence. Glory no longer consists in the laurels of war, and the crowns of legalized homicide; the influence of reason, persuasion, and gentle mediation, though not yet well reduced to practice, are recommended and preferred. The new millennial system is already taking root in the human mind, and it only wants a doctrine in which to embody itself, and display its beauty and its omnipotence to the world.

And why should that be a church, and not a state? Because a church is a moral system, and a state is a martial system. A church is a system of instruction; a state is a system of correction; and in a more refined and perfect system the moral and intellectual power will be so far superior to the physical, that the latter will not be employed either amongst nations or individuals. A church then it must be, call it what you may; and say what you may, society will yet be constituted a church, and the spiritual and intellectual power will bear the sway; and it will yet be demonstrated that that which has proved the greatest curse to man, will prove the greatest blessing.

We are well aware that there are people with such determined prejudices and confined notions, that they will startle at the very name of a church; for they can not, or will not, be at the trouble to distinguish between a good and true church, and a bad and false one; and probably they will not put themselves to the trouble to ascertain our meaning: the word is enough for them; they shake their sagacious chins, give a significant nod, and pass sentence immediately. These are wise heads; but it is a marvel that they are not afraid of heads and intellects as well; for heads and intellects have done tremendous mischief. Why not cut off people's heads, and make them go without? and why not extinguish human intellect altogether, since such men as Pitt, and Castlereagh, and Peel, have played so much mischief with it? and why not put a muzzle on the human mouth, or a check-bridle upon the tongue; stop the career of the press, and machinery, and all the arts of life, which have all played the devil with mankind? To this length the arguments of such shallow philosophers lead; for they are not acquainted with this universal fact (although they are matter-of-fact men), that all the first-born of Nature are under the curse; but that the new birth, or reformation, purges out the evil, and transforms the curse to a blessing.

If the mind does not reign, the sword must reign. If the mind or spirit reigns, the system is a church. But we do not say, that priests shall be as former priests, nor that they shall have corporate power. They shall merely instruct in science and morals; and, so far from being the masters, act as the servants of the people; to educate the children, to analyse nature, to cultivate science and art, without the use of any superstitious formalities. Every philosopher, every lecturer, every schoolmaster, is a priest. These are the priests to whom we allude. The old priesthood must die with the old magistracy, for it is a bloody priesthood. "He that killeth with the sword shall perish with the sword." THE SHEPHERD.

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER I.

Wie sich der Sonne Scheinbild, in dem Dunst-kreis
Malt, die sie künmet, so schreiben auch den grossen
Geschicken ihre Geister schon vormus;
Und, in dein Heute wandelt schon der Morgen.—SCHILLER.

As the image of the sun paints itself on the mist, before his rising, thus foreboding spirits precede great events; because the future is already moving in the present.

THE contents of the last letter may appear strange to those who, lost in the turmoil of daily business, have not had either wish or leisure to devote their attention to some phenomena of nature, which bear the strongest analogy to those of artificial somnambulism.

These phenomena are the dreams, the visions of the prophets, natural somnambulism, the last moments of dying persons, and several forms of fancies and reveries of persons afflicted with nervous diseases, fevers, and mental derangements; beside which many of the instinctive actions of insects, birds, fishes, and other animals. Indeed, the whole of nature, even that part which the

scientific world most ignorantly call dead, or inorganic nature—stones, minerals, the gases; see, feel, love, hate, and perform many actions, which the hackneyed systems of philosophy and physiology attribute exclusively to animals possessed of the five organs of sensation. Truly, each element is in a state of somnambulism, and each has a soul and a language to express its thoughts.

The explanation of this analogy, however, will form the subject of several letters. To-day I shall continue the practical and medical part of the science of tellurism. Our readers must understand, what I cannot often enough repeat, that somnambulism is but one of the visible effects of the telluric treatment; an effect that seldom presents itself in the purity described in my former narration, and which, in its development, presents as many forms and varieties as may be found in the varieties of the human race.

Somnambulism is not necessary to the happy results of tellurism; the most wonderful cures are generally performed without it. A conscientious telluric physician will never force his patient into this state; and when it occurs spontaneously, he will watch with all his power to prevent strangers from crowding around his clear-seeing somnambulist. The want of these precautions has done more harm to the science than all the declamations and calumnies of prejudiced scribblers, and fanatic or interested antagonists.

I know a gentleman in France, who, upon his wife's being thrown into somnambulism, had opened his house as a kind of fortune-telling institution. The visitors paid fees; and this business succeeded so well, that the house was crowded every day. The consequence was, that the somnambulist was so oppressed with questions, that she awoke from the state of somnambulism in a state of insanity.

Tellurism is the most powerful agency in nature; it is a blessing in the hands of the philosopher, but a curse in the hands of the ignorant and of the empiric. I told my readers that there are many forms under which somnambulism appears; and to prove my assertion by facts, I shall relate the history of another magnetical cure, performed in the same town as the last.

My patient was a single lady, the daughter of a magistrate (Mr. J.), aged twenty-eight. Four years before she had recourse to tellurism she had caught cold in returning one night from a ball on an open sledge. From that period her menstruation was almost entirely suppressed; and the consequences of this suppression were fits, *tic douloureux*, head-ache, and occasionally mental derangement. Nothing was spared by her family in order to restore her health. She consulted the most renowned physicians at home and abroad; she was bled, leeches, and cupped; cathartics, tonics, aromatics, the martials, were lavished upon her in draughts, pills, powders, and electuaries; the natural baths of Pfeffers, of Baden, of Schingnadi, were resorted to. She drank the mineral waters of Seltzer and Pyrmont. She quitted the valley of Chur for the mountains of Engadin in vain. She gave up all in despair.

Notwithstanding all the injurious treatment which Miss J. had endured, her appearance, at first sight, was

that of a person in full health ; yet her nights were restless, her look wild and erratic, her head hot, her hands and feet cold as ice. Head-aches and nervous fits afflicted her ; and every month, towards the full moon, a severe attack of mental derangement.

I began the treatment of her on the 1st of September, 1821. For forty days I magnetised her regularly every morning, at eleven. The manipulation lasted thirty minutes ; yet during this whole period not a visible sign of action or reaction was to be observed. The fortieth day, however, scarcely had I finished the third stroke, when she fell on a sudden asleep, and so fast asleep, that when I finished the operation I left her to the care of her eldest sister, and found her still asleep two hours after.

The next day a similar occurrence. The third day the sleep had already passed into somnambulism.

In this state she lost the use of her arms and legs, yea, the whole body presented the appearance of catalepsy, with the exception of her head. The countenance presented again the traces of serene beauty. Her voice was more sonorous, her language more choice, than usual. I asked her whether she saw any thing in the room, and she answered she saw every thing in a beautiful light. I caused her eyes to be bound with a double silk shawl, and repeated my question. " I see every thing," answered she. I made then several trials, presenting different objects to her plexus, and she distinguished the most minute objects and movements. Colours she distinguished into light and dark. " In three weeks," said she, " I shall be well ; but before that time I shall suffer much. The magnetism is now concentrated in me ; I am like a cloud full of electricity. This evening, at seven o'clock, I shall have a violent nervous attack. You must be with me, and give me plenty of water ; three bottles at least. I must have every day seven bottles of water, and the last week nine bottles every day, but well magnetised. To-morrow I shall see more clearly ; but I will have no sick people around me. I cannot see their diseases, and it would pain me to see their disappointment." In the evening she had gone to see a friend, where I went to watch her. Scarcely had the clock struck seven, than she uttered a shriek, and fell to the ground. She lay there as if dead for some minutes, then started up, and whilst I was approaching her to take her by the hand, I received a shock similar to that of a torpedo, and my arm felt the pain of it for several days. She threw herself, half exhausted, upon a sofa. I began then to offer her some water, and in less than an hour and a half she drank the three bottles. She did all this in a kind of half-sleep.

The *clear sight* increased daily. The seventh day she could distinguish every colour. Red caused convulsions ; violet pleased her very much. On that day I discovered by accident the immense power of sympathy which existed between her and me. On entering her room I felt a slight attack of the tooth-ache. After having performed a few manipulations, she complained also of tooth-ache. I made then the following experiments :—after having bound her eyes, I put some salt in my mouth ; she immediately said, " O, how nasty ! " I then masticated some pepper, and she became uneasy, and

said, " O fie ; that burns my palate." I pinched violently my finger, she exclaimed, " Be not so childish to torment me ; I have some important matters to communicate to you." Whilst she was thus addressing me, Mr. R. came into the room ; she, however, continued : " The rector has spoken the most horrible things of you. He said you had made a compact with the Devil, and endeavoured to persuade a member of the Government to have you sent away."

" Pray," said the gentleman who had just entered the room, " at what hour, and in what place did the rector hold this conversation ? " I repeated to her this question. " Twenty minutes ago, in the room of the castle, which has a lobby. Both he and the gentleman were looking towards the town," answered the lady.

I observed that the gentleman who had put these questions betrayed great uneasiness, and guessing that he might perhaps be the person whom the rector had endeavoured to bias against me, " Miss," said I, " did you recognise the member of government ? " " To be sure I did—it was L. R." " By my honour," said the Governor, " it is all true that Miss J. has said ; but I must confess to you, also, that if my principles were less philosophical, I might be inclined to find in this very circumstance a justification of the rector's opinions."

The thirteenth day Miss J. repeated her prediction, that in a week her disease would be at an end, the next day the menstruation would be restored ; but the whole week she had much to endure, particularly the last three days. Upon my enquiry what she would have to endure, she replied, " I shall be like a dead body, without eating ; you must be with me, but must not speak a word to me ; only my sister, my brother, you, and my sister-in-law, must enter the room."

And all happened as she had said. The next day, and the three following days, she had several nervous attacks ; indeed, sometimes she was in a state of madness. The fifth day she lay stretched in her bed, dressed, in a state of total insensibility. Every one in the house thought her lost. Some of her relations were already threatening the Alpine Philosopher with legal proceedings. He, full of confidence, watched, alternately with the brother and sister, his patient. The seventh day, at seven o'clock in the evening, a kind of phosphorescent light, or electrical vapour, darted from the fair sufferer. The two attending ladies fell in hysteric fits. Miss J. rose from the bed, and sunk in her brother's arms. Thus she recovered her health, which she enjoyed for many years.

Behold a somnambulist—a real somnambulist ! and yet how different from that mentioned in my former letter ! And what makes the difference more surprising is, that Miss J., in her ordinary walk of life, was a real female doctor. She had read books of medicine ; she knew botany ; and was continually making up family nostrums, to distribute among the poor. Yet in her somnambulism she would have nothing to do with the sick !

But for to-day I must leave the somnambulists at rest, and turn myself to my readers, many of whom have already honoured the Alpine Philosopher with their enquiries. Some have enquired how the operation is to be performed ; whether with a particular instrument, or

with the hand only? whether upon the whole body, or upon some part only? whether when dressed, or otherwise? Others have also desired to know whether tellurism proscribes all sorts of medicines, or not; and whether there be any sign to know whether the cure be accomplished.

The operation is generally performed with the hands only, which are moved, according to the rules of tellurism, in particular directions, from the head to the extremities, resting now and then on the different plexus, or, in case of local disease, on the affected part. The manipulations are of two kinds, positive and negative—exciting and calming; some more or less so.

The tellurist is directed therein by the nature of the disease, and by the symptoms, which manifest themselves in many forms. Many of these movements are founded upon physiological principles; others have been discovered by somnambulists: and a few are merely traditional.

The principle, however, that directs the whole is the law of bipolarity, which employs the positive agencies to call forth the telluric life. Even here, as in every other science, all depends on the talents, genius, good-will, perseverance, presence of mind, and discrimination of the professor.

It is sometimes necessary to strengthen or to modify the manipulations with the aid of rooms properly fitted up with music, perfumes, flowers, plants, telluric baths, &c.

One of the most powerful auxiliaries is the baquet, or telluric battery. The baquets are vessels variously constructed, filled with different metals and magnetised water, with conductors, and other arrangements. Mesmer was the first to introduce a baquet; but, in his time natural philosophy was in its infancy; the discoveries of Volta, Galvani, Ritter, Davy, Berzelius, being all posterior to his invention, his baquet was very imperfect.

Dr. Wolfart, in Berlin, has improved upon the plan of his master, and Professor Kieser, in Jena, has improved upon that of Wolfart. The Alpine Philosopher, turning to the advantage of the science the recent discoveries of Faraday, has invented a new baquet, which must excel the baquets of Wolfart and Kieser. The batteries are of the greatest use, both to prepare for the human manipulation, and to perfect the cure of those local diseases which require more time than a tellurist can devote to his patients; they are also useful in cases of any accident that might befall the tellurist.

The treatment itself is not alarming, and possesses nothing contrary to decency. If the patient is confined, the manipulation is made over the bed-clothes, otherwise he may be seated in his usual dress. One thing, however, must be observed by the ladies, namely, to lay aside their stays whilst they undergo their treatment. This invention of a corrupted taste, this Procrustes'-bed of fashion, we shall have an opportunity of exposing upon some future occasion.

Tellurism, being founded on Nature, does not proscribe the use of medicine altogether; it proscribes only its abuses, and it demands from its patients to abstain from allowing any anti-telluric doctor to interfere with the cure.

Sometimes a proper course of medicine and diet is necessary to prepare for the magnetic treatment; sometimes a bitter medicine is required to assist its operation. In certain cases a little physic is required to make the cure perfect; but the quality and quantity of the medicine presented by the tellurist differ as much from those used by the Jatrochemist as Nature differs from corrupted art.

Without following exactly the system of Hahnemann, the practice of the tellurist is, in some respects, similar to his. Simple, pure drugs, mostly taken from the vegetable kingdom, rather intended to develop than to repress the symptoms of the disease, small but repeated doses, and a regimen always strictly suited to the individuality of the patient, are the rules followed by the tellurist in his medical department.

In regard to the time in which the treatment is to be left off, the tellurist has a scientific criterion, which in most cases is infallible, namely, the ceasing of the visible effects of the treatment. It is mainly a peculiarity of tellurism, that, after the cure is finished, the effects produced upon the patient during the cure, such as drowsiness, sleep, convulsive movements of the eyelids, disappear gradually in geometrical progression, as soon as the cure is finished.

Having thus answered the general questions, I beg to inform my readers that, if any of them desire to have private consultations, they will find the tellurist at home every day from one till two p. m., at 36, Castle-street-East, Oxford-market, where letters (post paid) may be addressed. THE ALPINE PHILOSOPHER.

THEORY AND PRACTICE, on, FAITH AND WORKS.

The following is extracted from Sir Thomas More's *Utopia*, and may be regarded as his private thoughts respecting toleration on matters of opinion:—

“At the first construction of their government, Utopus having understood that, before his coming among them, the old inhabitants had been engaged in great quarrels concerning religion, by which they were so broken among themselves that he found it an easy thing to conquer them, since they did not unite their forces against him, but every different party in religion fought by themselves. Upon that, after he had subdued them, he made a law that every man might be of what religion he pleased, and might endeavour to draw others to it by the force of argument, and by amicable and modest ways, but without bitterness against those of other opinions; but that he ought to use no other force but that of persuasion, and was neither to mix reproaches nor violence with it; and such as did otherwise were to be condemned to banishment or slavery.” “He seemed to doubt whether those different forms of religion might not all come from God, who might inspire men differently, he being possibly pleased with a variety in it; and so he thought it was a very indecent and foolish thing to frighten and threaten other men to believe any thing, because it seemed true to him, &c.”

Contrast the above with the following paragraph from Hume's *History of England*:—

“Sir Thomas More, who succeeded Wolsey as chan-

cellor, is at once an object deserving our compassion, and an instance of the usual progress of men's sentiments during that age. This man, whose elegant genius and familiar acquaintance with the noble spirit of antiquity had given him very enlarged sentiments, and who had, in his early years, advanced principles which, even at present, would be deemed somewhat too free, had, in the course of events, become so irritated by polemics, and thrown into such a superstitious attachment to the ancient faith, that few inquisitors have been guilty of greater violence in the prosecution of heresy. Though adorned with the gentlest manners, as well as the purest integrity, he carried to the utmost height his aversion to heterodoxy; and James Bainham in particular, a gentleman of the Temple, experienced from him the greatest severity. Bainham, accused of favouring the new (Protestant) opinions, was carried to More's house, and having refused to discover his accomplices, the chancellor ordered him to be whipped in his presence, and afterwards sent him to the Tower, where he himself saw him put to the torture. The unhappy gentleman, overcome by all these severities, abjured his opinions; but feeling afterwards the deepest conviction for his apostacy, he openly returned to his former tenets, and even courted the crown of martyrdom. He was condemned as an obstinate and relapsed heretic, and was burned in Smithfield."

More himself was afterwards beheaded for denying the king's supremacy, and much public sympathy has been expressed for his fate; but was Nature not justly avenged in his death of the crimes which had been committed through his agency?

TO THE EDITOR OF THE SHEPHERD.

FRIEND,—As you have liberally opened the pages of the *Shepherd* to the seekers of truth and information, I take the liberty of sending you a trifle on faith, from the private circulation of the late Henry Constantine Jennings, the antiquarian. There are a great many modes of faith and opinions at this present time; let us have the positive and negative on all sides of the question. I am in hopes you and the world may glean some edification thereby; and if they please, you shall have another trifle that will be an auxiliary to these articles.—Your old friend, *Wm. Bourne had of this date not J. S.*

THE ARTICLES OF RATIONAL FAITH.

1. That nothing can be more clearly manifest than the existence of the Deity, since both that and his consummate excellence are every day loudly asserted by ceaseless miracles, in the wondrous accuracy and infinite variety of his works.

2. That the unvarying identity of the different species, and the infallibility of their respective instincts, permanently deride the wretched doctrine of chance; and in concurrence with the unerring progress of the amazing planetary system, unequivocally proclaim his love of rectitude.

3. That the immensity and permanency of the whole creation forcibly prove the omnipotence, and naturally involve the incorruptibility, of its divine author.

4. That as every article of it, excepting man, is apparently subjected to unerring laws, each seems to suffice to its allotted functions, and the whole to have finally received its destination.

5. That all supernatural instruction or agency, as relative to human transactions, involve partiality, and therefore cannot consist with an independent being, who must of necessity be just.

6. That the idea of omnipotence is inseparable from that of unity.

7. That we can know of God only what is manifest in his works, for that the contemplation of infinite and eternal, exceeds the power of limited faculties.

8. That yet such of his attributes as merely relate to us, that is, to our moral duties, are clearly deducible from his works, and from the unerring laws eternally imposed upon the animal, the vegetable, and the elementary creation.

9. That man only, of the whole, being endowed with reason, is, by that sole faculty, exclusively invested with the means of acquiring merit, which can consist only in the free decision and steady execution of what is laudable, in opposition to the very best actions of impulsive instinct, which though dirigible by the reason of others, yet evidently preclude all natural choice.

10. That as probation, therefore, seems to be the chief object of this distinguished faculty, the future reward of its laudable exertions is but consistent with that just Deity who has imposed the trial.

11. That to repine at the frailty of human nature, or at the accidents that await us, even from our birth, is unjust, since the very essence of probation involves the alluring influence of the passions under the sole direction of reason, which must imply free-will, in manifest opposition to mere brutal instinct; for without the existence of worldly evil, and strong temptations to error, there could have been no merit in moral rectitude.*

12. That though the human intellect is subject to prejudice and to disparity of cultivation, yet the aggregate result of knowledge and experience being open to all, it is the duty of all to enquire.

13. That, as local mysteries and tenets are merely accidental, [See Article 2.—Ed.] and by consequence, discordant, they cannot be productive of any general rule of conduct, since none can justly supersede the other.

14. But that reason being every way the same, if we argue from eternal and unalterable principles, which are likewise universal, such doctrines being every where equally demonstrable, need but the pure cultivation of integrity to be universally adopted.

15. That as they fairly promise future rewards to the votaries of benevolence and fortitude, which virtues, under their different modifications, include every moral and social duty, there is just reason to conclude they would be universally beneficial.

16. That the chief objects of probation depend on virtuous action or steady forbearance, as either may respectively conduce to civil benefit, for they are then manifestly laudable. That of rational faith, to conciliate and excite those duties, and to confirm our perseverance in them; and though private confidence is meritorious, blind acquiescence in what shocks our reason is an impious prostitution of that divine faculty.

H. C. JENNINGS.

P. S. Had I not unequivocally written what has oc-

* Conscience, if more strong, would act like instinct, and consequently preclude all merit. Now, the difference between instinct and reason is this: Instinct never draws the least inference. No instance proves brutes making anything particularly beneficial to themselves, even in case of security, luxury, or preservation, further than the law of instinct; and they possess no compassion further than their young ones are reared up, or memory further than they are interested.

curred to me upon such an important subject, I had acted inconsistently with my own principles; for I have ever freely censured those who, instead of personally and explicitly committing to the world any valuable rule or inference that their application had been rewarded with, and that they might deem interesting to mankind, have been cautiously contented with the bare mention of their discovery. The negligence of the wise and virtuous Socrates, in this respect, is to be regretted. Even Mr. Locke, whom it is almost heresy to blame, had, I think, acted more consistently if, in lieu of leaving it to posterity, he had candidly risked his solution of that intricate problem concerning spirit. H. C. J.

THE DOCTRINE OF THE "WOMAN."

MANY enquire what is our purpose in bringing forward the doctrine of Joanna Southcott, and ask, rather sneeringly, what we can make of it. Yet such people pretend to be *universalists*! Universalists! and yet cast anything out of the plan of the universe! We shall leave these people for a season to recover their senses, and go on.

The progress of all Nature is towards universalism, not the universalism of the little old-fashioned Christian sect long known in Britain by that name, who are only universalists in denying the doctrine of eternal punishment; but universalism in the widest and most comprehensive meaning of which the word is capable; universalism which maintains a system of Nature, of which every institution, small or great, forms an essential and predestinated part.

In running down the stream of progress, therefore, it is our duty always to examine the latest movements. The two streams of faith and infidelity flow upon two very different soils, but they will meet at last in the great ocean of truth.

St. Simonism is one of the last, if not the last, move in the line of faith on the continent, and many beautiful doctrinal truths it has brought forth; but it attempted to practise before it was ripe. It was defective, and it was sensible of its defect; it wanted the feminine principle; hence it for ever spoke of the free woman and her doctrine, and looked and longed for her appearance; it is now scattered, but not lost; the spirit is yet alive.

Owenism is the last move in the opposite department in England, and it also has taught many splendid moral and political truths; but its followers have not analysed the progress of Nature, and therefore they look for nothing but statistical co-operation and infidelity, expecting to get rid of old religion by letting it alone. Whether they can accomplish this or not, time will declare, but this is their object; hence, they oppose religion only by maintaining that man is the creature of circumstances, and believes or disbelieves according to the circumstances of birth, education, &c.; which is all true enough; but this does not show how they are to get rid of the circumstances which create belief.

Now, how does it happen that these two parties are respectively placed as they are—the spiritual eastward, and the material westward, in England? Our science of Nature explains it at once. We have often said that the spiritual is the male, the material the female department; that the progress is from male to female, and

from east to west; that England is the end of the line of progress; hence, the two great centres of the movement are first France, second England; and the two great systems of political regeneration in both have been characterised—the first by a spiritual, or doctrinal and scientific; the second by a material, or moral and statistic character. We are not so silly as to discuss the question "which of the two is best?" they are both best, and have been useful in their place; but there is more to come.

St. Simonism is a kind of scientific faith, which it attains by an analysis of Nature. Owenism is an artificial morality, which it accomplishes by removing the political causes of crime. But these two do not meet the wants of mankind; the trinity is not yet complete; the revelations of the yet unpounded mysteries of Nature demand also a share of our consideration; and he who denies it must just wait till he come to his senses; he will suffer defeat after defeat till he makes concession or the grave receives him.

That other department is what is generally esteemed the lowest by some, and the highest by others; but modern philosophy has already ranked it at the bottom of the scale of intellect. Being so, who more fitted to represent it than that sex which has been degraded to the servitude of the male, and whose nature is as little understood as theology itself; that sex, whose nature is a mystery, and capable, like religion, of descending to the lowest and rising to the highest rank of morality and refinement. *Dependence* has hitherto been the character of woman—"thy desire shall be unto thy husband, and he shall rule over thee." Now, what department of thought or action is more dependent than old religion? it is the very grave of originality and self-direction; it teaches us to submit all our ways to a mystery, to cast off our own wisdom, and subject our reason to the dictation of a vision, a dream, or a miracle: who more suited to represent this department than woman, the subject of man?

Now, we ask those who impugn our sagacity, what other woman in the world they can adduce as representative of this department of Nature but the one we have selected? Who was it that, at the commencement of this century, astonished all Europe with her singular pretensions, her denunciations of wrath upon the kings, and legislators, and priests of the old world, and foretold the regeneration of the earth and mankind, under a better and a perfect system of divine government? Who was it that foretold and demonstrated from the Jewish and Christian scriptures, in a manner that had never before suggested itself to our all-wise and all-learned theologians, that Jesus Christ was only the *first*, and that a *second* deliverer must come to complete the work that his Father had begun.

Then palaces shall rise, The joyful Son
Shall finish what his short-lived Sire began.

Who was it that told them that the mystery of revelation must close with a woman, as creation closed with a woman; that the feminine nature was the last in the line of progression, and that from it arose the new nature, the second birth? *One woman only*. No man can point out another. What that woman individually thought we care not. She knew nothing; but her writings most distinctly declare, that the son she was to bear was a spiritual son. The Spirit says, "Let no man vainly imagine that this child-birth means *temporality*. I tell you all it means *spiritually*; and know all men, through this child-birth the woman shall be freed from the transgression of the fall." She was deluded into a false conceit, like all other

such characters, that it was to be a real child; but she was a fool, and so were all those who followed her. Her child is Universalism, New Christianity—not a man, but a doctrine or system—a spirit—Christianity born again, and of the woman born.

Nor is she, or her church, the only bride. Materialism is also a bride in its own department, and claims the very same deliverance for woman that Joanna claimed for her sex: only materialism claims it from the laws of man, as a matter of right. Joanna, in the spirit of the system to which she belonged, claimed it from God against the Devil, and her followers keep up the same practice, not considering that God and the Devil are both in the laws of the land. Were the two parties to join their clamours they would strengthen one another; but at present they rail at each other, and the Devil laughs at them both.

Materialism is the feminine Nature, as we have already demonstrated; and here we find the two brides in England, alone. The two brides? What is the meaning of this? Those who are acquainted with the science of mysticism know this well enough; others know no more of it than an oyster; they are the bond-woman and the free; but of this hereafter.

CORRESPONDENTS.

A. D. complains of our partiality to Moses; but he does not state in what our partiality consists. Is he sorry that we prefer the Pentateuch of Moses to the Shasters of the Hindoos? Then we are sorry for him. His letter, upon the whole, is very gentlemanly, compared to many which we receive, and deserves a respectful answer; but there are some points on which he has grievously wronged and misrepresented us. He says that, according to our own showing, Moses was a literary plunderer, and that the whole book of Leviticus was stolen from the Vedas of the Hindoos! Really, this is too bad. He ought to have quoted chapter and verse. We have often affirmed that the elements of the Jewish and Christian religion were in the world before the epoch of their institution; but we never accused Moses of transcribing other writings; and yet it is very probable that he took his cosmogony from ancient records. We analyse the progress of Nature, and it matters very little to us whether Moses be an original or not; that does not modify in the slightest degree the question of the divinity of his religion, which does not depend upon ancient testimony, miracle, or tradition, for its authority, but upon the matter-of-fact unquestionable circumstance of its having prevailed over every other religion, and run down the stream of intellectual progression to the present day, where it has enthroned itself in its legitimate successor, Christianity, as the *ARCH RELIGION* of the old world, and therefore the representative of the god of this world. No man in his senses can dispute this fact, and we ask nothing but acknowledged facts to proceed upon. We don't rest upon fables and conjectures, like the infidels, and their pious counterparts, the priests. What A. D. has written respecting the Mosaic history is much more reasonable than his 'theory.' We quote his own words:

"But your friend Moses's account seems a little extraordinary: according to the Hebrew chronology, the whole world, with the exception of eight human beings, was drowned by a rain which lasted three hundred and seventy-seven days; in a hundred years after, Noah and his offspring built the famous Tower of Babel, and I dare say the city walls were one of the wonders of the world. Now the whole population of the earth at this period could not have been more than fourteen hundred, and there must have been no sterility among the ladies,

nor want of vigour amongst the gentlemen, to produce that number. Yet off goes one party to found an empire in China, another to found a kingdom in Egypt, &c. Two hundred and sixty-seven years after, Abraham leaves the kingdom of Babylon, to Canaan, from thence to Egypt, where he finds a king and court, and a flourishing nation, with a numerous population, and the granary of the world. Surely there must have been a little necromancy in all this rapid increase of population, and discovery of the arts and sciences. Talk about the ignorance of the ancients; their achievements were a succession of miracles."

The truth or falsehood of local histories and traditions we care little about, and we think A. D. is wasting his thoughts upon details and trifles which would be much better applied to more general subjects. What would he gain were he to prove the historical Bible a lie, even suppose it were possible? Nothing. We should puzzle his wits even then, and keep up the *Shepherd* with as much spirit as ever. It is the divinity of Nature we contend for—the divinity of error as well as of truth. All is from the self-same omniscient mind, who employs *error* to train humanity to the model of his own benevolent intentions; and we defy any man to show that truth could ever be attained without coming through the intellectual and moral furnace of error. *Error* is the school of the human mind; *truth* is the completion of human education. An infidelity that opposes old religion is wisdom and virtue; but one that denies a systematic plan in the progression and general training of humanity is the excess of apostasy from right reason. When an anatomist dissects an animal, and finds an organ of which he does not understand the use, he never suspects that it is useless; he invariably says to himself, "What is the design of this?" This is wisdom. Then why not follow it in dissecting more general and extensive organisations of nature? Reasoning from small to great, we ought certainly to conclude that the same systematic plan prevails throughout all nature. But infidels, and indeed all believers, reduce all to chaos. They are all alike, and perfectly unintelligible either to themselves or others.

If A. D. reads more, he may probably find that the kingdoms and kings of those days were much more insignificant than he imagines; for Abraham with his own servants, three hundred and eighteen men, attacked four of those kings, and defeated them. A kingdom in those days was only a large farm. Moreover, the Septuagint Bible makes 1,257 years between Abraham and the flood. It was common enough for the Jews to omit generations in their genealogical lists, and thus, contrary to all other nations, to shorten, instead of lengthen, the times that are past; but it is evident they had no other object in view but saving trouble; and after all they are the most rational and consistent of all ancient historians and chronologists.

Mr. Malby next week.

A LECTURE upon Tellurism, or Animal Magnetism, by THE ALPINE PHILOSOPHER, at the request of the "Society for the Acquisition of Useful Knowledge," on Tuesday evening, March 10, at Eight o'clock, at 36, Castle-street East, Oxford Market.—Admittance Free.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

The Shepherd.

No. 29.]

SATURDAY, MARCH 14, 1835.

[Price 1d.]

SYSTEM OF NATURE.

THOSE who have carefully followed us from the beginning must long ere this have thoroughly understood that our universalism includes all things—the past, the present, and the future. And, indeed, an ordinary share of what is usually called common sense might be expected to teach this at first, without the trouble of definitions and explanations. But so grossly perverted have the people's minds become by the exclusive views and philosophical absurdities, of fidelity on the one hand, and infidelity on the other, that the eyes of the human understanding at this moment distort, discolour, and misrepresent every idea of a System of Nature.

How is it possible that there can be a System of Nature if it is all or in part accidental? Yet there is no public teacher, no author, dead or living, who ever had any other idea of a System of Nature, but that of a system of chance or chaos. We know that many pretend otherwise: the Calvinists profess the doctrine of predestination; but if you merely put them to the test, by asking if Mahomet was the servant and prophet of the Lord, they are non-plused immediately. Mirabeau writes a System of Nature, as he calls it; but he neither saw, nor professed to see, any system or method in the progress of society: for the principal object he had in view was to show that there was none. Priests and believers profess to believe in prophecies; prophecies also of corruption of every species. But in this corruption God has no hand; it is all an accident, which occurs or not occurs by the free-will of a being whose power is not considered equal to the consummation of the plan which he himself has invented for human destruction. Thus the Devil's plan is counter-acted by God, and God is guided by the circumstance of the Devil's free-agency; and so, what with one plan, and what with another, all opposing and defeating each other, there is evidently nothing but chaos after all. All the doctrines of the old world are atheistic, because they all involve the idea of the action of a power which is not God. To conceive such an absurdity is sufficient to extinguish rationality; and it is because men have actually reasoned upon this supposition that they are all irrational. Nothing is more common than to hear men say they don't believe in a God, but they believe in a power! By which they mean a dead power! A power which acts, but does not know it. This is the God of the atheist; this is the Nature of the deist and the Christian. All believe in this dead power! To reason with men who have the folly to support such an idea is almost hopeless; and we should marvel greatly how it could have been harboured one in-

stant in a human mind, did we not know that the System of Nature teaches us the necessity of man being brought through the thickest clouds of absurdity and ignorance before he arrives at simple truth. The whole world lies in this darkness; not a single sect or party forms an exception; and this is a beautiful illustration of that great and sublime truth, that the God of this world is the PRINCE OF DARKNESS—the prince of intellectual and moral darkness. Yet even the professed reformers of the day, so far from leading men out of this intellectual gloom, are going deeper and deeper into it. Atheism is merely the last move of old theology; it is merely the Nature of the old theologian, without his God. It is curious that our philosophical magi of modern times don't see this glaring fact.

The past philosophy is all the system of DEATH. It is to the system of universal LIFE that we propose to lead those who are willing to follow.

Were we to judge of the final importance of any natural production by its first appearance on the sphere of existence, we should form a very erroneous notion of its rank in the scale of being. We should despise an acorn as a thing of no value; the little dark spot in a putrifying egg, would be still more contemptible. Yet that acorn becomes an oak; the dark spot in the egg, the heart of a chicken, from which comes forth the wonderful fabric of an animated being. It is not upon the principle involved in these simple facts that those men reason, who say that it is absurd to attach so much importance to the opinions and mythologies of a petty nation inhabiting the borders of the Dead Sea; a tract of land so small as to be overlooked by the ancients, or blended with the surrounding empires of Syria and Asia Minor; that a cattle-dealer and shepherd of the name of Abraham should be a person of such importance, that his faith and his family pretensions should precede those of any other individual of those ancient times. But what say these objectors to the fact, that *so it is*; that that little seed has continued amid the revolutions of empires to grow and overspread the world with its fruit? "*So it is*;" this is all that requires to be said upon the subject, to overturn the objection of these petty philosophers. And amid all the reformatations and revolutions of thought and opinion, this despised, this contemptible mythology, has superseded every other, by swallowing them up, as the rod of Aaron, its representative, did before it.

We often hear and read the stale idea that has pervaded the whole soul of the modern, but now dying, system of French materialism, an idea that forms the essence of a popular work called "Volney's Ruins of Empires;"

that system after system has been reared in succession, and system after system died and disappeared; consequently, judging from the past, in our anticipations of the future, we may reasonably infer that that which is now accounted inviolable and everlasting truth will meet with the same fate as preceding creeds, which are now swallowed up in everlasting oblivion. Those who reason so, have no idea of the science of progress; it seems never even to have flickered in the fancy of the eloquent author of the "Ruins of Empires:" his only idea was that of a succession of systems, which he has represented as rolling down, one after the other, like so many chimney-pots, which Ignorance, with his sooty face, has always taken care to replace with another. The statement is only partially correct; but the partiality of the statement is so unscientific and critically defective, that it fills the mind with a most erroneous idea of the "course of time."

It is not true that system after system has succeeded another in the lapse of ages; it is true that there were many famous systems of superstition and mythology, which are now swallowed up and for ever lost; but there is *one*, which, trace it as far back as you please, has been invariably progressing to this hour, and which will spread out its branches much wider than ever, and end in universalism at last. Our present Christianity is the lineal offspring of the religion of Abraham; it is at this moment spreading far and wide, even in its corrupt and illiberal sense, over the whole habitable world; and we have already sufficiently demonstrated that there is a still more liberal and universal sense to come, which will put to blush all the boasted liberalism and charity of any negative or rejective system.

Had Volney pointed out this manifest peculiarity in his "Ruins of Empires," it might have been a work for future generations to class amongst the gems of science; but, as it stands at present, it is a false and delusive outline, with much of the fancy and taste of the poet, but destitute of the accuracy of the draftsman and the painter.

When a seed is put into the ground, it first sends forth its radicle downwards to take root; it then sends forth its plumula upwards; these two polar germs are enclosed between the two lobes of the seed, which lobes decay as soon as they have served the purpose of bringing forth the germ; the germ continues to grow, and, by and by, the flower appears, and blossoms for a season; but as soon as the seed-vessel is impregnated, the blossom decays, and the fruit ripens in the genial heat of sunshine. Were a botanist, in giving a description of these successive decays of lobes and corollas, to omit the circumstance of the continued progression of the same individual plumula, which first ascended from the two lobes of the buried seed, and progressed upward till it terminated in the everlasting seed again, and merely tell you that first one lobe died, then another, then one leaf and another, then one flower and another, implying, at the same time, that there was no systematic connexion between these changes, and no specific end to be ultimately accomplished by all these successive revolutions, he would give you such another system of botany as Volney has of progress—a system without meaning, which would leave no idea of beauty, order, or arrangement in the mind, but incline

the young student to regard a plant as a sort of "*usus natura*," a species of monster, unintelligible in its movements, and useless in its purposes. But there is no such botany taught; men are reasonable beings when studying the minor organization of plants and animals; but when they begin to study the organization of universal man, and human society, then all their good sense immediately forsakes them; Chaos directs their thoughts. Hence, such refined and well-informed minds as the French infidels, and a few of the English, who are bringing up the rear of the dead march of materialism, imagine they are reasoning most conclusively and unanswerably, when they speak of system tumbling over system in endless succession; whilst they keep out of view the one religion of progress, which, like the spinal marrow, has run up the back-bone of Time, and is now forming the brain and intellectual system of the new world. They are trying to cut that spine, and form a brain without it. Even suppose they could, what a monster they would make—a sort of cephalopode, with feet on its head (if feet it could get), and neither back nor belly.

The Jewish church is the seed-vessel of humanity. There all the anthers and stamina of other systems shower their fertilizing dust, then wither and drop; but within it is contained the germ of another system, which will yet cover the habitable globe, and realize the reasonable prospects of those who look for God's kingdom upon earth. Fruit is not good until it be ripe. It is always bitter before it is sweet; green, unsightly, and unshapely in its infancy. And it can only be in the puberty of society, when the manhood of human intellect is come to its prime, that any institution, however divine or miraculous in its origin, can respond to the wishes of a virtuous and enlightened mind. That puberty is approaching, by the rapid progression of science and art, by the aid of which mankind become fellow labourers with God in renewing the face of nature, and bringing into being the new creation. Revelation and mystery keep pace with this progression in a state of hostility, and foreshow the same happy results, by the sole intervention of miracle and prophecy, which the other anticipates independent of either; both are blind to the final result, which is the co-operation of the great powers of intellectual and spiritual nature in such a manner as to sanctify both extremes as indispensable in the great economy of the social frame—the one for revealing the mysteries of external nature, and the other for unveiling the secrets of the human mind, its prospects, and its connexion with the universal spirit.

THE SHEPHERD.

FRAGMENTS.

Est Deus in nobis.

God is within our own bosom.

EVERY thing in nature has something of divine, either concealed or manifest; even the criminal and the profligate preserve continually something of the Eternal Spirit, which moves them after perfection. Most probably, no

one seeks after that which he fancies to find, nor strives he to obtain that which he pretends to seek. Most assuredly we all seek, though unconsciously, the same object.

It is particularly in the solitary recesses of nature, or when the dazzling centre of our planetary system is removed from our sight, or when a heart dear to our heart has ceased to beat, that the God who dwells within our own bosom reveals himself, even to those whom the toils and passions, false systems, and broils of daily life, have deprived of the consciousness of its existence.

The human being who thus, for the first time, becomes conscious that there is a God, is like unto him who, born blind, is by some happy accident suddenly restored to sight. The world is for him a new creation; he beholds a new heaven and a new earth. That which before appeared dark, lifeless, and discordant, he sees glittering in various colours, full of life and heavenly harmony.

There is another way to restore the sight to those who, in their blindness, do not perceive God, besides the solitude of nature, the glory of the night, unveiling the wonders of myriads of stars, or the pangs and woes of a heart which mourns upon the death of a beloved being—it is through the wonders of art, particularly through the medium of music, and its twin sister, poetry.

Not as if music and poetry were always, and under all forms, the revealers of God. I speak of that true, genuine art, that comes from the heart and from the inmost recesses of our souls, imparting a radiant life to all around it. We have often lamented how the journals were doomed to give publicity to the productions of unwinged mocking-birds. To-day we rejoice in introducing to our readers a young poet, who happily has entered upon the right way to become a true poet; that is, one to whom poesy appears as the eternal allegory of God in Nature.

THE ALPINE PHILOSOPHER.

REFLECTIONS ON A CHANGE FROM DAY TO NIGHT.

Now night drew on; 'twas dark, and the gay stars,
Watching the flowers as they fell asleep,
Were bright above me. They were beautiful,
And in their soft revealings seem'd to say,
"Death is but in the dying." This I felt;
And the first break of silence was a burst
Of tearful ecstasy.

What had I seen? The sun of day go down;
The red horizon deepen into dark,
And its life-working influence pass away;
And yet, no death around me: rather life,
Reveal'd in a sweet contrast, beautiful
As was the mid-day life. The accustom'd air
Sparkled with splendour, while above me shone
Centres of systems in a single star
Convolved. "Great God of day and night," I said,
"How wondrous are thy ways! Lo! Nature's half
Entranced in sleep, while on a slumbering world
A thousand living things are looking down."

Thus said I, or thus felt I; for the soul's voice
Spoke it within me, and with accent soft,
Attuned by Nature in her sympathy.

I stood awhile—unutterable thoughts,
Made up of feeling most, and wonderment,
Pass'd to and fro; when like a flash it cross'd,
That what we see in dying is no more
Than the mysterious mother of new life;
That life and death, and light and dark are one;
That all is one, and that the multitude
Of varied life is but a unity
Made so by a wise Maker.—FRANK JOHNSON.

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER XI.

"Qui novit rebus, sive rerum mixturis celum propitium solemque infundere, mirabilia prestare potest atque hinc omnis magia operatio pendet."—MAXWELL, *Med. magis*. Aph. xxiv.

He who knows how to infuse into bodies or their elements the favourable powers of heaven and of the sun, can alone perform wonderful cures; and from this alone depend all the operations of tellurism.

It was my intention to present my readers with some instances of that wonderful phenomenon produced by tellurism, called artificial somnambulism; I chose facts which occurred to me during my practice, because I could vouch for their truth. I shall, however, upon a future occasion, publish some still more astonishing occurrences, taken from the works of Wolfart, Kieser, Klein, and from the annals of Nasse, Eschenmayer, and other philosophers.

But there are facts still more important for the science; namely, those which show how the telluric operation acts as a sure remedy, producing those critical changes by which the health is restored, without bringing the patient into the state of ecstasy, and which has been the subject of so many contentions.

The telluric agency is a sure remedy in all nervous affections and mental derangements; in all complaints depending on the disorders of the vegetative, generative, and reproductive system. It is equally powerful against all scrofulous disorders, and diseases depending on them, as lameness, and loss of sight, speech, or hearing; most of the diseases of women and children are consequently under its influence. If the telluric agency does not always remove these evils, it is only because the disease has been rendered incurable by previous ill-treatment, or because the nervous affection is not idiopathic—that is, original—but sympathetic, depending on some organic defect.

Several forms of mental diseases, epilepsy, palsy, and diseases of the eye and ear, are not nervous, but affect the nerves by sympathy.

Tellurism cannot cure a malformation of the skull, of the heart, or of the lungs; nor can it reproduce any organ that has suffered from decay, or has been destroyed in any other way. But it can impart new vigour to the functions of the different systems; it can remove obstructions resistant to all other external and internal remedies; it can restore the natural secretions, and bring back the energy of the vital power. Marcus, the director of the Bavarian faculty of medicine in Bamberg, tried several

telluric experiments against rheumatic affections with the greatest success; the convulsive cough was also treated by the same eminent physician with equal success, after all other pharmaceutical prescriptions had failed. (*Ephemeren der Practischen Heilkunde*, 1811.)

The amaurosis was perfectly cured by tellurism. (HUFELAND, *Journal der Practischen Heilkunde*, Band. 29, H. 2.

Examples of cured epilepsies, hemorrhages, and all kinds of uterinal affections, are recorded in Wolfart's *Asklapeion*, and in his new *Asklapeion*, a journal published at Berlin, 1812—16.

The scrofula, in its many forms, was cured in St. Petersburg, in Bremen, in Stuttgart, and in Carlsruhe, by Nordhof, Weinholt, Nick, and Klein. All forms of nervous affections, and nervous mental derangements, have been radically cured by the same remedy. (See Dr. and Professor BAHRENS *der Animalische Magnetismus und die durch ihn bewirkte*. Churen, 1816. Dr. and Professor WILBRAND, *Darstellung des thierschen Magnetismus*. Leipzig, 1824. ZIERMAN, *Geschichtliche Darstellung des thierschen Magnetismus*. Berlin, 1824. LEUPOLDT, *Seelen heilkunde, Heil Wissenschaft und Magnetism*. 1821. Dr. and Professor KIESER, *System der Heilkunde*. 2 vols. Leipzig, 1820. Dr. and Professor BURDACH, *Physiologie der Erfahrung*. 3 vols. Konigsberg, 1832.)

FACTS.

Tic Doloureux.—Count B. S., fifty-eight years of age, of sanguine, nervous constitution, a diplomatist and a man of letters, was spending his Christmas vacation with his family at his beautiful villa on the lake of Zurich. His happiness, however, was marred by a violent tic doloureux, the consequence of over-exertions in his political and literary pursuits. I was invited to spend the winter months in this chosen circle; and on my arrival, I found the man, who otherwise was accustomed to electrify with his wit and humour a whole society, in the most pitiable state of irritability and pain. I asked the Countess what was the matter, and she told me that Dr. H., a most able physician and surgeon, was expected in the afternoon to cut the nerve which caused such painful symptoms. "If the Count will allow me to try magnetism, I can spare him the torture of the operation," said I to the Countess. "But he is not a believer in it," answered she; "and I have been the butt of his witticisms as often as I ventured to enter upon the subject. Nevertheless, we will try at dinner-time if we can persuade him to allow you to operate." Several other ladies of the company agreed to turn the conversation at table upon magnetism, and to try to induce the Count to make trial of it.

The great diplomatist was conquered; after being assailed by the persuasion of his amiable lady and visitors, he resolved to submit to the experiment.

The first half-hour's calming treatment procured him relief; after a fortnight Count B. was so much improved that he began to acknowledge that it was an excellent remedy; the third week he was perfectly cured. No visible symptoms during the first fortnight, except now and then a contortion of the facial muscles, such as afflicts

the late Lord Chancellor. During the three nights before his final recovery he had an abundant, I may say a flowing, perspiration at the extremities. He has never been afflicted since.

Paralysis.—Mr. B., a colonel in a Swiss regiment, forty-seven years old, in the best general health, of sanguine, nervous constitution, married, and having five children, came to Chur to be cured, if possible, by tellurism, of a paralysis which deprived him almost of the use of his left arm, hand, and leg, and which began to touch even the right side. The disease had begun nine or ten years before, but the patient could not say whether it originated in a fall from his horse, or from sleeping upon the damp ground during a campaign. I began the trial, and, for sixty days, there was no remarkable visible sign, no sleep, no heaviness, no warmth, no shivering; except on the critical days, and, by certain winds, an increased movement of the affected part. The sixty-third day, however, he fell into a kind of epileptic fit, and fits, more or less violent, continued for twenty-seven days, after which a hemorrhoidal flux put an end to his disease. On his convalescence, he, for a month, made use of the battery, and was then perfectly recovered.

At the same time, I cured two boys and one girl, all three crippled in their arms. These cures required but a few weeks, the patients not having previously wasted their vital powers by violent remedies.

A uterinal complaint, with insanity, alternating with attacks of cutaneous disease, and nervous spasms.—Miss L., a young lady of twenty-five, of melancholy, nervous temperament and delicate constitution, had suffered from her fifteenth year a series of complicated evils, which had resisted the most heroic treatment of the cleverest physicians. Her first attack was a difficulty of menstruation, which was accompanied with spasms in the uterus, severe headaches, and melancholy. These symptoms disappeared under medical treatment, to give way to a cutaneous disease of the most nauseous nature, known under the name of Pemphigus. The whole of her body was literally covered with bladders filled with a watery, loathsome odour, accompanied with fever, vomiting, and swoons. As soon as the medical regimen had removed these eruptions, the nervous attacks, headache, and melancholy, returned with greater intensity. Thus her life, since that first-mentioned period, had been a continual succession of disease and misery; her family, at length, consented to try the power of tellurism.

When I began the treatment, Miss L. was labouring under a paroxysm of intense melancholy, spasms, headache, and nervous trembling. Her menses had been suppressed, her digestion impaired, her bowels bound. She had been bled, physicked, and successively treated with cajuput-oil, moschus, valerian, ether, and other stimulants; yea, even moxa and cauteries had been resorted to. Before commencing the telluric process, I began to act gently upon her bowels, and to prescribe a proper diet, thin broths and vegetable food. After having thus prepared my patient, I began the operation. I continued for a month to act principally upon the uterinal regions, and her melancholy slowly abated; but when some symptoms seemed to announce approaching menstrua-

tion, her melancholy changed into decided insanity, accompanied with nervous attacks, laughing and screaming fits, feverish visions, and ravings. During this period I continued to act upon her bowels with gentle cathartics, and magnetised most intensely her nervous system. At the end of the second month, she fell, for the first time, asleep under my manipulation; the menstruation took place in the regular way. After this epoch her sleep became more and more profound, her bowels regular, and her melancholy disappeared. From day to day she improved in her general health, and after three months and three days she had perfectly recovered.

Violent hæmicephalgia.—Miss H., aged 19, had suffered for three years in this painful disease. She was of sanguine, choleric temperament, and enjoyed, in all other respects, the best health. Her bowels, her menses, were perfectly regular, her appetite good, and nothing could have indicated illness. Every six weeks, however, she was subjected to the attacks of violent headaches, which continued for seven days, during which she could not rest, nor do any work whatever. She was obliged to keep lying down, and to have her head bound up, and fomented with vinegar and salt.

I began the operation whilst she laboured under this severe complaint, without producing any visible effect. I continued, however, my treatment for six weeks, when she began to complain of pains in her legs. I examined them, and observed that they were red and hot. After a few days her legs presented the symptoms of erysipelas. Upon questioning her mother, I discovered that, one year previous to the attacks of cephalgia, the young lady had had the erysipelas, which had been cured by external applications. I prescribed a proper diet, and some gentle opening medicines, and continued my treatment a week longer. She perspired three days and three nights most profusely; the erysipelas disappeared, and thus my patient was perfectly restored to health.

Here are facts enough to prove the efficacy of telluric treatment without the intervention of somnambulism. I have now under my care several patients, who will not fail to present similar results. Yet I must confess, that at present there are great difficulties to contend with. All who come to me are people who have endured for many years the ordeal of the most powerful medical agency. I have therefore not only to counteract the inroads of ill-health, but the effects of bad-management. I do not say this to disparage the medical profession in itself. There are many most excellent and skilful men in it; but they have been trained and tutored in a bad school—the school of the experimentalist and fact-monger. Their knowledge lacks the basis of a sound philosophy of nature. Their heads are too often mere walking repertoires, wanting the direction of leading principles. Their eyes look merely to that which strikes their senses, and their senses go astray for want of a regulating criterion. They attack the symptoms, and are unable to reach the causes.

In our next letter we shall present our readers with more facts, and shall endeavour to draw from these facts some leading principles. [We beg to remind the many enquirers who desire more particular information, that

our only disengaged time for consultation is between the hours of one and two each day, at 36, Castle-street East, Oxford Market.] THE ALPINE PHILOSOPHER.

CONVERSION TO THE CATHOLIC CHURCH of the Honourable and Reverend George Spencer, Brother of the late Lord Althorp, now Earl Spencer.

THE following letter was written to the Rev. N. Rigby, of Egton Bridge, and may be interesting to many of our readers, as well as useful in making them acquainted with movements in the world of faith, of which they never dream. The secret of such conversions lies in this, that the individual has been led to give the preference to the fundamental principle of the church he selects; and having done so, he foolishly regards the whole as immaculate, justifies all its errors, and covers it all with a halo of glory. The opposite party falls into the same madness. Be it our task to teach men moderation and sound analysis, in opposition to all the old practices of Catholics, Protestants, or Infidels.

DEAR AND REV. SIR,—I was ordained deacon in the Church of England about Christmas, 1822, being satisfied at the time that all was right in that church, although I had not taken much pains to study the grounds and principles of its establishment. When I entered upon active employment as a clergyman, I was naturally led to seek information more fully; I often used to read and admire the Church Liturgy; but often wondered how such a beautiful work could have been produced in the midst of such confusion and wickedness, as I learned from Protestant histories, had accompanied all the proceedings of the chief actors in the Reformation of England. I had been brought up in the habit of looking on the Catholic church as a mass of errors; and little did I think at that time that all that I admired in the Church of England Liturgy, was merely an inconsistent abridgment of the holy and admirable offices of the Roman Catholic church. What first led to an alteration of my views in regard to the soundness and excellence of the Church of England, was the intercourse which I had with various Dissenting Protestant ministers. I used to seek their conversation with the hope of leading back some of them and their flocks to the church, with which I was satisfied, and which I did not think they could have any good reason for leaving; but every sect with which I became acquainted seemed to have something apparently reasonable to say in behalf of their own views, and against the Established Church. I knew, of course, these sects could not be all right in their contradictory doctrines and rules of practices, and I clearly saw palpable errors in their several systems, but at the same time I learned from their conversation that I could not defend every part of my own system, and I also found that these ministers could bring arguments against it which I could not satisfactorily answer. At length, I found a difficulty regarding the thirty-nine articles which made me see that I could not rest as I was. In signing those articles, my assent was required to certain declarations of doctrines, expressly on the ground that they could be proved by most certain warrant of the Holy Scripture; and indeed Protestants hold it as a general principle, that the "Holy Scripture containeth all things necessary for salvation; so that whatsoever is not contained therein, nor may be proved thereby, is not to be required of any man that it should be believed as an article of faith, or be thought necessary as requisite for salvation." Now, with

the doctrines in question I found no fault ; but I could not draw a clear and satisfactory demonstration of them from the scriptures alone ; in order to establish them, I found myself obliged to have recourse to arguments from reason, independent of the scriptures, or to appeal to the general consent of Christians in successive ages, in other words, to the tradition of the church. I felt that I could not again sign the thirty-nine articles, unless this objection were removed. I proposed it to my superiors, but, as the explanation given by them did not satisfy me, after what I considered a sufficient pause, I declared finally my resolution of not signing them any more. I was now the more free to seek the truth where it might be found ; but I had then no idea that it was in the Church of Rome. My friends would have dissuaded me from having any communication with Roman Catholic priests, but I thought they ought not to be excluded from the general scheme of re-union which I wished to see set on foot, I used therefore to speak to them frequently. At first I expected to find them ignorant of true spiritual religion, mere formalists, and quite unable to defend what I thought the absurdities of their creed ; but, to my surprise, every conversation with them led me to see that I had been deceived ; I found that they both understood the tenets of their religion well, and could explain and defend them in a most masterly manner ; and I began to see there was more in the Catholic religion than I knew, though I was not convinced I was wrong in being divided from it, as I still thought it was erroneous and unscriptural in many points.

The first thing which changed materially my views of the Catholic faith, was a correspondence, which I kept up with an unknown person for about half a year. This person stated, that he had been travelling abroad, and having frequently entered the Catholic churches, and surprised to see how devout and holy the services were, he was led to examine further, and began to entertain doubts of the wisdom of the English reformation. I thought I could soon set him right by pointing out to him, what I had for some time thought denunciations against the Catholic Church, in the Apocalypse, and in other parts of the scripture. In the course of our correspondence he forcibly opposed these ideas, and so far from allowing that they could be proved from scripture, he treated them as the mere inventions of men. I was then led to ask myself, whether I had drawn them simply from scripture, and found that I had never entertained them before, some Protestant commentators had put them into my head. My principle was to attend to the word of God alone, I therefore determined no longer to pay regard to those ideas, unless I should find the scripture of itself lead me to them. From that time those ideas never made any impression on me. I never knew who this correspondent was, until I went abroad, to prepare for my ordination ; I then learned that it was a young lady, who was on the point of becoming a Catholic, but who for further satisfaction wrote to me, and to one or two other Protestant clergymen, to hear what we could say in defence of our religion. You may naturally suppose, that our answers, instead of weakening, would rather confirm her attachment to the Catholic faith. She became a Catholic, and was on the point of being professed a nun, in the order of the Sacred Heart, when she died a holy and edifying death. Owing to this correspondence, I became much more willing to give Catholics a favourable hearing, but it was yet three years before I was led to the further step of embracing the Catholic faith. This was brought about in the following manner. I had made acquaint-

ance about the year 1829 with Mr. Ambrose Philipps, eldest son of the Member for Leicestershire. The conversion of this young gentleman to the Catholic faith, at the age of fourteen years, (about seven years before I knew him,) had very much surprised me when I first heard of it. His character and conversation interested me, and with pleasure I accepted his invitation to spend a week with him at his father's house at Garrenden Park. I was in hopes that I should thus have an opportunity of inducing him to think more correctly about religion. I had indeed no great hopes of being able to dissuade him from the Catholic religion altogether, nor did I earnestly wish it, for I had been already convinced that men might be good Christians in that religion. I left home for Garrenden Park, January 24th, 1830, on Sunday night, after preaching two sermons in my Protestant church at Brington, in Northamptonshire, of which I was rector ; and little did I think then, that those two sermons would be the last I should ever preach in a Protestant church. All the time at Garrenden was nearly devoted to religious conversation, and I soon found that instead of my being able to teach Mr. Philipps to think more correctly about religion, I was obliged, in many points, to acknowledge that I had to be a learner myself. I found him well able to stand his ground in defence of the Catholic faith against me, and some other more experienced Protestant divines, who occasionally joined our conversation. At last, finding that I was contending with obstinacy, and not with the candour I professed, I made up my mind to look into the affair with a new feeling, and with a real determination to follow the truth. This resolution gave me immediate comfort, and the consequence of it was, I was soon delivered from all my doubts. I had intended to have gone home on Saturday, to resume my duty at Brington, but I first went with Mr. Philipps on Friday to Leicester, where we dined and spent the evening with Mr. Caestrack, an old French missionary, who had been stationed at Leicester for several years. The kindness and patience with which he met my objections, made me more willing to listen to correction ; his statements and reasoning came upon me with an authority and conviction which I felt I could not, and must not resist, and before night I declared my submission to the Church of God.

The conversation of Mr. Caestrack had satisfied me, that the Roman Catholic church was that church which our Saviour had founded ; and as he had promised that hell gates should never prevail against his church, and that he and his Holy Spirit should remain with it for ever, teaching it all truth, and had commanded it should be obeyed in words so clear, "he that will not hear the church, let him be unto thee as a heathen and a publican." Matt. xviii. 17. I felt convinced that in obeying it I was doing the will of Him, on whom I had placed my firm and only dependence for peace and salvation, and in doing this I knew I could not be led astray. Thank God ! I put aside the thought, which first offered, of going home and looking into the affair the week after. The step which I took the next day of professing myself a Catholic, is one on which I have never reflected with any thing but comfort, as I do even at the present moment. The truth is so plain that the Catholic Church was founded by our Saviour, that it has all the four marks of Christ's Church, and that it has Jesus Christ's infallible word that it shall continue until the end of the world. The Protestants indeed tell us that it was first the true church, but that it afterwards fell into idolatry, and damnable doctrine ; but they cannot show how, when, and where it fell into idolatry and damnable

doctrine. I thought it therefore more prudent (and so I now do think it) to trust to the infallible promise of our Saviour than to any man's assertions; and if my resolution to become a Catholic on this ground was sudden, I defy any man to prove it rash. I saw that God promised me no better opportunity than the present, so I sent a messenger home that night to announce my resolution, and I made my abjuration of the Protestant faith in Leicester chapel, on Saturday morning, the 30th of January. I had had for a long time no thoughts but of serving God in the ministry of that church, whichever it was, that I should find to be the true one; and so I at once offered myself to Doctor Walsh, Catholic bishop of the midland district, who sent me to the English college at Rome, where, by a happy coincidence of circumstances, I was ordained for the English mission, May 26, 1832, St. Augustine's day, in St. Gregory's church, the very spot from which St. Augustine received his mission from that holy pope to undertake the conversion of England; and I humbly ask your prayers that I may be, by his mercy, an humble instrument towards its reconversion, which I trust is not far distant, and which it is the dearest desire of my heart in this world to see accomplished.—I am, dear Sir, yours most truly,
 GEORGE SPENCER.
West Bromwich, Jan. 3, 1834.

INNS OF COURT.

THE income derived by the Inns of Court from the letting of chambers is immense. We have heard that the rents received by the Middle Temple alone greatly exceed 60,000*l.* a-year. This may be an exaggeration—it may, too, be greatly under the mark; but what the public and the members want to know is, the distribution and application of this money. These voluntary associations were instituted for national purposes—have they fulfilled the ends of their institution? The law has had a supervision over corporations by the exercise of a visitational power. Are the inns of court to be the only body in the state uncontrolled? for it seems now on all hands to be admitted, that the judges cannot compel them to admit a man to the bar, much less to say how they disburse their funds. If a deacon is refused ordination, the law provides him with a remedy. So if the bishop or ordinary refuse institution or induction to a clerk, regularly ordained, and not *minus sufficiens in literaturâ*. But the benchers of the parliament chamber are more sacred than the bishops, and less restricted than the King, for his Majesty is sworn at his coronation not only to perform certain acts and duties, but to abstain from performing others which would be deemed highly criminal.

One should think that in an apprenticeship to these inns, that it was meant by implication that something should be learned. So it was in the olden time; and with that view, readers were appointed by each inn to lecture the "apprentices at law." These readers were eminent men, who were paid a certain sum for their trouble, and some of their readings have been handed down to us. We believe, for we speak from memory, Mr. Anthony Bacon was one of the readers—and Mr. Callis—who wrote the Reading on the Statute of Sewers—was another of them. These were the guides and tutors, as it were, of the students of the inns of court in the dark ages; but in the present enlightened day, when laws are so much more voluminous—when the Statutes at large weigh nearly a ton in bulk, no such guides are deemed necessary—readers have been abolished—and the student is allowed, either to grope his way in the misty light of his own feeble reason, "darkening counsel by his imperfect knowledge," or to sit down in fat contented igno-

rance of *precipite and qui tam*, of *Habeas Corpus* and the Writ of Rights. At the end of his career, no examination takes place as to his sufficiency in law. He shall be admitted to the degree of utter barrister, if he be as indoct as the late worthy Mr. John Fuller; but woe to him if he be a Dissenter and a Church and State Reformer; and ten thousand miseries if he be a man of parts; for then the precedents of Horne Tooke and Whittle Harvey shall stand in his way, and he shall be thrust aside by some such simpleton as an embryo Justice Shallow, or some such "roysterer" as his worthy colleague, who was, in his day, of Gray's Inn, and who had oftener heard the chimes at midnight than the moot points in the Mooting-hall.

In the late discussions in Parliament, one would think from the tone of Sir James Scarlett, that in order to be a barrister, it was above all needful that the candidate should be of gentle blood. Sir Edward Saunders, one of the greatest lawyers that ever lived, had been a filthy and unwholesome beggar about the inns of court. He was an eminent punster, even when he carried the mendicant's wallet; for he used to boast, when waiting for the broken victuals that fell from the bench table, "that he was a better lawyer than any of them, for he had more *issues* in his body (he had no less than seven running issues) than the twelve judges together." This man became celebrated as a barrister, and he died a judge. In his Reports (the best which have ever appeared before or since), we find him unblushingly relating, as if it were a matter on which he plumed himself, that the bench had reproved him "for pleading subtly and deceptively, in order to trick the court." Later, we find an eminent barrister convicted of slitting a man's nose, and pleading, when indicted for maiming, that he meant not to maim but to kill; and so late as 1761, we find a barrister malevolently and dishonourably boasting that he had drawn the declaration in a lengthy and intricate way, to catch the defendant, and to scourge him with a rod of iron: and that he had so improved in the art of pleading, that the paper book would amount to 3000 sheets, and that he would, therefore, ruin his opponent; whereupon the court directed the settling of the case in a quarter of a sheet of paper. Yet these men were admitted to that degree which Mr. Harvey was denied. So true it is, in the words of the ancient saw, "that one man may steal a horse, while another may not look over a hedge."

Having said so much on the irresponsible power by which candidates are prevented from going to the bar, we shall now make a few observations on the tyranny exercised towards young barristers when they are admitted to practice. In the first place, in joining his circuit, he is not allowed either to rest or board at an inn, or to travel in a public coach. Peers and members of Parliament—baronets and esquires, think it not beneath their dignity to travel in these conveyances; but an utter barrister, who may not have five pounds in his pockets, *dare not* do so—it would be *infra dig.* and he would most surely be "cut" by the profession at large. Again, Royalty itself may eat, drink, and sleep at an inn; but the poor practitioner at the bar may do neither the one nor the other. If he is but to remain for even one day at a circuit town, he must rent lodgings, and pay from one to two guineas for his night's rest. This regulation may be very much adapted for the purposes of men making large annual incomes, but it is a serious practical grievance to the junior members of the profession.

On each circuit there is what is called a bar mess, to which admission is obtained by ballot, and one black ball excludes. If a junior be admitted, and do not find it convenient to dine, he is fined five shillings for staying

away. The great practical grievance is, however, the power of exclusion practised in the dark. The most honourable man may be thus wounded, under the cover of a ballot, by a relentless personal enemy, who has previously wronged and injured him, and takes this opportunity of stabbing him in the dark. It may be said that these regulations are necessary to the respectability of the profession. They are not found necessary in Scotland or Ireland, in both of which countries the bar has as high a character for respectability, learning, and gentleman-like conduct, as the bar of England. The great aim in England appears to be to make this liberal science a profession for the rich alone: to create a sort of monopoly for those who have abundant means and great personal connexions: and it must be avowed that they who have risen in the teeth of these obstacles—the *novi homines*, who have overstepped all impediments, are among the most strenuous enforcers of absurd and unjust systems of exclusion. We might cite the examples of two Scotchmen, one recently rejected by his constituents, and the other the Member for a metropolitan district, in confirmation of this statement.—*Parliamentary Review*.

CORRESPONDENTS.

We have received two letters from Southcottians of the old school, opposing our doctrine of Universalism, and quoting from their writings in confirmation of the truth of the old doctrine of the world, that God and Devil are two distinct, separate gods, enemies of each other,—one letter from Thomas Malby, another from John Pye. These gentlemen are both right. God and Devil are as much opposed to each other as light and darkness, as we have always affirmed; and we have also acknowledged (p. 207) that the doctrine of two separate beings is taught in the woman's writings, as well as in the Bible. How then can they prove us wrong, when they prove the very thing which we ourselves affirm and teach? If they were as condescending to us as we are to them, all would go on well; but they must have all to yield to them, while they yield to none. Don't they know that charity believeth all things? and have they forgotten the virtues of charity, described by their mother, as being the very mother of the child which should redeem them—"Charity and the child you'll see," &c.?

God and Devil are two principles of *one* nature—even as love and jealousy of *one* mind; there is no mystery in regarding them as both one, and yet two. If so, what do our correspondents say of the Father and Holy Ghost, which are one, and yet two? God merely sends himself from heaven when he sends the Holy Ghost. If our correspondents don't regard revelation as a mystery, *intended to conceal truth* from man, and framed on purpose to keep him in the dark until the end,—then we leave them to their own dreams and visions, and only hope that they may live and die rejoicing in them. The Bible and their own writings all declare that God purposely conceals the truth by similitudes, types, and dark language, and that this mystery was not to be unriddled until the end. That they know not this mystery is evident, for they have always been deceived in all their conjectures; but if they still fancy they know it, we don't begrudge them their knowledge. We are not analysing *their* private opinions, but only the books. We never meddle with persons, and we are no ways anxious to make converts of sects or parties. We want only to pick up the intelligent and discreet, who are disgusted with party strife and exclusive notions, and who are anxious to find a more liberal and generous system of doctrine than has yet been taught.

It is evident that our two correspondents do not under-

stand our doctrine. They have been too hasty in taking up the pen. They ought to have waited till they understood our meaning somewhat better. If they imagine that our doctrine does disparagement to the character of deity, they are quite mistaken. It is the only doctrine ever yet taught that justifies the ways of God to man; for it shows the necessity of evil to teach man knowledge, and consequently proves that evil is ultimately a blessing. Let them read the *Shepherd*, No. 19.

The wisdom of this world has always erred upon these sublime subjects. It must all be destroyed; and it is against the wisdom of this world that we fight, with weapons not carnal, but spiritual, and powerful to the bringing down of strongholds of delusion, as they have already proved with many of the Southcottians themselves. Our correspondents imagine that they are fighting with divine wisdom. Very divine, indeed, it must be, when it is merely the wisdom of all the old world, the old priesthood, and the delusion which has deceived them hitherto, and still deceives them with dreams and chimeras, which are nothing but ardent spirits to create spiritual drunkenness and spiritual folly! The works of God in the human mind are always advancing, not standing still because a man or a woman has died; but sectarians are blinded by their self-conceit, and will never believe that God is carrying on the work of human discipline, unless, forsooth, their vanity is gratified by the fulfilment of some of their own preconceived notions.

We advise our correspondents to wait a few weeks longer, with a friendly patience, and not suffer their zeal to carry them too far; and when they quote, if they want their letters to be inserted, they must quote very shortly; for we cannot insert much of the woman's doggerel poetry at once. There is too much *chaff*—we want the grain only. The quotations we made in page 207 are still unanswered, and unanswerable; and in addition to these we beg our correspondents to examine the following from the Bible. Compare John xii. 40, with 2 Corinthians iv. 4; also 2 Samuel xxiv. 1, with 1 Chronicles xxi. 1. We shall give them no more at present; but ask them to point out a lie that ever the Devil told, and how it happens that the Lord says he will make all the Devil's lies true in the end. And what is the meaning of the Lord having two complexions, a black side and a white? And if mystery is not deception, since it leads men astray to false notions? And what difference there is between deceiving a man by a bare lie, and deceiving him by a vision and an ambiguous oracle. Can they answer all these things by their human wisdom?—for our's is the wisdom of God, and not of man, inasmuch as it is universalism, the wisdom of the infinite deity.

We have a difficult course to steer between the two breakers of faith and infidelity, each of which is threatening destruction to the Universal Shepherd; but we are not alarmed; we shall do the work for which Nature, the Devil, and God have fore-ordained us. All the three are in us; Nature prompts us; God instructs us; and the Devil checks us; and so we get on, our hand against every man, and every man's hand against us.

A LECTURE upon Tellurism, or Animal Magnetism, by THE ALPINE PHILOSOPHER, at the request of the "Society for the Acquisition of Useful Knowledge," on Tuesday evening, March 17, at Eight o'clock, at 36, Castle-street East, Oxford Market.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

The Shepherd.

[Price 1d.]

SYSTEM OF NATURE.

"As it is in Nature, so it is in grace;" we forget who says so, but so it is. The same law of succession, generation, and progress, prevails over all. That which is sown appears to die; it always corrupts, and communicates the vitality it once possessed to that which rises out of its ashes. Every species of seed has two extremes: one grows down, another grows up. It is not by accident, as your men of chaos teach, that the one is directed up and the other down; for, turn the seed which way you will, the growth which is destined for the earth will go downwards to the earth, and that which is destined for the atmosphere will ascend. In this one universal phenomenon, you see the history of man and of human society; the fall of man is the downward growth, the growth of the radicle, which takes root in the earth, gives stability to the plant, and opens up a communication with the soil, from which its nourishment is principally derived. Is this downward growth an evil? do we regret that it ever took place? are we sorry that the germ did not immediately rise upwards, without giving birth to such a monstrous apparatus of crooked roots and branches underground; barren, moreover, and destitute of any traces of beauty? This is a matter of fact for our fact-mongers—a universal fact; but what do they make of it? do they reason upon this fact, or do they reason in accordance with it? No; they do violence to the fact in the very elements of their philosophy; both believer and unbeliever laughs it to scorn. The Christian says, what a pity man has sinned, that is, grown downwards; and the unbeliever denies, doubts, and ridicules, *because* man has sinned. But the germ of universalism will grow up between these two foolish extremes, which are doomed to everlasting oblivion.

Jewism, as we observed last week, is the living seed of the word, which for ever grows, changing and modifying its nature as time progresses. How do we prove this? Why not some other religion, as well as Jewism? Because no other is progressive, and because it has gained the superiority of all others. The Brahmin religion is, perhaps, as ancient, but it is not progressive, and, moreover, it is entirely insulated; it has made no conquests, either by argument or by the sword, and, above all, it has been *subdued*; and that is the great test of inferiority. Its followers are several grades below the highest rank of civilization and intellectual eminence. Mahometanism made its conquests by the sword alone, and although for a long time a rival, if not superior, to the gothic invaders of Christendom in the dark ages, has now, long since,

yielded the palm to Christianity, or Judaism spiritualised. This is the greatest of all religions, and it can trace back its origin much farther than any other. Tacitus himself acknowledges that, whatever was the origin of the Jewish religion, certain it is that it is much older than any other. Here it is, then, standing supreme like man amongst the brutes, and bringing all those brutes under subjection to its paramount authority; for to Abraham, and to his seed, was the promise given, that they should be heirs of the world; but it was not the bodily, but the spiritual seed; for he is not a Jew who is one outwardly, but he is a Jew who is one inwardly.

But it was not until a scattering took place, and a gathering afterwards, that that promise was to be fulfilled; they were to be scattered amongst all nations, from one end of the earth to the other. In this respect they stand as types of truth, which is scattered amongst all people, sects, and parties, and broken into a thousand fragments. Before this broken body and shed blood of truth can be enjoyed, these fragments must be collected and joined together; therefore, the prophetic writings, speaking of truth under the emblem of a nation or family, uniformly maintain that Israel shall yet be gathered into his own land; Israel shall blossom and bud, and fill the face of the world with fruit.

This literal scattering was necessary for a literal or material church, such as the Jewish church was in its ceremonial character; but in the Christian church we have another species of type, representing, however, the very same universal truth, namely, the infinite division of mind, or sectarian opinion. The Christians are not scattered, like the Jews, in countries not their own, without princes and governors of their own faith; they have all those blessings, if blessings they may be called, which have been so much abused; but the scattering of their minds is quite as effectual and remarkable as the scattering of the bodies of the sons of Jacob; both are perfect counterparts to each other, and the two together make up the bipolar character of the church, consisting of body and mind, now experiencing, in the literal and most unequivocal sense of the word, the doom that was pronounced upon the future heirs of the world, namely, a universal scattering before a universal gathering.

Now, there are wise men in the world rash enough to suppose that they can extinguish the name and remembrance of this great family for ever, and that, however correctly its destiny has hitherto accorded with the ancient predictions concerning it, it shall no more. There is no harm in trying this; a man is always the wiser for ascertaining his own strength, which is only to be discovered

by experiment ; but such persons will find at last they have been labouring under a deep delusion, practised upon them by God himself, in order to bring into being an opposite extreme to that of old faith, that the germ of universalism might grow up between them, like the peabud from between the two lobes of the pea, which the fertilizing earth has torn asunder to give birth to her tender offspring.

It is for this very purpose that the world has of late years divided itself into two distinct lobes, of believers and unbelievers. Truth is with neither ; it derives its being from both. They are the parents ; it is the offspring. All this is in perfect harmony with the other proceedings of Nature. Even to suppose that either party could subdue the other, is an absurdity. To one who has analysed Nature, the very idea is ridiculous. It is only plausible to the ignorance of sectarianism, which looks at Nature through coloured spectacles, or through the loopholes of a prison of intellectual bigotry and degradation. Nor could universalism arise into being without both. We regard the two extremes as the very legs upon which we stand ; they are necessary to our being and our progress. Were the extreme infidel not aware of the powerful enemy he has to encounter in the ranks of faith, he would not lend an ear to one who reasons, like ourselves, from a book which he despises ; he would dash on in his favourite system of chaos, and rejoice in the anticipation of banishing for ever from the human mind the idea of God, and all the sublime conceptions to which that monosyllable gives rise. Were the believer not aware of the powerful opposition he has to encounter in the ranks of infidelity, he also would repose in the full assurance of an everlasting continuance to the antique dogmas of the church of his fathers ; and neither of them would lend an ear to a doctrine which shocks the prejudices of both, by reasoning upon principles which they were never taught in youth, and have never even imagined in riper years.

We shall witness the decay of these two parties as we go on. They will separate more and more distinctly from each other, and internal divisions will destroy them both. Christian will fall out with Christian, and infidel with infidel. The most deadly hatred will be experienced amongst those who hold the same name, and profess to belong to the same family. Christian will charge Christian, and infidel charge infidel, with knavery and imposture ; both will be right and both wrong ; the accuser as right and as wrong as the accused. Each will boast of his own worth, whilst he defames all the rest of mankind as deceivers, hypocrites, and scoundrels ; will believe only his own testimony, and complain of the illiberality of those who follow the example, and question the truth of his. "Teach the people our facts," cries one party. "Nay, teach them ours," cries the other ; "your's are all false." All this is taking place already ; and the evil will become more and more manifest. It requires no particular revelation to foresee ; it requires only a simple and correct analysis of the principles of the two parties, which fundamentally are nothing but chaos, and can produce no other effect than chaos.

In the meanwhile the principles of universalism must progress. They are the only mediator between the God

of faith on the one hand, and the MAN of infidelity on the other. It is impossible to devise or even imagine another mediator. It is quite inconceivable ; for it is a universal friend, and a universal solvent of all difficulties and doubts. It is in this conviction that we repose with perfect assurance on its ultimate success ; and it is by this assurance that we are taught to repress all inordinate foolish zeal in pressing it forward. We shall take advantage of every favourable opening which Nature, in her unerring providence, presents ; but we shall show little of the fury, or the enthusiasm, of political, ecclesiastical, or proselytising fanaticism, which has been the principal weapon of conversion in by-gone times, and is still considered, even by the wise, as essential to success,—such success, however, as always brings confusion on itself, by hurrying around a new and a plausible principle of action a host of impatient uninformed fools, who are eager to proceed to work immediately ; like the savage chief, who could not wind up his watch, they break it to pieces because it won't go.

The true gathering of the Jews is the gathering of all religions into one. Judaism is the beginning of progress, and universalism is the end. Universalism is only Judaism refined. The Jewish church was merely an emblem of the catholic or universal church. Its principle was unity ; the unity of God ; the unity of religion ; the unity of the temple. There was only one temple for the whole Jewish nation. There all the tribes and families of Israel resorted ; and one temple only there will yet be for the world, a universal church, without even a dissentient voice to disturb its peace. The foolish believers of old 'Mamma,' and the Jews themselves, actually imagine that the Jews are to be literally gathered as a people ; and many of them imagine that the Messiah is to build up the old city of Jerusalem, and make it the capital of the world. Experience teaches fools wisdom, they say ; but there are some exceptions ; and as neither Jews nor Christians have ever yet found their prophecies fulfilled as they expected them, they ought to have been persuaded that their literal interpretation was not the right one. And why should it be a right one? Why should one nation be set over another, upon the old barbarous principle of *hereditary* succession? Even Paul himself insists that the promise was not given to Abraham's seed in that sense. And moreover, why should there be family distinctions in a state of society where divisions are to cease, and there is to be one fold, and one shepherd? Is it not more consistent to suppose that all nations and families shall merge into one, and that all men shall become Jews, Christians, and Mahometans, by an amalgamation and marriage-union of the faith and blood of all? Yes, this is the consummation ; the everlasting oblivion of all family and national distinctions, by the spiritual and mediatorial influence of universal sympathy. It is not Jews nor Greeks who are to be gathered. It is principles only. The gathering is spiritual, or mental ; it takes place in every man's mind. Here all the Jews must be gathered ; this is the land which they are to inhabit ; this is the Jerusalem which is to be built up again ; this is the temple where God in unity must dwell. Any other gathering is useless with-

out this. To gather a whole nation bodily would profit them little; it would only be the occasion of petty individual contentions. But to gather the fragments of scattered truth into the human mind is the true and only useful gathering of the people, for it furnishes them with a principle of united action and prudence, which secures the happiness of each and all. When, therefore, we propose to gather the Jews, let not our readers imagine that we are looking after the black-eyed, hawk-nosed pawnbrokers or old-clothesmen of Sparrow-corner, or any of the other trinket-dealers and stock-jobbers, who go by the names of Moses, Solomon, and Issachar. The literal Jews are the very last who will see the truth. The Scripture law, "the first shall be the last, and the last first," is a law of nature which cannot be altered. The infidels are the first, the Christians next, and the Jews afterwards. The last move of the infidels is the very first; the last move of the Christians next; and the most infidel or least bigoted of the Jews next. This is the order in which they move. Nature teaches it, and the Scriptures confirm it. The old dogmatists of all the three will stand out to the last. These are wiser men than we are; and, having clearer eyes, must be expected to see better without spectacles! However, every man must follow his own eyesight, and not that of another.

THE SHEPHERD.

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER XII.

"Sol et Luna ad rerum ortus, et obitus augmenta et detrimenta, divinitatis organa sunt."—HERMES *Asclep. Arc. 2.*

The Sun and the Moon are the organs of God for birth and death, for the increase and decrease of natural objects.

I HAVE indulged, as far as I could, the taste of our contemporaries; they are anxious to have facts, and I have given them facts in plenty.

To-day I will amuse myself in dealing at large with principles, and thus make my own letters the representatives of the great law of nature, which is the cornerstone of the edifice, for the construction of which the *Shepherd* collects the most important materials.

Science is also subjected, like every other thing in nature, to the law of bipolarity.

It is composed of two halves—analysis and synthesis, facts and principles, practice and theory.

The generality of scientific men have got but one half of the science; they are mere experimentalists, or fact-mongers. It is true, they pretend to have also a set of principles; but their principles are nothing but partial assumptions, wanting universality, unity, and consistency. Hence the facts which they have collected are like unto a chaos, wherein light and darkness, solids and fluids, are huddled together, expecting the *creative word* to bring them into harmony and life. This word is *bipolarity*.

Let us trace once more the outlines of the great system of nature.

There is but one principle, which is God; which principle, in order to give birth to life, divides itself into two opposites, the will and the unwill, (*voluntas, no-*

luntas), the male and the female, the positive and the negative. Life is action. Life is only life as far as it acts; but to act demands multiplicity of combinations. Combination, however, is only possible between two opposites—one that acts, and one that is acted upon. This difference between the two opposites causes the tendency to union and discord, to discord and reunion. If two principles were equal, motion would be impossible; both would be at rest. But rest is an absolute death, and God is absolute life; but since God is one and all, rest and death are absolute impossibilities.

The most universal form under which the law of polarity manifests itself is magnetism, the magnetism of the planetary systems.

In these systems magnetism reveals itself by attraction and gravitation; in them the suns are the representatives of the positive, and the planets of the negative pole. Light is nothing but the magnetic spark, formed by the rotations of these great revolving-batteries. Galvanism, electricity, and all chemical affinities, are but individual magnetical phenomena. In the universe, the sum of all individual lives remains the same, as being the sum total of the polarities.

All that *is, lives*; and all that lives is subjected, as a part of the whole, to the universal law of sympathy and antipathy; and, in its quality of individual, to a particular sympathy and antipathy.

There is a universal time, and a universal space, universal succession and universal extension; universal time and universal space are real and absolute. There is also an individual time and an individual space, which are ideal and relative.

The confusion between the twofold natures of time and space has caused the errors of Berkeley, Kant, and their followers.

In universal time, as well as in universal space, both succession and extension are one and indivisible. The past, the present, and the future are one. Here and there are one.

If one could form a clear idea of the *absolute* unity of succession, and of extension, in universal time and the universal space, he would have found the key of the sanctuary, in which lie the mysteries of somnambulism.

The vulgar mind regards as miracle that which it has never seen before, though the marvel is only in the novelty; that which is really wonderful escapes its notice. A Laplander would look upon a printing machine as a wonder; and yet he has noticed all his life the aurora borealis without thinking for a moment of unriddling this great wonder of telluric life!

If you throw a stone into a pond, all the water is agitated; do you think for a moment that nothing similar occurs when any of the great luminaries is moving in the great ocean of the universe?

Man, as a part of nature, is subjected to the universal law; as an individual, he has, moreover, the laws of his own nature. He is subjected to general and individual sympathies and antipathies. When he follows universal laws, he is subjected to necessity; when he follows his own laws, he is directed by liberty.

During the day-time he is subjected to the solar life,

the positive pole of his planetary system; during the night he is subjected to the telluric life, or negative pole. The one state we call being awake, the other being asleep.

In none of these two states are [we at rest: we are continually acting; with this difference, that during the day the brain is busy, during the night the ganglia are active.

Those ancient philosophers who thought that the stomach was the seat of the soul, were not so foolish as many modern writers would make them appear. The stomach, or the plexus solaris, is really the soul of the night. Van Helmont once put himself, by means of a narcotic draught, into a state similar to somnambulism. During this state, he thought, and felt, and saw with his stomach. This experiment suggested to him the idea of placing his archæus, or the spiritual principle of life, in the stomach.

We live, then, a twofold life, a day life and a night life; and in both lives we are living according to two opposite laws, the universal and the individual laws.

Both lives, both laws, form the life and the law, because the two halves form the one.

The magnetic spark kindles the whole of nature, and its ashes are nought but seeds of new combinations.

These combinations are brought about in the following succession:—first, gravitation and expansion, or centripetal and centrifugal power, which produce motion, motion produces light, light produces gas, the gases produce the air, and then, by combining together, the water, afterwards the earth and minerals.

From these combinations come, first, plants, then animals, and finally that being which we call man. These divers productions are continually composing and decomposing each other, in binary, ternary, and quaternary combinations, wherein one component part is always the positive, and the others the negative; and that which causes them all to move, to combine, and to harmonize in concord and discord, is the one universal spirit, which is the universal intelligence as well as universal love. And he who has known this spirit, lives in the spirit, and the spirit dwells in him; and he calls forth the powers of the elements, and performs, as it were, the acts of creation; he watches the movements of the stars, and listens to the laws of Nature; and, in all his endeavours, has but one grand object in view, which is to worship the bipolar God, in spirit and in truth, that is, in his spiritual and in his material form.

THE ALPINE PHILOSOPHER.

THE DOCTRINE OF THE "WOMAN."

NO. V.

In our last article we alluded to the three latest movements in scientific faith, infidelity, and revelation, in all of which some genuine fundamental truths are to be found; but as all the three have a separate and sectarian existence, unknown to and despising each other, there is no likelihood of any intercourse being ever opened between them.

In fact, intercourse between parties is now an impossibility. They are generally rooted to certain creeds or articles, beyond which they will never budge one step, and by which all the old adepts and disciples, with a few liberal exceptions, will abide with strict fidelity, till death

put a seal upon their obsolete dogmas for ever. As mind progresses, it generally picks up the young and the vivid, or those whose neutrality or ingenuous candour has seen enough of the imperfections of former doctrines to convince them that something more is a-wanting to give satisfaction to the curious and philosophic mind.

Of course the conversion of sects and parties is an idle and frivolous hope, which can only be entertained by those who are utterly ignorant of human nature. Such a thing never yet took place, and never can. Neither miracles nor mathematical demonstration are sufficient for such a purpose. The reasonableness of a doctrine is no good reason why it should convince or convert the human mind, which is as prone to combat the demonstrations of science as the fallacies of fable and imagination. Nor have those who propagate certain obvious truths any reason to complain of the indifference of others, for they themselves are equally blind and deaf to equally demonstrative truths of another sort, which are propagated by their opponents. The sectarian spirit is universal, and the infidel is not an exception in the list of division.

We have already witnessed this sectarian and illiberal spirit in some, we won't say many, of our readers. We knew we should try their boasted liberalism when we set out; and therefore we gave them a hint at the very outset. We knew what their liberality and their charity were; namely, mere prattle and moonshine; like Milton's Death, a thing without shape or form, or solid substance, but threatening death, and cherishing hatred to every thing but its own ghastly self. We hear much about liberals, but we know not where they are; for every specimen of liberal that we have ever yet met with, is merely the personification of contempt for that which it does not understand, nor deign to examine, accompanied by a most unmeaning cry of "teach the people the knowledge of facts," without knowing what facts are, and with a determination to shut its eyes to all facts but those of a certain species. In fine, we never yet met a liberal who was not afraid of some facts—afraid, because if those facts proved to be true, his system falls to the ground.

But will our readers point out one fact, or a possible fact, which would destroy our system of universalism? Let them imagine one if they can; try their wit upon it, and we shall answer them. We give them the greatest conceivable longitude and latitude, only preserving the present laws of Nature. Can any other party say so? If there never was such a man as Abraham or Moses, what becomes of the parsons? They would stumble and fall. If there ever was such a man as Jesus Christ, what becomes of the infidels, who deny his existence? If there ever were such phenomena as revelations by voice and vision, what becomes of the unbelievers, who deny them? And if there never were such things, what becomes of the churchmen, who depend upon this fact for the truth of their doctrine? If revelation has been continued to the present day, and new truths been made known as of old, what becomes of the old articles and chartered churches of eighteen centuries; and the matter-of-fact philosophy, which everlastingly prates about facts without knowing any thing about them? We can destroy all these sandy-bottomed fabrics of sectarian faith and sectarian infidelity, merely by a supposition. But let them bring forth a supposition which will destroy our doctrine, and we shall take that supposition as an undeniable fact, and prove the doctrine true in spite of it.

Here is an invitation which was never given to the world before. Ye matter-of-fact philosophers! come and fabricate your own facts, if you please, and we shall overcome you by your own premises. Ye visionaries! ye

midnight dreamers! that converse with spirits, angels, Deity himself! come with whole volumes of revelations to the contest; we shall acknowledge them all to be divine before we peruse them, and regard them all as conclusive in argument. Ye materialists, spiritualists, sceptics, nihilists, and all other personifications and representatives of the broken body and scattered fragments of our universal mother! come with your little baskets of small ware; your negatives and your positives, and all the little spangles and gewgaws of ignorant knowledge; come with them all, and however contradictory and incompatible they may all appear, we shall put them all together, and show you a living image of God himself, merely by setting each fact, each dogma, each conceit, each lie, in its proper place.

This is universalism; and any other sort of universalism is an impostor; but we shall receive him, for we are the universe, and reject nothing. [This is a digression, but not uncalled for.]

SOMNAMBULISM.

THE Belgian journals contain the account of a case of somnambulism or catalepsy, of a nature so extraordinary as to merit the attention of physiologists, and, if the assertions of those medical men who have seen her be true, must shake the scepticism of the most incredulous. The case of the patient, Sophie Laroche, a peasant girl of Virieu, in the French department of the Isère, aged fourteen, reminds one of the history of the Ursulines of Loudun, and the unfortunate Urbain Granadier, at the commencement of the seventeenth century; the details of which monstrous superstition, and of the still more monstrous cruelties practised on the unfortunate priest, filled all Europe with a scandalous celebrity during many years. In that instance, the whole was acknowledged to be an infamous deception; in the present, the facts appear to be well authenticated by many respectable and disinterested witnesses. Amongst others Dr. Dymard has published an interesting account of his visit to her during the last month. This is not a place for entering into details; suffice it to say, that the girl in question, in a complete state of somnambulism, with her eyes bandaged, or in total darkness—can read and distinguish by scent, voice, and touch, persons near or at a distance; that whilst labouring under the access, which lasts several hours, and sometimes days, she makes the most extraordinary revelations, discovers hidden and lost objects, finds her way about the town, understands Greek and Latin, penetrates people's thoughts, and answers questions upon subjects, which, during her natural state, she is wholly ignorant of. Her body, during some of these periods, appears to be endowed with a peculiar lightness and elasticity, so that she may be lifted up as though she only weighed a few ounces, or as if the mere approach of the hand served to render her buoyant. These, together with many other marvels, are recounted by hundreds of persons who have attentively watched her. It appears, however, that the accesses of catalepsy are gradually diminishing as she grows older, and that there is every prospect of their becoming totally extinct as her body gains strength. In the meantime, Sophie Laroche is the wonder and admiration of the whole department of the Isère, and has furnished fresh arguments for the speculations of the disciples of animal magnetism.—*London paper.*

GENUINE TORYISM.

"CARDINAL WOLSEY founded in Oxford the first chair for teaching Greek, and this novelty rent that university

into violent factions, which frequently came to blows. The students divided themselves into parties, which bore the names of Greeks and Trojans, and sometimes fought with as great animosity as was formerly exercised by those hostile nations. A new and more correct method of pronouncing Greek being introduced, it also divided the Grecians themselves into parties; and it was remarked that the Catholics favoured the former pronunciation—the Protestants gave countenance to the new. Gardiner employed the authority of the king (Henry VIII.) and council, to suppress innovations in this particular, and to preserve the corrupt sound of the Greek alphabet. The penalties inflicted on the new pronunciation were no less than whipping, degradation, and expulsion; and the bishop declared that, rather than permit the liberty of innovating in the pronunciation of the Greek alphabet, it were better that the language itself were totally banished from the universities."—*Hume.*

Such is a specimen of ancient legislation. Future generations will read with equal astonishment the historical records of our present law-makers, the ministers of stagnation, and the guardians of the vermin which it always begets.

NATURE AND ACTION OF THE BLOOD.

IN briefly glancing at this part of the subject, it is not necessary to enter into any investigation of the chemical nature and composition of the blood, because the action of that fluid upon the animal system is not chemical, that is, it does not obey the same laws which are obeyed in the chemical action of dead matter. Indeed, the whole action of the animal system is in opposition to these laws. The energy of life, though undefinable in any other way than by its phenomena, is more mighty than these laws, and holds them suspended as long as the organisation of the individual is capable of obeying the living impulse. When disease invades and deranges the system, the natural or chemical powers or properties of the component substances of the organisation begin to operate, and the disease takes more or less of a putrid type, so much so that, in certain states of disease, it appears that the matter given out by the affected body, even when in the form of insensible perspiration, and not discernible by any test, is capable of communicating the disease to healthy bodies in that mysterious way which we call infection. But it is not till the whole body has ceased to live, and a time longer or shorter, according to circumstances, has passed over it (always shorter the more the disease has of a putrid type, and the more energetic the action of nature around), that it yields wholly to the laws of inorganic chemistry—of that chemistry in which alone we can make experiments, and in so far explain principles by means of these experiments.

From these considerations, it is evident that, if we attempt to apply our common chemistry to investigate the composition of the blood, and thence venture to give explanations of any of the functions of life, we are in error; because we are attempting to explain the actions of the living body by means of agencies, the suspension of which is involved in the very notion and definition of life, and which cannot, by possibility, be exerted upon any part of the body till life itself is extinct.

It is necessary for us to be constantly upon our guard, lest we should confound dead and living action, because there is, not in the ignorant only, but in the scientific, and indeed in them more than in the ignorant, a constant tendency to this confusion. This arises from the succession of fashions in philosophy, which follow the same

law as fashions in common matters, but are far more inveterate, and we may add, far more mischievous, because they affect the whole character of society, intellectual and moral; while the others, if they do this at all, do it only at second hand.

When the principles of mechanical philosophy were in their prime, and, as it were, held the whole field of science, it was the fashion to attempt the explanation of everything upon mechanical principles, and not only the action of the living body, in all those functions which are necessary for the preservation of the individual, but sensation and perception, and even thought, were attempted to be explained on the same laws which determine the motions of the planets in their orbits, or the tidal motions of the ocean waters. When chemical science (the principles of which being of a more complicated and less obvious nature, necessarily came after those of mechanical philosophy) had made such advances as to take the lead and become the fashion, the whole action of the living body was considered as chemical, and explainable by the laws of chemical attractions and repulsions, with their attendant compositions and decompositions. This was not, in an intellectual point of view, carried so far as the other; for no one ever gravely supposed that sensation, far less thought, was a result of chemical action, or ventured to recommend alembics and crucibles, with sand-baths and fires, as appropriate substitutes for the old and vulgar process of thinking. They did not even attempt, by chemical means, to give sight to the eye, or hearing to the ear, as had been partially done by the application of mechanical instruments; but in so far as what may be called the proper functions of the body, those which develop its organisation and preserve it in a living and healthy state, were concerned, chemistry was the rule of action, and when the body became diseased, chemistry was the grand means of cure. It is true, that a mixer of medicines had been called a "chemist" before this time; but a chemist, in the general sense of the term, means one who is possessed of, or who deals in, secrets; and in the composition of medicines there are some real secrets, and many more which belong to that class which are most safely kept—those in which there is nothing that can be revealed. In addition to these two general modes of endeavouring to explain the functions of the living body by means of principles, the resistance of which forms the best definition of life, there were always minor modes of a transcendental nature (or which could not be reduced to any principles) breaking in still farther to confuse a subject which is certain at all times to claim much attention, but which has at no time been explained, or even clearly defined.

Life, that which puts into action all the organs and structure of the animal body, is so interesting in wild nature, and so useful in domestication, is the portion of creation which all are most desirous of understanding; and, whatever may have been the case with any other subject, there is no human being, learned or unlearned, that has not thought and speculated about this one.

"Who, to dumb forgetfulness a prey,
This pleasing, anxious being e'er resign'd?"

is true, not only when we consign to the earth the mortal remains of those who are dear to us, but of our own living bodies, and of those of all the creatures which live around us. Hence, be it as crabbed or as absurd as it may, a book upon the functions of life, and more especially one upon the functions of human life, is sure to find readers, upon the same principle that he who pretends loudly enough to cure human disease is sure to find

encouragement, be his knowledge ever so limited, and his nostrums ever so baneful. This universal craving might be, and no doubt was intended to be, one of the great inlets of knowledge; but unfortunately it is just as greedy of error; and hence, as is the case with all those which, under proper regulation, are capable of effecting much good, it is made the means of much evil.

Nor is it easy to say whether the pretender, who seeks merely that living which he is incapable of obtaining by honest industry, or the man of science, who seeks for fame in an honourable way, has done the most mischief here. The latter of the two is deeply learned in the laws of matter, and, like a pedant who darkens language, naturally obscure enough, by his constant efforts to show his learning, or a man who has become so much inured to the technicalities of his craft, that he speaks in an unknown tongue to all who are unacquainted with the minutiae of that craft—he will be constantly introducing his mechanical philosophy and his chemistry, whether they are consistent with the subject or not.

Chemistry, in that form which admits of experiment, and can be reduced to a system in the schools, cannot in any way help to explain one single function of a living animal. Even in the formation of carbonic acid in breathing, the result is a chemical result certainly; at all events, it is a result which could be obtained by means of a common chemical experiment,—in other words, a product similar to that which results from the process of breathing could be obtained by other means; but the process is not the same, and we dare not call that chemical; it is similar with all the operations which are carried on in the living body; in as far as matter is put in motion, they are mechanical; and in as far as they tend to decompose any substance, they are chemical; but the energy by which these are accomplished is neither the one nor the other—it is physiological, belongs to the living state only, and when that state is at an end, it exists no more, and leaves not upon matter any trace of its existence.—*British Cyclopaedia*.

[Chemistry, in the foregoing passage, is taken in its strictly material or physical sense; but there is a chemistry of mind as well as of matter, which is subject to the same invariable laws. The power of mind over the stomach is well known; intense study, and absorption of mind, almost invariably constipate; whilst anxiety, fear, and other exciting causes, generally relax the bowels. But this is a department of science which is too little known. Men have been too much of materialists in their philosophy; and indeed, to such excesses have they gone in this soul-degrading system, that it has become quite fashionable to decry imagination, fancy, &c., as deformities in the human constitution. Every excess, however, cures itself; and the enthusiasm of exclusive materialism is well nigh at its height. It has been tried, and found wanting. There is another department of nature, besides matter; another chemistry, besides that of the furnace and the crucible; other medicines, besides pills and powders, and such like nostrums of the materialists.—*Ed.*]

THE COMFORTABLE OLD TIMES.

Speaking of the increase of luxury, Hollingshed says: "Neither do I speak this in reproach of any man, God is my judge; but to show that I do rejoice rather to see how God has blessed us with his good gifts, and to behold how that in a time wherein all things are grown to most excessive prices, we do yet find the means to obtain and achieve such furniture as heretofore has been impossible

there are old men yet dwelling in the village where I remain, which have noted three things to be marvellously altered in England within their sound remembrance. One is, the multitude of chimnies lately erected; whereas, in their young days, there were not above two or three, if so many, in most uplandish towns of the realm (the religious houses and manor-places of their lords always excepted, and peradventure some great personage); but each made his fire against a reredosse in the hall, where he dined and dressed his meat. The second is the great amendment of lodging: for, said they, our fathers, and we ourselves, have lain full oft upon straw pallettes covered only with a sheet, under coverlets made of dagswaine or hop-harlots (I use their own terms), and a good round log under their head instead of a bolster. If it were so, that the father or the good-man of the house had a mattress or flock-bed, and thereto a sack of chaff to rest his head upon, he thought himself to be as well lodged as the lord of the town, so well were they contented. Pillown, said they, were thought meet only for women in childbed; as for servants, if they had any sheet above them it was well, for seldom had they any under their bodies to keep them from the pricking straws that oft ran through the canvas, and rased their hardened hides. The third thing they tell of is the exchange of treene platters, (so called, I suppose, from tree or wood) into pewter, and wooden spoons into silver or tin. For so common were all sorts of treene vessels in old times, that a man should hardly find four pieces of pewter (of which one was peradventure a salt) in a good farmer's house. * * In times past, men were contented to dwell in houses builded of willow, willow, &c.; so that the use of the oak was in a manner dedicated wholly unto churches, religious houses, princes' palaces, navigation, &c.; but now willow, &c., are rejected, and nothing but oak any where regarded; and yet see the change, for when our houses were builded of willow, then had we oaken men; but now that our houses are come to be made of oak, our men are not only become willow, but a great many altogether of straw, which is a sore alteration. In these the courage of the owner was a sufficient defence to keep the house in safety; but now the assurance of the timber must defend the men from robbing. Now have we many chimnies; and yet our tenderlines complain of rheuma, catarrhs, and poses; then had we none but reredosses, and our heads did never ache. For as the smoke in those days was supposed to be a sufficient hardening for the timber of the house, so it was reputed a far better medicine to keep the Goodman and his family from the quack or pose, wherewith, as then, very few were acquainted. Our pewterers in time past employed the use of pewter only upon dishes and pots, and a few other trifles for service; whereas, now they are grown into such exquisite cunning, that they can in manner imitate by infusion any form or fashion of cup, dish, salt, or bowl, or goblet, which is made by goldsmith's craft, though they be never so curious, and very artificially forged. In some places beyond the sea, a garnish of good flat English pewter (I say flat, because dishes and platters in my time begin to be made deep, and like basons, and are indeed more convenient both for sauce and keeping the meat warm) is almost esteemed so precious as the like number of vessels that are made of fine silver. With us the nobility, gentry, and students, do ordinarily go to dinner at eleven before noon, and to supper at five, or between five and six afternoon. The merchants dine and sup seldom before twelve at noon and six at night, especially in London. The husbandmen dine also at high noon, as they call it, and sup at seven or eight; but out of term in our universities the scholars dine at ten."

Froissart mentions waiting on the duke of Lancaster at five o'clock in the afternoon, when he had supped. These hours are still more early. It is hard to tell why, all over the world, as the age becomes more luxurious, the hours become later. Is it the crowd of amusements that push on the hours gradually? or are the people of fashion better pleased with the secrecy and silence of nocturnal hours, when the industrious vulgar are all gone to rest? In rude ages, men have few amusements or occupations but what day-light affords them.—*Hume*.

FINE ARTS.

We love the fine arts, because they are the original source of refinement in morals. Men first polish rude matter, then they polish themselves, then they refine their language, then ideas, and then actions: this is the simple career of Progress. We therefore occasionally amuse ourselves with a peep at the exhibitions of artists. The water-colour exhibitions we particularly relish. It is a department of art which is quite modern, but brought to such a high degree of perfection, that it may be regarded as the favourite child of imagination, possessing all the beauties of contour, of proportion, and complexion, without the power and the sublimity, of manhood. A few days ago we were much pleased with a novel exhibition of the Houses of Parliament, in Regent Street, called Meadows's Views. There are four dioramic scenes; but the one which particularly attracted our fancy was the conflagration scene, which was managed by aid of machinery in so ingenious a manner, that the flame and the smoke were seen to move with a delicacy and simplicity which had all the appearance of real nature. The scene commenced in a species of moonlight; by-and-by the fire made its appearance; and as it increased, the Cathedral, Westminster Bridge, &c., which had previously shone dimly and darkly through the mist of midnight, came into view, and were finally illuminated with the rich rubicund glow that gleamed from the funeral pile of the wisdom of our ancestors.

DIVISION OF LABOUR.

I HAVE known, says Mr. Cooper, coatse wool hats imported from Manchester into Philadelphia, at three shillings sterling each, by the invoice. 1. The land-owner furnished the land that fed the sheep. 2. They are reared by the farmer. 3. They are sheared and washed by those who are accustomed to this operation. 4. The wool is sorted. 5. It is boiled with a little lye, to take out dirt and grease. 6. It is packed up for sale, and sent from the mountains of Wales to Manchester. 7. It is carded at a carding machine. 8. It is bowed by the hat-maker, with a bow made for the purpose. 9. It is crisped by sulphuric acid. 10. It is felted by the journeyman hatter, who is occupied in felting as the former is in bowing. 11. It is sent to the dyer, who uses gall-nuts from Aleppo, log-wood from the Bay of Campeachy, sulphate of iron from the coal districts of England, sulphate of copper from Cornwall, or the Isle of Anglessea. 12. It is glued and stiffened. 13. It is steamed and formed on a block. 14. It is banded and lined. 15. A carpenter makes the case in which it is packed. It is then (16) shipped to the foreign port. 17. The merchant importer sells it and packs it off to the inland retailer, who (18) furnishes it, at about the price of a dollar, to the wearer. It is by this division of labour, and the dexterity thus acquired, that the exporter of woollen hats can obtain a mercantile profit from so low a price.

Eighteen different hands were employed, a few years ago, in making a pin; not one of whom, if left to him-

self, could make twenty pins a day; by this division of labour, and the tools employed, they can make 5,000 each per day. At present, an engine makes 64 every minute. The effect of labour-saving machines is still greater. The machine for making wool cards, that for making cut nails, and the machine for making screws, are American inventions; whose operation is to increase the product of labour one thousand-fold. A piece of iron wire, put into the machine, in a few seconds comes out a screw, perfect in all its parts. A blacksmith could hardly make fifty in a day.—*Cooper.*

PROTESTANT INQUISITION.

There cannot be a stronger proof how lightly the rack was employed in the reign of Elizabeth, the founder of our Protestant church, than the following story, told by Lord Bacon:—"The Queen was mightily incensed against Haywarde, on account of a book he dedicated to Lord Essex, being a story of the first year of Henry the Fourth, thinking it a seditious prelude to put into the people's head's boldness and faction. She said she had an opinion that there was treason in it, and asked me if I *could* find any places in it that might be *drawn* within the case of treason. Whereto I answered, For treason, sure I found none, but for felony very many; and when her majesty hastily asked me wherein, I told her the author had committed very apparent theft, for he had taken most of the sentences of Cornelius Tacitus, and translated them into English, and put them into his text. And another time, when the queen could not be persuaded that it was his writing whose name was to it, but that it had some more mischievous author, and said with great indignation that she would have him racked to produce his author. I replied, Nay, Madam, he is a doctor; never rack his person, but rack his style; let him have pen, ink, and help of books, and be enjoined to continue the story where it breaketh off; and I will undertake, by collating the styles, to judge whether he were the author or not." Thus, says Hume, had it not been for Bacon's humanity, or rather his wit, a man of letters had been put to the rack for a most innocent performance. His real offence was his dedicating a book to that munificent patron of the learned, the Earl of Essex, at a time when this nobleman lay under her Majesty's displeasure.

LINES

ADDRESSED TO MARIA M.—

You gave me a braid of your hair;
I impress'd on its beauty a kiss;
Like the brow whence it came, it was fair;—
But I want not such tokens as this.

A remembrance of warmth who can need,
When ensconced near the bright evening fire?
In the full glow of midsummer's noon,
A token of light who'd require?

No!—my mind has received the bright stamp;
'Tis so clear, it can never depart;—
That no help to remembrance I want
Is told in each pulse of my heart.

If less pure or less full were my love,
Were my mind's regard of thee remiss;
Then, inert, sluggish fancy to move,
I might look for such tokens as this.

F. K. H.

NOTICE TO OUR READERS.

Last week, when the Alpine Philosopher was lecturing at Castle-street, it was objected to him that all the cures he had enumerated were performed abroad; and in consequence of this one of his patients, W. F., wrote us a letter, attesting the great and important benefit which he had derived from the magnetic treatment of our friend. He wished us to insert this letter in the *Shepherd*; but we consider that it would be imprudent in us to make the *Shepherd* a vehicle for testimonials of the kind. Those who want private information or satisfaction have the address of the tellurist. We have to do with the principle and the science only; and we hope our readers will give us credit for not showing countenance to anything which has not a host of evidence to substantiate its truth. Many years ago we have written favourably of animal magnetism, nor have we any authority to dispute the truth of the facts alleged; since even the first French commission, which condemned the science, candidly admitted the reality of the effects produced by the magnetists.

Many private letters had been sent to our office, addressed to the Alpine Philosopher, which we had to send either by messenger or post; and to save trouble and expense, he requested us to publish his address at the end of the paper, but the paper being filled up in that quarter, we squeezed it in at the end of his letter, without consideration. This we regret, for we wish the *Shepherd* to assume the character of a purely scientific paper, and to avoid as much as possible the air of individualism. Not that we think such a subject as animal magnetism is more than any other deserving of such an imputation as this; but the mercenary and deceptive character of the present age, and of the press in general, has created such suspicions in the public mind, that an honest and benevolent man cannot act with sincerity, from the pure impulse of a generous and enlightened nature, without being immediately assailed by the malignity, the jealousy, and the suspicion of those very men who boast of their superior liberality.

For the sake of our country readers, however, we may state that the Alpine Philosopher has been practising for three or four weeks with remarkable success; and such is the favourable testimony we have received of the effects of the manipulative system, that we have resolved to submit ourselves to its influence, having for twelve months past been very deficient in bodily health, to the great detriment of our private studies.

Next week we shall make a few remarks of our own upon the subject.

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 23rd inst., at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Brady, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 31.]

SATURDAY, MARCH 28, 1835.

[Price 1d.]

SYSTEM OF NATURE.

WE shall now, for the sake of embodying the great universal principles which we have been inculcating in this work, collect them together in as short a compass as possible. This we do as a sort of preparatory step to a compendium or summary of the doctrine of universalism, which we shall bring forth at a future period.

We carry our readers forward by little and little; "here a little and there a little;" not in that systematic and formal manner which we would have adopted had we been publishing a volume upon the subject, but administering only such gentle purges, or such nutritive aliments, as we thought our patients were able to bear. We know the prejudices we have to encounter, both in the religious and infidel world, and therefore we have judged it necessary to use such precautions as should not violently offend the extremes of either party; and we are happy to say, that we have succeeded at least in gaining the ear of both extremes, and picking up many eager and diligent readers of the *Shepherd* from the very ultras of both parties.

The first great and universal truth to which we call the attention of our readers is the unity of Nature.

I.

1. *The universe is one and indivisible.*

The meaning of this proposition is, that the whole universe is connected by one great uniting principle, or power: you may call it what you will—gravitation, attraction, chemical action, mind, or matter—we won't dispute with you about words,—they are but wind, as Dean Swift says, after all; and God and Nature are designated by as many different names as there are sects and opinions, dialects and languages, amongst men.

2. *The universe, though one and indivisible, contains within itself the spirit of antagonism, or action and reaction.*

This is what is called the bipolar principle, without which there could be no motion. Were it not for the centripetal and centrifugal forces in the solar system, there could be no revolution of the planets around the sun; without the centrifugal force, they would be attracted to the body of the sun; and without the centripetal, they would entirely abandon it, and fly off at a tangent from their orbits. These two forces are the bipolar principle of nature—the positive and negative.

3. *By means of these two principles, acting reciprocally upon each other, effects are produced, to which we give the names of solidity (matter) and motion.*

These three propositions constitute a general analysis of the universe. We now proceed a step farther, and specify two distinct phenomena in the universe, namely, matter and mind.

II.

4. *The most simple apparent (for it is not real) division of universal nature is that of power and matter.*

If matter consists of atoms, or particles, exercising an influence on each other, there must be a power between the particles which is not matter. Power and matter are conditionally distinct; notwithstanding, it may with propriety be said that power belongs unto matter, or is a property of matter; but it may with equal propriety be said that matter belongs unto power, or is a property of power. The existence of atoms cannot be demonstrated, but the existence of a universal power is self-evident.

5. *If matter be one thing, and power another, power is what is generally known by the name of spirit, or mind.*

6. *This power—spirit, or mind—is universal, infinite, eternal.*

If not universal, there must be some places in the universe where there is no motion, no weight, no pressure, hardness, action, or reaction.

7. *This power is intellectual, sensitive, conscious.*

If not, there could be no action and reaction; inasmuch as it is not by physical contact that motion is produced. The particles of matter do not touch each other, but they exercise an influence on each other, even as the sun and earth, which are a hundred millions of miles asunder, mutually affect each other. If not by physical contact, therefore, motion must be produced by metaphysical, that is, mental contact.

8. *Power, if either, is the original, inasmuch as it has the principle of action. Matter resolves itself into power, or is a spiritual compound.*

In other words, matter is one of the manifestations of the universal power. It is easier to conceive a time when there was no matter, than a time when there was no power; for if there was no power, matter could never move; but if there was power, it could generate matter.

9. *It is most reasonable to suppose that matter and power are coeternal.*

If not, then there was a time when power did not act, which is the same as saying there was no power at all. This is an absurdity, for it supposes an eternity of being, in which an active and inexhaustible power remained perfectly inactive.

10. *Power, being bipolar, or two-fold, communicates the same character to matter as its visible representative.*

Hence matter attracts and repels by virtue of the bipolar power. This causes the materialist to imagine that matter is the original existence; like the Protestant, he gives the ascendancy to the gross lump. The spiritualist, like the Catholic, gives the ascendancy to power. We

regard them as an infinite pair, spirit being male, and possessing the active nature; matter being female, taken out of the side of spirit, like Eve out of Adam, and possessing corresponding qualities, but of a passive nature; hence, the laws of the material and spiritual or mental world, bear a perfect analogy to each other.

III.

11. *Universal Nature being bipolar or sexual, particular or individual Nature is organised after the original model.*

Hence, plants and animals and chemical agents are all male and female, or positive and negative; in other words, "made in the image of God."

12. *The individual, or finite being, lives in the infinite, and the infinite in the finite.*

Hence, Universal Nature, or God, comprehends all existence, as Jesus Christ says—"I, father, am in thee, and thou in me;" for this reason we have two nervous systems, the voluntary and the involuntary; the former is moved by what we call our own individual will, the latter by the universal will; hence the actions of somnambulists, and the involuntary dreams and visions of the mind, are the immediate productions of the universal mind acting with the body, according to the unalterable laws of the bipolar power. Thus people foolishly talk of indigestion producing dreams and visions, and think they solve all difficulties in such a slovenly manner; even the Christians talk so, although, by this mode of reasoning, they reduce the God of the Bible, who wrought by dreams and visions, to a mere bodily disease or disorder of the stomach. What is disease but a principle of life, producing certain sensations of pain to the individual, but doing no injury to universal Nature? It is God in his character of painful experience. The actions of waking life are the union of God and man, or the involuntary and voluntary, the universal and individual Nature.

IV.

13. *In the progress of humanity towards a state of comparative perfection and ultimate enjoyment, evil is necessary to the production of good.*

This is evident from the simple fact that man must be ignorant before he is wise, and Evil is the natural child of Ignorance; in other words, man must fall, then rise again. In this simple truth is contained the doctrine of the fall and the redemption of man.

14. *God first leads men into error, and afterwards into truth.*

This not only corresponds with the history of all the sciences, which have always commenced in gross delusion, but with religion itself, and with the acknowledgment of all sacred and mystical writers, who represent God as blindfolding the world, until they have gained a certain amount of the experience of evil, to enable them to understand their own and universal nature: without this experience they would be irrational, i. e. brutes.

15. *The literal truth of any doctrine or system of religion cannot be demonstrated by prophecies, miracles, dreams, visions, or angelic missions, though these may demonstrate its divinity.*

This follows as a necessary corollary from the above, for divinity and truth are not synonymous. Thus Nature deceives us; and God himself says he sends us de-

lusions, with prophecies and miracles to confirm them. This is necessary to cultivate REASON, and ultimately enthrone it as the SON of MAN and Judge of all.

16. *The absurdity, falsehood, or cruelty of any temporary system, can never prove that it is not of God; and no eternal system can be absurd, false, or cruel.*

17. *The infidel, therefore, cannot confound the believer, nor the believer the infidel.*

18. *The same spirit which raises up, also destroys; hence Judaism was transformed to Christianity, and Christianity must evaporate into universalism.*

19. *Universalism is the doctrine of universal life, in opposition to atheism or universal death, in opposition to deism and every species of old religion, which are only atheism in disguise, inasmuch as they represent God as distinct from Nature, and Nature going on without the interference of God.*

If any portion of Nature can act without God, why not the whole? The man who acknowledges or maintains that any occurrence which takes place is not of God, is an atheist in the tendency of his principles; so are all the disciples of the old world; they are the sons of Atheism; they know not God; God is universal Being—Jehovah—I am—the living God.

Let our readers chew the cud upon these propositions.

THE SHEPHERD.

LETTERS ON TELLURISM, COMMONLY CALLED ANIMAL MAGNETISM.

LETTER XIII.

"Ante omnia sciendum est quod sit quaedam, inter celestia atque terrestria, inter ipsa elementa simplicia, sympathia et antipathia, quoddam odium et amicitia."—FLUDD.

Before every thing, you must know that there exists a kind of sympathy and antipathy, of hatred and love, between the heavenly and the terrestrial bodies; indeed, between the simple elements themselves.

TELLURISM may be considered under a twofold aspect; namely, as the science of the fundamental laws of Nature, or as the application of this science to the purposes of maintaining and prolonging, or restoring, health.

To-day we shall take a review of the application of tellurism to these important objects.

If health be the harmony of the principles of life, it is evident that none can obtain this desideratum, but he who has acquired the knowledge of the action and reaction, sympathy and antipathy, of the heavenly and terrestrial bodies, and of the elements. Astrology, physiology, natural philosophy, and chemistry, form parts of this science, which is the living or uniting principle of them all.

But, alas! what avails all knowledge, when the whole of mankind seems to conspire against the possibility of putting it into practice! The whole frame of society, by day and by night, counteracts the wise plans of Nature: Our mode of living and working; our food, our drink, our mode of dressing; all our arrangements are a continual reversion of the dictates of reason.

Eight parts out of ten among the inhabitants of London, for instance, over-work themselves, and destroy their constitution by unwholesome food, poisonous drinks, and filthy habits. There are in this wide metropolis no

warm baths for the middling and lower classes; and such is the want of care which they themselves show for health, that some pledge from week to week their Sunday apparel to procure unwholesome beverages; others deprive themselves of wholesome food to get showy dresses, or to frequent the playhouses; and none think for a moment of sparing a trifle to procure for themselves and for their children the benefits of bathing!

Envy, anxiety, and rivalry, engender passions which act worse than arsenic upon the human frame. Nervous diseases, consumptions, liver complaints, and many of the disorders which afflict the fair sex, are caused either by their *undress*, or by the fashionable folly of compressing their chest, lungs, and other noble organs, in that satanic contrivance called *stays*.

Instead of procuring digestion by exercise and a proper diet, the digestive power is impaired by intemperance and by purgatives.

Nature has appointed the great luminary to call us to our labours, and has spread over us the veil of night to invite us to rest. We have reversed this order; and we sleep away the best part of the day, in order to revel beyond the midnight hour.

The tellurist, in order to remedy these evils, demands new social arrangements. He does not trouble himself about names, and forms of governments—he knows that all these forms are but deceptions. He claims an order of things suitable to the happiness of all the members of the human family. Even as the one sun shines over all plants, or as the elements give their mite towards the sustenance of all living beings, to each according to its wants and functions; even so the products of the earth, the necessities of life and health, ought to be rationally distributed among the human race.

What should we say if a gardener should water but a few plants in his nursery, leaving the many to wither from want of water; or if he should only cultivate the few that bring no fruit, and leave the others, that bear the choicest fruits, exposed to all the inclemencies of the sky, and to the native barrenness of a sandy soil? But do the governors of the family of mankind act otherwise?

The many are either starving or suffering for want of proper arrangements; the few are pampered in luxuriant plenty.

Yet nature avenges these wrongs. The most loathsome diseases pay no respect to the enclosures of the rich. They cannot be fenced off from the palaces and villas of the rich, like ragged misery. They enter amidst the noisy routs and the pompous banquets; and gout, tic douloureux, migraine, scrofula, consumption, mental disease, dropsy, and other loathsome disorders, do not spare those who boast of princely blood, or millions of hoarded pelf.

To prolong life, to maintain health, is, under these circumstances, to demand impossibilities. The tellurist must then, for the present generation, confine himself to the most arduous task, which is to conquer diseases.

Yet not all diseases will obey his magic spell. Sometimes he is obliged to have recourse to the problematic, fallacious administration of drugs. However, in this department he will never poison his patients. The heroic

powerful medicines are entirely banished from his treatment. His maxim is rather to allow nature to work by itself, than to dare to bring about violent revolutions in the human frame.

But for some diseases tellurism is the only sure and certain remedy. All nervous diseases, even those which affect the mind, or impair the use of the organs of sensation, are absolutely under his control.

In such diseases, if they are not of long standing; if nature has not entirely been killed by previous ill-treatment, the cure is certain. In those of long standing, and those in which medical skill has been useless, the only hope of recovery, or at least of improvement, is afforded in tellurism.

Equally powerful and certain is the cure of all recent diseases which depend on obstructions, hemorrhages, or suppressions of periodical evacuations; in short, in all diseases known under the name of female complaints, in scrofula, and the many disorders depending on it.

In all chronic and complicated diseases, tellurism can be of paramount utility, particularly if its influence can produce somnambulism.

Some great authors have recommended this treatment in acute diseases, even in incipient consumption, and pleurisy, and fevers. The Alpine Philosopher, however, does not agree with them. Either the natural course of the disease is slow; in this case magnetism, by giving more energy to the whole system, can accelerate the course of the disease. In the contrary case, the action of magnetism being generally slow, it is unable to check the natural rapidity of the disease.

The Alpine Philosopher has now under his treatment a great number of cases of nervous and other disorders, subjected to the influence of the telluric power, the result of which he will make known to the public as soon as possible. With few exceptions, all his patients are long sufferers, and their diseases have been treated for several years without success by the most eminent men; wherefore his trial is the unfairest in the world. He has not only to battle against the disorders of nature, but also against the failures and mistakes of the doctors. Yet upon the whole he is sure that the results will be favourable.

And now, farewell, gentle reader! Whilst thundering against the disorders brought on by thwarting nature, the preacher himself has proved to be the greatest sinner. He has been obliged to borrow from the lamp the light that enables him to write these lines. It is three o'clock—past midnight. Gentle reader, farewell!

THE ALPINE PHILOSOPHER.

REVOLUTION OF PHILOSOPHY.

By R. WHALLEY. Published by Heywood, Manchester.

THIS is the production of a man who glories in the name of atheist, and uses all the arguments he can muster to prove that there is no universal intelligence in Nature; that the source of intelligence is not intellectual, the source of life is not alive, and the source of sensation not sensitive; that chaos rules the universe; that there is no plan, no system, no design, no ultimate

purpose or end in view. It is a perfect specimen of dead materialism.

The book seems to have been written expressly on purpose to prove the doctrine of *universal death*, with the exception of the animalcules, which we call men and brutes; who have been brought into being by what the author calls "*circumstances*," a most convenient word for puzzling a jury; but he seems to have forgotten that there are different kinds of circumstances, and especially "*intellectual circumstances*." "There is no such thing as a universal intelligence," he says, "*because intelligence is the result of ideas*." Is it not also the cause of ideas? "There is no such thing as a being endowed with infinite goodness, wisdom, and power." Why? because of the existence of moral evil, says our author; and he is so simple as to imagine that this stale argument is brought forward by himself for the first time! There never was an atheist since time began who did not use it. He says, if a universal spirit existed, there could be no space! if no space, no motion! and moreover, there can be no universal spirit, "*because modern chemistry proves to a demonstration that all existing substance is originally and essentially the same*." But modern chemistry cannot determine whether that substance is spirit or matter; for notwithstanding all that our author says about atoms, he cannot demonstrate the existence of one of them; and when he has demonstrated their existence, he has only demonstrated the fallacy of his own reasoning; for if matter consists of atoms, the space between them must consist of power to move the atoms, and what is power but spirit?

"Nature," he says, page 26, "is not a substance;" and in page 33, he says "Whatever does exist must be a substance at all events;" consequently there is no such thing as nature: this is infidelity with a vengeance! However, he says that every sensible person knows "that *matter exists*," and that is quite enough for a materialist. He says that this matter has six properties, but "these properties are not *natural* properties, not produced by nature; not circumstantial, but necessarily existing—coeternal with the atoms."

"Nature is not a substance of any kind, but the aggregate of powers, properties, or qualities which arise from substance." He might as well have said Nature is not God, but the aggregate of powers, properties, or qualities which arise from God.

"Matter moves of itself, by virtue of the difference of bulk or configuration of the atoms."—"Heterogeneity is in general the cause of motion;" but how one atom knows that another atom is of a different sex, species, or form, he informs us not; and experience certainly does not show that difference of form produces motion.

After attempting to reduce all nature to a system of universal death and infinite stupidity, he then informs us how this infinitely stupid mass or congeries of atoms conglomerated together and made the sun, whilst other atoms, equally stupid, but of a darker and more opaque nature (*nebulosities*), held also public meetings, and created the planets, satellites, and comets. After that, this huge lubberly mass of uncreated idiots (atoms), not content with their state of unconsciousness, or rather

without being able to act otherwise, arranged themselves by certain ramifications into certain forms, and produced vegetables, and animals, &c., and thus individual consciousness and intelligence began. Before this took place the earth was at one time in a sort of puddle, or mud, and the heterogeneity of the elements produced a strong intestine heat, which caused evaporation and solidity by degrees. During this process the various elements of oxygen, hydrogen, carbon, &c., must have met and combined with each other in every possible variable proportion, and therefore *could not possibly fail* of producing organic forms, both animal and vegetable. They could not possibly fail; but you must give the puddle credit for not having the least intention to create men, beasts, and fishes. The creation of these beings only took place by "*circumstances*." It could not possibly fail to take place. When a man arose out of the puddle, a woman could not possibly fail to follow him. It is natural for women to follow men. If a woman arose first, a man could not possibly fail to come after. It is natural for men to follow women. And it is quite as clear that those two must be sexually organised and fitted for each other by the law of infinite and eternal stupidity, which is the universal law of atheistical nature. In fine, Nature, according to this zealous materialist, is an infinite, eternal, unteachable, and brainless blockhead, puffing and blowing, and rolling, and clashing, and blundering, and mangling, with unwearied activity; but, by a fortunate combination of circumstances, occasionally bringing forth an infinitely complicated piece of living and intellectual machinery, which machinery, by a still more fortunate combination of circumstances, is always male and female, and capable of bringing forth its own likeness for ever, under the divine, and unconscious, and unintellectual providence of unfathomable ignorance and heterogeneity.

Well, admitting all this to be true, what can the author make of it? His chief aim is to enlighten the world, and consequently to destroy all religions, all ideas of a God, and all hope of a future state. But how can his system effect this? He does not inform us; for it is quite as possible for heterogeneity to produce invisible material beings (such as angels, ghosts, goblins, and fairies) as visible ones; and it is quite as possible for heterogeneity to prolong our existence in the solar or invisible world, as to bring us into telluric existence; and it is quite as possible for heterogeneity to prophesy and make revelations, by means of visions and audible voices, from unknown causes, as it is to produce sensation, volition, and judgment, and therefore it by no means follows from the author's system that religions are false; for even their confusion, contradiction, and chaos are an insurmountable argument in their favour, and show that the great principle of heterogeneity has been at work amongst them, and therefore *could not possibly fail* of bringing forth truth, both in prophecy, doctrine, and miracle; for as the elements of oxygen and hydrogen, &c., in the material puddle, *could not possibly fail* of producing men and women; upon the same principle, the elements of mysticism in the intellectual puddle of the human mind *could not possibly fail* of bringing forth a

divine revelation of futurity; nay, could not possibly fail of producing such a man as Jesus Christ, not a doer of miracles, but only a doer of works which required a little more than common of the principle of "heterogeneity." In fine, we think this doctrine of heterogeneity agrees in every respect with the doctrines of Christianity; but the author, from some aversion to the priests, which he himself knows best how to account for, seems bent against this charitable and liberal application of his system.

The book itself is a curiosity. The author is evidently a diligent and thinking man, fond of knowledge, and eager in its acquisition; his motives are, no doubt, good, and we have not the slightest doubt that he is thoroughly convinced that his views of nature are necessary for the regeneration of society. But we are pretty sure that human nature will resist for ever the philosophy of universal death. It is a species of suicide, a moral and intellectual suicide, and it is not more wonderful that some should be guilty of it than that some should be guilty of physical suicide; but these "some" are and ever will be rarities and exceptions to the bulk of humanity.

The author terms his work the Revolution of Philosophy; but it is only the old French materialism, which is far beyond its prime, and is fast decaying. The French themselves are rapidly deserting it; but it is quite in accordance with the doctrine of progress that it should make its last effort in Manchester, which is the end of the line of progress westward, and the great emporium of mechanical philosophy, alias materialism. In London we believe it is past its meridian. It gives no satisfaction; it is a chaos of facts, a sort of sand-bed, whose particles may lie well enough together if not disturbed, but the least puff of wind will scatter them abroad.

As for this philosophy of atoms, it is a mere superstition; there is no such thing as an atom. It is only the creature of the fantastic and whirling brain of the materialist. Matter is merely the principle of repulsion or solidity in the infinite mind, the negative or female spirit of universal Deity, which unites with the male in an infinite variety of modes and degrees, and produces a corresponding variety of forms and organisations. It is all resolvable into pure spirit, or mind; yet still it has a real existence, inasmuch as it is mind itself, or a peculiar manifestation of mind, just as ice is a manifestation of gas. Young has very correctly described the universe of the materialist as a "universe of dust;" and how that dust contrives to move without an immaterial power between the particles, neither Whalley nor his school have ever pretended to describe.

TO THE EDITOR.

DEAR SHEPHERD,—As you are not one of those who reject authority entirely,—allowing it its due weight, but no more than its due weight,—I send you chapter and verse from the writings of a great modern, as a make-weight to the facts adduced by the Alpine Philosopher from his own experience—if they require any make-weight. My author is Gottfried Reinhold Treviranus, one of the greatest, if not the greatest name, among mo-

dern physiologists; and the passage is translated from his *Biologie*, vol. v., p. 392. Gottingen, 1818.

March 13, 1835.

NO BARKER.

TRANSLATION FROM TREVIRANUS.

"It is known (from Pechlin's reports among others) that the influence of certain touchings by one human being of another has been observed. Mesmer seems to have been the first who discovered that this influence principally exerts itself when the person to be magnetised is stroked with the hands, by the manipulator, from the forehead down towards the peripherous ends of the nerves. This passing along of the hands is more effective than simply touching on isolated spots. In cases in which a strong predisposition for animal magnetism exists, the very imposition of hands, or even the mere living together of certain persons, can produce all the phenomena of somnambulism. I have had a case, in which a young girl of seventeen years of age, in all other respects sound and strong, was suddenly seized, in the period of her menstruations, with spasmodic attacks, and fell by degrees into somnambulism of the highest degree, for eight days uninterruptedly, without my having attempted to do more than pass the flat of my hand over her nerves once each time, and that only for a few days during the commencement of her illness. But still somnambulism is but a rare effect of magnetism. Usually, after the applications of the magnetic treatment, follow fever symptoms, during which certain evacuations that had been suppressed, particularly the monthly ones, resume their course."

TO THE EDITOR OF THE SHEPHERD.

SIR,—Agreeably to my promise, I have sent another trifle from H. C. J., being a few hypotheses drawn up in favour of the human soul's existence, (independent of the books called divine revelation,) and likewise an auxiliary to the articles of rational faith that appeared in the *Shepherd* of Saturday, March 7.

Hypotheses to prove the human soul's future existence.

1. That as organisation of whatever kind is equally within the power of the deity, that of spirit must of force be so; and that, from the subtlety and activity of its component parts, it must, when organised, be of all others the most coercive.
2. That, from the well-known properties of air, such a spiritual agent would be capable of contraction or dilatation to any conceivable degree.
3. That, from our experimental knowledge of heat and light, its pervasive and dissolvent powers would literally have no limits but such as were assigned it by the eternal organiser.
4. That from the astonishing velocity of the sun's rays, its activity may be fully conceived.
5. That from the possible reduction of almost every substance to vapour, or gas, and from the indispensable necessity of that spirit we call air, in the process of all animal and vegetable assimilation and accretion, it appears highly probable that both spirit and matter are in a mutual and constant state of conversion each to other.
6. That the same assimilative power which can, both in the animal and vegetable species, increase a scarcely visible embryo to the enormous volume of the cedar, or the leviathan, sufficiently suggests the impartability of such a power to a spiritual agent as should enable it, by a like assimilation, either to increase or contract its figure to whatever astonishing and irresistible dimensions its creator might be pleased to restrict it.

That all this is possible, no man who philosophically contemplates the many permanent wonders of nature will hesitate one moment to believe. Therefore, its essence proves a divine power, and the human soul's existence. And, as analogy is, in the solution of mathematical problems, not barely admissible, but often conclusive, I have drawn the aforesaid inferences from analogical comparisons; but, as every man is not a philosopher, I will endeavour to elucidate and exemplify some of the articles of this hypothesis.

That the solidity of any substance we are acquainted with is no impediment to its convertibility into spirit, is sufficiently exemplified in the reduction of gold to such tenuity as to rise in vapour or gas in the alembic, or by its mere solution in its own dissolvent, where the precipitate becomes (from saturation with the nitrous acid) far more inflammable and explosive than even gunpowder itself; that this is again reducible to its metallic state, is but a corroborative of the fifth article of these hypotheses. And that the hardest substances are equally reducible to spirit, has, by the late experiments on the inflammability of the diamond, been placed beyond a doubt. Nay more, they have been proved to consist of a phlogiston, so entirely pure and penetrative, as totally to pervade the pores even of glass, and, in one sense, to exceed in subtilty the particles even of light—the glass through which it was evaporated being opaque.

To object, that an organised and animated spirit, composed of such materials, would, by its combustible active qualities, be applicable only to irresistible and immediate destruction, will be of but slight availment to the pertinacious ingenuity of the sceptic. A spirit equally active, forcible, and pervasive, is not only producible by the most simple process of the electrician, but it is with the like facility conveyable into our bodies, which for any given time may serve it as a common conduit, with such perfect security and inoffensiveness as even to elude all consciousness of its being there. H. C. J.

ON PRAYER.

Why should we pray to God most high,
Omniscient Lord of earth and sky?
Our ev'ry want does he not know?
Or are his kind compassions slow?
Must we then importune and tease,
And cringe, and fawn, before we please?
Can God enjoy the groan, the tear,
Fit only for the despot's ear?
To God our wants why should we tell,
When we are sure he knows them well?
To grant them, will he still delay,
Unless we sigh, and groan, and pray?
If God be so supremely kind,
Unchangeable in deed and mind,
Why vainly, impiously, try
To change the monarch of the sky?
The Jew, he prays that God would bless
His chosen people with his grace.
He prays that Israel's seed, may be
As sands encircling yonder sea;
That Christians who have gone astray,
And wander'd in a dangerous way,
May all to Jacob's God return,
And deeply their transgressions mourn.
Then Jacob's God will take them in,
And purge them from their deadly sin.
The Turk devoutly, humbly cries
Before the Ruler of the skies;

That God is one, and great 's his view,
And Mahomet his prophet true.
He prays that God this faith would spread,
And make the Alcoran be read;
The world its sacred truths embrace,
Or perish all the sceptic race.
The Hindoo and the Brahmin pray
That all may of the Shaster say,
"Thou art alone the book divine,
In which true faith and doctrine shine."
Our king, our nobles, clergy, pray
That God our enemies may slay;
Whilst Frenchmen and their clergy cry,
That Britons may from Frenchmen fly.
Good Catholics sincerely pray
Their Holy Church may win its way;
That heretics of every nation
Believe in transubstantiation.
Whilst Protestants the Lord implore,
That he would slay the Scarlet Whore,
And end her horrid, barbarous reign,
Of deeds of blood, and martyrs slain.
All godly, pious people pray
The Lord to keep them in his way;
Lest he their welfare should forget,
Or at their silence take the pet.
Now all these fervent, holy prayers
Enter the great Jehovah's ears.
To grant them all, were he to try,
Would puzzle the Ruler of the sky.
If we our various duties do,
Love justice, wickedness eschew,
The God of justice and of love
Such conduct surely will approve.
Is he not humblest, wisest, best,
Who lets the Sovereign Ruler rest?
Who thinks his plans so wise, so high,
That he can't mend them if he try?

A NORTH WIND.

[True prayer is faith in the wisdom and providence of God. Therefore the Apostle says "Pray always; pray without ceasing." That is, live in confidence, and repose upon the Universal Mind.—ED.]

MADEMOISELLE SALIGNAC,

Of Xaintonge, lost her sight when only two years old, her mother having been advised to lay pigeons' blood on her eyes, to preserve them in the small-pox; whereas, so far from answering the end, it eat into them: Nature, however, may be said to have compensated for that unhappy mistake, by beauty of person, sweetness of temper, vivacity of genius, quickness of conception, and many talents which certainly much softened her misfortune. She played at revertis without any direction, and often faster than others of the party: she first prepared the two packs allotted to her, picking them in several parts, yet so imperceptibly that the closest inspection could scarcely discover her indexes; every party she altered them, and they were known only to her: she sorted the suits, and arranged the cards in their proper sequence, with the same precision, and nearly the same facility, as they who have their sight. All she required of those who played with her was to name every card as it was played; and these she retained so exactly, that she performed some notable strokes at revertis, such as showed a great combination and strong memory. A very wonderful circumstance was, that she learned to read and write; for she regularly corresponded with her elder brother, whom some mercantile affairs had called to Bour-

deaux; from her hand he received an exact account of every thing that concerned them. The mode adopted by her friends in writing to her was to use no ink, but the letters were pricked down on the paper; and, by the delicacy of her touch, feeling each letter, she followed them successively, and read every word with her fingers' ends. A person scratched, with the point of a pair of scissors, on a card, *Mademoiselle de Salignac est forte amiable*; she fluently read it, yet the letters were small, and very ill-shaped. In writing, she made use of a pencil, as she could not know when her pen was dry; her guide on the paper was a small thin ruler of the breadth of her writing. On finishing a letter, she wetted it, which fixed the traces of the pencil, so that they were not obscured or effaced; then she proceeded to fold and seal it, and write the direction, all by her own address, and without the assistance of any other person. Her writing was very straight, well cut, and the spelling no less correct. To reach this singular mechanism required such a subject, and the indefatigable cares of her mother, who, accustoming her daughter to feel letters cut out on cards or pasteboard, brought her to distinguish an A from a B, and thus the whole alphabet, and afterwards to spell words, then, by the remembrance of the shape of the letters, to delineate them on paper; and lastly, to arrange them, so as to form words and sentences. She learnt, and almost by herself, to play on the guitar, sufficiently for her little companions to dance by, and had even contrived a way of pricking down her tunes as an assistance to her memory; but, being at Paris with her father and mother, a music-master taught her in the common method, observing the way used in writing to the young lady by pricking, and, to distinguish the whites, they were made larger. She learnt to sing; and so acute were her organs, that in singing a tune, though new to her, she was able to name the notes for them to be pricked down whilst singing; she even told the movement of them. In figure dances, she acquitted herself extremely well; and, in a minuet, with inimitable ease and gracefulness. She was very clever in the works of her sex, having made a silk and silver purse, wrought in knotted points on a wooden mould. She sewed perfectly well; and, in her works, she threaded her needles for herself, however small. She never failed telling, by the touch, the exact hour and minute by her watch.

PRINTING.

BEFORE the art of printing, books were of incredible price. From the sixth to the thirteenth century many bishops could not read, and kings were scarcely able to sign their names; and hence the use of seals and sealing. These were the ages in which superstition, witchcraft, and priestcraft obtained so universal an ascendancy. From 500 to 1200, all learning was in the hands of the Arabs, Saracens, and Chinese.

Copying was, in Greece and Rome, a productive employment; but it afterwards fell into the hands of the monks, who copied chiefly theology.

A good copy of the Bible, on vellum, employed two years, and the works of either of the fathers still more time. Jerome states, that he had ruined himself in buying a copy of the works of Origen. Of course, copiers altered and vitiated, corrected the language, interpolated, &c., according to their honesty, taste, faith, or party; and hence the endless controversies among critics and theologians about words, phrases, and paragraphs. It thus appeared that, at the Council of Nice, in 325, there were two hundred varied versions of the adopted Evan-

gelists, and fifty-four several Gospels preserved in various Christian communities, but so scarce that no Roman historian or writer appeared to have seen any of them.

Some writers give the invention of printing to Gutenberg, of Mayence; while others ascribe it to Faust, (often called Dr. Faustus), of the same city; and others, to Lawrence Koster, of Haerlem. The copyists made so great a clamour, that the parliament of Paris at first, to oblige them, caused all printed books to be seized.

The first printed books were trifling hymns and psalters, with images of saints, and, being printed only on one side, the leaves were pasted back to back. One of the first was the *Biblia Pauperum*, of forty leaves, which, pasted together, made twenty. An entire Psalter was printed, in 1457, by Faust and Schoiffer; and a Bible, in six hundred and thirty-seven leaves, in moveable types, was printed at Mentz, between 1450 and 1455; but the most important part of the invention (that of moveable types) is uncertain, both as to name and date. The first characters were Gothic; and Roman type was first used in 1467.

Printing by blocks was an extension of the art of seal-engraving, which had been carried to great perfection in broad seals. The first printed sheets were worked only on one side the paper, and the impressions produced by a plane and mallet. The ordinary printing press was first made by Bleau, at Amsterdam; in England, the first types were cast by Caslon, in 1720. The printing-machine was first suggested by Nicholson, in 1790, and perfected by Koenig. Stereotype printing was used in Holland, during the last century. The rollers for inking the types was the suggestion also of Nicholson. Stereotype printing was introduced into London, by Wilson, in 1804. The last-adopted improvements have been the Stanhope press, and the Columbian press.

Caxton was the first English printer, and his printing-office was in the Chapter-house of Westminster Abbey. He learnt the art in Germany, and was liberally patronised in England. The first book printed by Caxton was in 1471, and bore for its title, "*Willyam Caxton's Recuyel of the Histories of Troy, by Raoul le Fevre.*" While the *Bibliomania* prevailed, a copy was knocked down, by auction, for 1060*l.* 18*s.*—*Million of Facts.*

TO OUR READERS.

According to promise we give a few remarks on the subject of the Alpine Philosopher's letters, which he has now finished, although he does not mean to forsake the *Shepherd*, but to give us occasional disquisitions on other interesting physiological subjects. We prefer the name of Human Magnetism to that of Tellurism, inasmuch as it is more expressive, and conveys a clear idea of the nature of the operation; but even this epithet is itself defective, inasmuch as the metallic magnetism is sometimes employed to facilitate the operation. But the manipulative department ought always to be distinguished by the name of Human Magnetism alone.

Since we last addressed our Readers, we have for the first time witnessed a case of somnambulism, in a young woman, a patient of our friend's, who was so ill at the commencement of last week that she could not leave her home, and is now, according to her own testimony, out of the list of invalids. On the fifth day she was thrown into the crisis, and spoke with difficulty; saying she would be better on Sunday at six o'clock. At that hour we went to the Doctor's house, and witnessed the treatment from the commencement. The patient heaved con-

siderably with her breast, waved her head and rolled her eyes, and called twice for magnetic water, of which she drank freely, and in less than ten minutes she was fast asleep. The Doctor asked if she would see any of his patients. She said she had no objection, but did not think she could say much. One woman was brought in who is paralysed on one side, and has lost the use of speech. The somnambulist took hold of her hand, and asked, "what is wrong with this woman?" The Doctor said, "Paralysed." "Oh, I see! Ah! you'll get better; I know you'll get better." She was asked when. She replied, "Two months; you'll recover the use of your speech." Another patient then silently took hold of her hand, and she said, "Whose hand is this—a gentleman? He has got a nervous complaint. You also will get better," &c. This is the substance, though not all the particulars, of what we saw and heard. The woman's husband was present at the operation, and confessed he had always ridiculed the subject till he had seen it verified.

This ocular testimony does not strengthen our faith in the science, which is too reasonable, when candidly examined, to be entirely rejected; although, at the same time, we are not disposed to give it such an exclusive share of our attachment as entirely to supersede the use of other medical treatment. We are universalists, and believe in the efficacy of both physical and metaphysical treatment; both external and internal applications; both gentle nervous excitement, and active vigorous muscular exercise; but each of these remedies ought to be used on their own proper occasions, and therefore the professors of the healing art ought to be intimately acquainted with the properties of each. Our present physicians are mere materialists, and therefore their science is merely experimental, and in many cases destructive of life and health.

Human Magnetism is strong or weak, in proportion to the irritability of the nervous system. A person exhausted with disease is more susceptible than a convalescent; but a person naturally nervous and sensitive is always easily affected by the treatment. This circumstance has caused the sneering materialists of the old school to raise their usual cry of "Imagination!" as if this despised and persecuted faculty of the human mind was quite sufficient to destroy the respectability of every science with which it is connected. But what is this imagination, but sensitiveness? and what is sensitiveness, but susceptibility of impression? and what is susceptibility of impression, but common feeling, which always operates by means of the nervous system? Consequently pleasure and pain are imagination, because they are nervous excitement, and, according to the reasoning of our wise materialists, must be both a delusion.

It matters not to us whether the physis be solid matter or mere imagination, provided it be effective: when effective, it is *real*; when not effective, it is merely imaginative, even though administered in a regular bolus of purgative materialism; and every physician, skilled in his art ought to enquire and to know to which of these two species of medicines he ought to resort, and in what manner they may be most beneficially applied.

All men seem to imagine that there is a line of distinction between mental and bodily medicine, and that a drug is of the latter description. There is no bodily medicine, strictly speaking. It is all mental, because it cannot operate upon a *dead* man. But there is a positive and a negative medicine. The positive acts directly upon the mind, by the nerves of volition; and the negative, such as pills, powders, &c., acts directly upon the mind by the involuntary nerves. The old medical science confines itself exclusively to the latter; magnetism employs the former, but does not exclude the latter;

it insists upon the necessity of a *revolution in medicine*, by giving the ascendancy to the positive over the negative treatment.

Our readers are not at all aware of the importance attachable to this question, in bringing about an important physiological reformation; but we shall not press them too hard at present, but conclude with a few remarks from Francis Corbaux, Esq., of Winchelsea, a magnetist, who published, in 1819, a translation of a work on the Sentient Faculty, by the Count de Redern, in which the Count makes frequent allusion to magnetism. Corbaux himself was (perhaps is) a magnetical practitioner. After giving an account of the abuses of the science by men of vain pretensions, and of the manner in which it was first introduced into England by Dr. Demainauduc, who destroyed its respectability by the air of mystery and secrecy under which he veiled it, Mr. Corbaux writes as follows:

"Partly from exaggerated pretensions in the early magnetists, and partly from some mistaken notion of injury to the medical interest, the body of medical men in England have long resisted the invitation to take the magnetic practice into their own hands, which would unquestionably have been the better course. They now labour under the unconquerable difficulty of openly retracting an opinion once inconsiderately maintained. The far greater number are still destitute of information upon the subject, but not the less reluctant to confess ignorance. Among the most eminent of that profession, many choose to remain silent, though now convinced of the reality of the magnetic action, and of its sanitary properties; whilst many others conceive themselves too old, either to learn, or, what is yet more repugnant, to *unlearn*; and some, more liberally disposed, are prevented by apathy only from venturing beyond the pale of classical systems, awaiting some new and extraneous impulsion. It is therefore too late to expect that the important benefits of human magnetism will be proclaimed through the instrumentality of a class of men by whom Harvey and Jenner have been persecuted and reviled. It is through the medium of the public, only, that conviction can now be brought home to them, and the spirit of intolerance be put to shame."

CORRESPONDENTS.

A. D. must remember we are not responsible for the opinions of correspondents, nor extracts.

We have not room to answer W. L. this week.

The articles on Astrology we did not mean to continue; but if our correspondents at Woolwich have any enquiries to make, they may send them. We admire the principles of the science.

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 30th inst., at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Bready, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 32.]

SATURDAY, APRIL 4, 1835.

[Price 1d.

SYSTEM OF NATURE.

LAST week we gave a general outline of the doctrine of universalism; an outline which agrees both with science and revelation, and on that account well calculated to form a conciliatory medium of intercourse between the contending extremes of society. But we do not flatter ourselves with very sanguine expectations at present. Some new stimulus must be given to the public mind before it can devote its attention to subjects of such general and all-engrossing interest.

We shall give a more perfect and comprehensive compend of the system at a future period, when our readers have well-digested the first nineteen propositions; and, in the meanwhile we shall shortly discuss the important question—What is the moral law of God and Nature?

Of all the institutions of Moses, the moral law is the only portion which has survived the wreck of spiritualization: the rest have been metamorphosed into types and allegories, shadows, and such like visionary and temporary vanities; but the moral law is considered binding at this very day. This is of itself a type, to show us that the moral law of Nature alone is eternal and imperishable. It runs down through the course of time, and survives the overthrow of all mystic ceremonies. And what is this moral law? and is it also not capable of refinement as well as the rest, and destined to assume a new and more spiritual character as the progress of civilization advances?

Yes; this also is changed as well as the rest; but the epoch of its change is the commencement of the new world, and the termination of the old. The moral law of the ten commandments is an eternal and perfect law; and as long as the present system of society lasts, it ought to be enforced in its literal and most obvious sense. Whilst exclusiveness and individuality of property and interest continue, all the restrictions of the moral law are necessary to preserve the order and keep up the spirit of industry in the world. Were it literally kept even now, there would be little of that sectarian rancour and animosity experienced, which desecrate the temples dedicated to God, and consecrated for the purposes of moralizing the people. The breach of the second commandment has been the main source of all the religious divisions of the human mind. The local gods, the personified gods, the images, whether dead or alive, of wood, of stone, or of flesh and bone, or of pure spirit, all on account of their partial and finite character, as comprehending merely a part, and not the whole of existence, are the chief reason why men now abhor and persecute each

other, because the objects of their respective worships happen to be different. Who is it that does not break the second commandment? Is it the Christian? He worships the image of God. Is it the deist? He worships only the spirit of Nature, abstract from Nature itself. Is it the infidel? He worships Nature alone, abstract from the spirit that gives it life, and organizes the universal fabric in whole or in part. It is the universalist alone who keeps the second commandment; for he alone refrains from rendering into separate parts the infinite and indivisible God.

The observance of the fourth commandment is as necessary for the peace of society as that of the other. One day of rest out of seven is not too much either for man or for beast. The Sabbath ought to be celebrated as a day of universal repose for all the sons and daughters of industry. It is not enough to make legislative enactments to force the poor from pursuing such employments as may be essentially necessary for supplying their natural wants, or to make restrictive laws against travellers and coach-drivers. This is merely abusing the spirit of morality by a hypocritical pretence of keeping the letter of the commandment. If the spirit of the commandment be despised by those in whose power it lies to recommend and establish the practical obedience by their example alone, no tyrannical system of police administration, in curtailing the liberty, and restraining the provident industry of the poor, can ever produce any other effect than that of desecration and irreverence on the part of the people. The commandment is simple: Do no work, thou, nor thy son, nor thy daughter, thy man-servant, nor thy maid-servant. Nothing can be more intelligible, and nothing more reasonable; and nothing, at the same time, is more evident than this, that the commandment has never yet been kept. It must be kept, however; and the very ignorance, bigotry, and intolerance of the fanatical Sabbath-bill law-makers will ultimately bring forth a voluntary emancipation of the domestic slave from the reluctant hands of the masters and mistresses of super-vulgar life, who now deign not to soil even one of their fingers in performing the simple duty of merely serving themselves.

A Sabbath bill can never be put into execution, according to the letter of those sectarian fire-brands, whose spirituality exhibits itself in anything but the spirit of the commandment they profess to revere. Let them dismiss their servants on a Sunday; let them persuade or insist upon the rest of the aristocracy doing the same; let them give leisure to their horses, and condescend to lower themselves for one day of the week to a level with the

rest of mankind; cook their own food, and brush their own shoes, and do any other menial office which their own bodily comfort requires; and there can be little doubt that the inferior gentry and middle classes will voluntarily follow their example, and universal relief will be obtained for all, according to the spirit of the precept. All this might be effected without any legislation. Custom and public opinion are more powerful than law; fashion is superior to an act of parliament; and there is quite as much good sense yet left behind in the people of England as to convince them at once of the justice and expediency of such a day of release. This, which is actually the true method of keeping the Sabbath, would be considered sacrilege and impiety by the Sabbath-bill gentlemen, and the disciples of the old school of sanctification. They keep their servants at work to prevent them from amusing themselves in the fields, or gossiping with one another; the latter evil being supposed much greater than the former, although the commandment never once alludes to it: they consider themselves divinely authorised to commit a flagrant breach of a positive statute, in order to withhold the opportunity of committing a breach of an imaginary statute.

It was by such twisting and commenting as this that the Roman Catholics of old got rid of the obstacles which the second commandment cast in the way of their images and idolatrous worship. There is no obstacle too great for a priest, no troop too formidable, no wall too high. "By thee," says David, "I have run through a troop, and by my God I have leaped over a wall." David is but a sample of all the rest; they have all been admirable leapers. If the spirit of a commandment is any way troublesome to keep, or revolting to flesh and blood, they make a spring by the grace of God assisting them, and leap over it in a twinkling, and soothe their conscience by paying due deference to the letter of the commandment. If, however, the letter be troublesome, it requires only another spring, and over they go, their wit never failing them for a suitable excuse and a learned apology, from the practice of the fathers, and the opinions of the most eminent divines. They are at no loss for authorities; and the next generation will be much less so, inasmuch as it will have all the authority of the fathers as a primary foundation, and the authority of the present school of the saints in addition; and thus, if they continue to pursue this system of authorities, they will perpetuate the system of disobedience, by dint of pure learning and faithful quotation.

The teaching of the parsons is shamefully corrupt. The world has departed from the spirit of the moral law; and they have either led the world astray, or suffered themselves to be led by it. In either case, they are false teachers and unfaithful stewards; they are set up as moral instructors, and it is expected from them that they should inculcate at least the principles of the morality which they profess to acknowledge as a standard. These, however, they have invariably kept secret; they teach no better morals than are taught by every ordinary industrious and honest mechanic or tradesman, and they practise no better than is practised by the infidel and the blasphemous. The morality of the Bible is infinitely su-

perior to the morality of either churchman or dissenter; it is the morality of a perfect system of brotherhood, a system of mutual help and mutual instruction; of a system which says, "love one another, help one another, instruct one another." But the morality of the priest is merely the essence of the morality of this world of division, which separates the interests of families and individuals, and makes the stage of life an arena of never-ending strife.

As for the morality of Nature, it is anything or nothing. Nature is as bad and as good as you please to make her; hence her laws are both evil and good; and it is not the question with us what is the moral law of Nature, but what is the moral law of good Nature? The character of the moral law is in exact correspondence with the intellectual advancement of mankind. In a state of rudeness, ignorance, and barbarism, the law is equally rude, and enforced by barbarous punishments; it becomes less and less corporeal in its administration as the mind becomes enlightened; but there cannot be any definite period at which the one system shall cease and the other commence. There is no determinate line of distinction between good and evil; they are merely comparative; what is good to one age is bad to another; that which gives pleasure to the child is a nuisance to the adult. That which confers the greatest amount of happiness is best; but the morality of the wise is too refined for the foolish, and the pleasures of barbarians, the pastimes of the illiterate and unpolished throng, are equally averse from the nature of the philosopher. Whilst men differ in degrees of polish, there can be no general system of morality. Unity of opinion, equality of education, and the privileges of society, alone can bring the conflicting systems of morals to a focus, and constitute a universal morality as well as a universal faith.

THE SHEPHERD.

THE DOCTRINE OF THE "WOMAN."

NO. VI.

MANY have imagined, in reading our articles on this subject, that we were paying an exclusive deference to an individual, and setting her up as a leader for the world. The Southcottians at first conjectured that we must needs entertain the same narrow and unsocial views as themselves; and the infidels shrunk from the idea of receiving even an iota of instruction from one whom they are pleased, in their spirit of liberality and charity, to call a notorious impostress. Both parties misunderstood us; for our principles are different from the principles of both. We were treating of a mere sign or type of a great universal principle, called the bride or female spirit, and not of the substance, which is neither a woman nor a party, but the negative principle of the universal mind.

God has always been represented as a male, but Nature as a female. These two words, and this beautiful distinction, must ever be preserved. Nature is the bride, the true bride, and the party which represents Nature in the world, at present, is that party which worships Nature in a particular manner—namely, the materialists. Materialism or infidelity is the bride. Notwithstanding, in the progress of the church, this character is represented in running or successive types, in the church of faith, and

at last a distinct personal bride and church of the bride appear with a new revelation, in the manner of faith. This however is not the end ; it is still a delusion, and a gross delusion. And even the last move itself, materialism, the great representative of the female nature, and consequently the real bride, even she is a delusion and an imposture, until she be united with her husband—faith or spiritualism. All is delusion till the last and general union of all that has preceded, and all that still exists. The bridegroom is a deceiver without the bride, and the bride a deceiver without the bridegroom. Faith, or Christianity, is the bridegroom ; materialism, or infidelity, is the bride. But Christianity has deceived us, because it wants the liberality, universalism, and justice of infidelity ; and infidelity deceives and bewilders itself, because it wants the uniting principle of faith.

Having discovered that we were not exclusives, some of the Southcottians are now offended. This is what we wanted ; we want to shake off the illiberal minds. Others are determined to see more, and some are reconciled. 'Tis so with the other party ; the two extremes are always alike. The all-wise infidels of the invulnerable and impenetrable school have taken offence. Some won't read at all. Then, good-by Messrs. Liberals ; not one of you is gone without leaving a substitute in his place ; and we told you many months ago that we should count our sheep, and send away the goats, if we found any.

Jesus Christ had no bride, because he was not destined to bring in the kingdom of peace ; but he had a representative of a bride—the disciple whom Jesus loved, whose name was John, whom the painters have generally represented without a beard, and with long flowing hair, and who leaned upon Jesus' breast ! John is Johannes, and means the grace of God. It is the masculine of Joan or Johanna. This name is famous in Christianity ; it was the last representative of the school of Christ. The Wandering Jew is John the Divine, who was supposed to live until the second coming of Christ ; because John represents the spirit of Christ. There have been more popes of this name than of any other, and amongst the rest a Pope Joan, whose sex was not discovered till she brought forth a son by miscarriage in the streets of Rome. Joan of Arc was an inspired deliveress of France. Joanna of Venice is the celebrated bride-mother of Postellus, who cured diseases, and spoke so many different languages by a species of intuition, and from whom Postellus, the most learned man of his day, received the doctrine of the feminine principle of God, which he asserts must be taught before the old world terminates. Joanna Petersen, in Germany, Joan, of Kent, and Joan or Jean Lead, in England, and finally, our modern Joanna, are all running types of the spiritual principle of free grace, most emphatically represented by John and Joanna in faith, and by Anne, without the Joh (God) in materialism or infidelity, where it closes. But in the course of this long stream, we do not regard any one stage as final, nor any one individual as a leader. All is delusion until the ultimate union of all, which embraces the whole truth, and completes the progress of the world of division and sectarianism. Universalism is the only resting-place for the mind, and contains in itself the two principles in sub-

stance, the bridegroom and the bride, or God and Nature.

Our view of the doctrine of the Woman, therefore, so far as we have gone, is simply this : that Nature has always, in one way or another, been enforcing it ; sometimes by revelation, dreams, and visions, and sometimes by simple reason. It has been taught in the school of faith and in the school of infidelity, and at last both schools have brought it forth systematically—the one setting forth a woman as the mother of Messiah, and the other laying claim to the equality of woman, and her emancipation from the thralldom of man. Farther than this we do not insist upon, and as far as this every liberal and rational mind must go along with us. We shall never forget our principles of universalism, and shall take pretty good care not to set up any individual, either male or female, as a guide to truth, which is only to be discovered by investigating the great fundamental principles of the Science of Nature. Whenever we depart, or appear to depart, from this impartiality of doctrine, we hope our readers will immediately check us, and call us to account for our apostasy.

REVIEW.

Letter to Sir Robert Peel on Church Reform. By Richard Carlile.

It is chiefly extreme productions in faith or infidelity that we think proper to review in the *Shepherd*, because at present we are particularly addressing the extremes of both parties. Mr. Carlile is well known to the British public as the champion of infidelity and atheism, which he has defended with great zeal, and at a considerable sacrifice of personal liberty and property for many years past ; but it is not so well known to the public that he has within the last few years been so far reconciled to the Jewish and Christian scriptures as to regard them as a profound philosophical enigma, containing the essence of everlasting truth, concealed under a veil of allegory and mystery. But along with this respect (and we believe it to be perfectly sincere) for the scriptures of the Christian church, he still holds the atheistical doctrine of *universal death*. Chaos is the origin of all things. Life is only to be found in the individual organisation ; there alone is intelligence ; there alone is consciousness ; there alone is knowledge. The skull of man, finite and individual man, is the only source of system and intellectual arrangement.

Of course, he looks not to *universal*, but individual nature, for the original plan and direction of the progress human society. He searches amongst the Druids, the Egyptians, the Brahmins, and all the other demi-gods of the ancient world, for the original elements of Christianity, and then he supposes the scriptures to be manufactured in the form of a history by some individual, or college of individuals, and imposed upon the world as a literal fact, without any other proof than the paper and the ink which constituted the manuscript. Jesus Christ had no existence : he is merely the personification of a principle. Even the Jews are denied an existence, or the proof of an existence, before the time of Alexander the Great ; and the

whole world of letters has till now been deceived both by Greeks, Romans, Jews, and Christians, respecting the history of ancient Palestine.

What Mr. Carlile's object in making these assertions is we cannot divine; for it is clear enough that they are not capable of demonstration, and without even the shadow of an argument from history. A negative argument is of no use. If Roman historians have also omitted to mention Jesus Christ, English historians have omitted to mention Valentine Greatrex, and German historians Prince Hohenlohe and Mesmer; and it was a century and more before Christianity was of political importance to entitle it to be mentioned. If the Gnostics denied the reality of Jesus Christ's body, they never denied the reality of his appearance; they all agreed that a phantom appeared in the streets of Jerusalem, taught doctrine, and wrought miracles, and seemed to be crucified; but out of respect for their spiritual god, they said it was a vision. What has all this to do with the non-existence of Christ as a man?

Moreover, suppose he were to gain his point, what advantage would he derive from the victory? We see none. He acknowledges the truth and beauty of the scriptures as a *literary* allegory. Why should a *literal*, or matter-of-fact allegory, not be equally beautiful? If an imaginative scene be beautiful, just, and true, as delineated by the pen of a poet or the pencil of a painter, why should the same scene be considered as deformed in living nature? Why should the universal mind be denied the privilege of making living allegories on the stage of external nature, when man, his image and imitator, is making literary allegories on the stage of imagination? What is beautiful and just in the eye of the mind, is also beautiful and just in the eye of the body.

We cannot, therefore, see any propriety in rejecting the *literal* allegory and receiving the *literary* allegory, for the very same argument serves to defend and justify both. But the literary allegory is made by the individual mind, and the literal, or living allegory, by the universal mind; and Mr. Carlile puts a negative on the latter, because he advocates the doctrine of universal death, and the non-intelligence of Nature. "There is only one step," said Napoleon, musing on his Russian defeat; "there is only one step between the *sublime* and the *ridiculous*." There is also one step only between extreme infidelity and enlightened universal faith. Yet that one step entirely transforms the mind and its opinions; it makes a thorough revolution in its ideas and modes of reasoning. We are not without hope that Mr. Carlile will yet take this step into universal life, and abandon the gloomy and horrific doctrine of death and universal ignorance, which is out of all harmony and keeping with an age of *intelligence*. If Nature herself be infinitely stupid, stupidity is surely the perfection of humanity. Why should men follow Nature as their guide, if Nature be a brainless, thoughtless, blundering dunderhead? A philosophy which pretends to teach wisdom to man, should at all events hold up to view a model of intelligence. But atheism has no such model. Its universe is chaos, derangement of ideas, and total negation of purpose. Where is its model? Is it Nature? The Nature of the

atheist is worse than a fool; it is a dead block, a puff of wind, or a volume of gas. If we are to imitate this, the greater fool the greater philosopher. Is it God? atheism has no God. Is it man? there is no perfection in man. But the atheist says the laws of Nature are perfect. And yet Nature is not intelligent? Consequently, non-intelligence, or stupidity, is greater than wisdom, and ought to be cultivated by every good man, and admired above all things by every lover of Nature.

With the exception of this peculiar feature of Carlile's philosophy, (which may be, and no doubt is, palatable to him and many others,) and a few egotisms, which rather spoil the effect of what is reasonable and conclusive, the pamphlet recommends what very many, even of the Christians themselves, and indeed every reasonable man, would rejoice to see realized; it recommends a conversion of the Church establishment into a system of national education in the great principles of everlasting truth. That ultimatum will arrive; but it is not by the dictate of a minister, nor at the request of an individual or a party, but by the natural and gradual progression of the human mind in the pursuit of knowledge. Of this, moreover, we are thoroughly convinced, that it is not by any doctrine that puts a negative upon the literal or literary allegory of the Jewish and Christian scriptures that this important object will be attained; these two are the body and soul of the system, the matter and the mind, which must both be united to give life and vigour to "*Christianity Reformed*."

PLANTS.

THE motions of plants approaching nearest to those of animals are the following:—Many creeping plants detach shoots from their advanced stems, which spring up several feet distant from the parent plant; but this is a species of locomotion unconnected with volition. The *Helianthus*, or sun flowers, turn to the grand luminary in his progress from rising to setting, in consequence of the stimulus of heat and light. And they also open and shut their leaves, at stated hours, from a similar condition of the atmosphere. The *Mimosa sensitiva*, or sensitive plants, droop their leaves upon being touched, and they soon afterwards recover their former situation. The *Dionea muscipula*, or Venus's fly-trap, closes its prickly leaves when touched by a fly, and keeps them shut until the insect becomes quiet. But the most wonderful instance of irritability is observable in the *Hedysarum*, or moving plant of Bengal, which approaches and recedes its ternated leaves without ceasing, as well in the dark as in the light. All these motions are as distinctly the effects of mechanical impulse as the expulsion of the pollen by moisture, its transportation by the wind, and the bursting of the pod by heat.

But it is a much more difficult problem to explain the nature of the principles which determine plants to act in a way only that is most conducive to their own preservation, and so greatly resembling the instinctive impulses of the animal kingdom. Thus the propensity of the root to descend in the earth, and of the duck to dive in the water, the stem to ascend perpendicularly in the atmo-

sphere, and the eagle to soar in the air, are not less inviolable and uniform actions in one kingdom than the other. So little do some of the movements of plants depend upon external circumstances, that the husbandman is never solicitous how he sows the seed, as he is certain that, when it germinates, the root will infallibly strike downwards, and the stem will rise upwards. Nay, some plants are known to extend their roots to considerable distances in poor soils, while others overcome obstacles of the greatest magnitude, to arrive at a scanty supply of food, in a wonderful manner.

But the law of the ascending stem is not so uniform as that of the descending root, since many plants deviate from it, when their existence is at stake, and grow in a lateral direction, to arrive at the pure streams of air and light; nay, some stems will grow downwards to imbibe these celestial fluids. The ivy, for instance, and many other scandent plants, advance their stems several yards in one season, and escape out of doors and windows of buildings; nay, they will divide their branches, that they may take possession of both openings. The hop and honeysuckle will seize a pole any where near them, and ascend on it spirally, as if they knew from geometrical principles that it was the best method of rising on a weak body; and, when they are completely obstructed, will descend again in a straight line, to render their progress more speedy; thus demonstrating movements in consequence of a living principle, which we cannot explain.—*Dr. Jameson.*

CURIOUS INEQUALITIES IN THE AMERICAN PENAL LAWS.

TREASON, which, in mostly all the North American States is punished with death, is punished in Pennsylvania, for the first offence, with imprisonment for not less than three nor more than six years; and for the second offence, for not exceeding ten years.

Arson, in Maine, Massachusetts, Rhode Island, Connecticut, New Jersey, Delaware, Maryland, and Virginia, is punished with death; in New Hampshire, with solitary confinement, for not more than six months, and hard labour for life; in Vermont, if life is not lost in consequence, nor person nor limb injured, with hard labour not exceeding ten years, and fine not exceeding 1,000 dollars, or either of said punishments; and in Pennsylvania, with imprisonment in the penitentiary for the first offence, for not less than one nor more than ten years, and for the second offence, for not more than fifteen years;—by the code for Louisiana with imprisonment for life.

Rape, in Maine, Massachusetts, Rhode Island, Connecticut, New Jersey, Delaware, Maryland, and if by a slave in Virginia, is punished with death; in New Hampshire, is punished with solitary confinement for not less than six months, and afterwards with hard labour for life; in Vermont, with hard labour not exceeding ten years, and fine not exceeding 1,000 dollars, or either of said punishments; in Pennsylvania, for the first offence, with imprisonment not less than two nor more than twelve years; and in Virginia, if by a free person, with imprisonment in the penitentiary for not less than ten nor more than twenty years;—by the code of Louisiana, with hard labour for life.

Burglary, when the offender is armed with a dangerous weapon, in Maine and Massachusetts, and whe-

ther thus armed or not, in Rhode Island and Delaware, and for second offence, in New Jersey, is punished with death; in New Hampshire, it is punished with solitary confinement for not more than six months, and hard labour for life; in Vermont, with imprisonment in the state prison not exceeding fifteen years, and fine not exceeding 1,000 dollars, or either of said punishments; in Connecticut, imprisonment not exceeding three years, or if attended with personal abuse, or armed with a dangerous weapon, for life, or for a term of years not exceeding seven; in Pennsylvania, first offence, imprisonment not less than one nor more than ten years; for second offence, not exceeding fifteen years; in Maryland, with restoration of property, or paying the value, and imprisonment in the penitentiary not less than three, nor more than ten years; and in Virginia, with restoration or payment, and imprisonment in the penitentiary not less than five nor more than ten years;—by the code for Louisiana, with imprisonment for not less than ten nor more than fifteen years.

Sodomy, second offence in Rhode Island, second offence in New Jersey, by a slave in Virginia, is punished with death; in Maine, with solitary imprisonment not exceeding one year, and imprisonment at hard labour not exceeding ten years; in Connecticut, imprisonment for life; in Massachusetts, solitary confinement not more than one year, and hard labour after not exceeding ten years; in New Jersey, fine and solitary imprisonment with hard labour not exceeding twenty-one years; in Delaware, solitary imprisonment not exceeding three years, and whipping publicly with sixty lashes on the bare back; in Pennsylvania, first offence, for not less than one nor more than five years, second offence, not more than ten years; in Maryland, imprisonment in the penitentiary for not less than one nor more than ten years; in Virginia, imprisonment in the penitentiary for not less than one nor more than ten years.

Robbery, in Maine and Massachusetts, when the offender is armed with a dangerous weapon, and intends to kill, is punished with death; in Rhode Island, with death; in New Hampshire, it is punished with solitary confinement for not more than six months, and afterwards with hard labour for life; in Vermont, imprisonment not exceeding fifteen years, and fine not exceeding 1,000 dollars, or either of said punishments, second conviction, imprisonment for life, or not less than seven years; in Connecticut, imprisonment not exceeding seven years; in New Jersey, fine and solitary imprisonment with hard labour not exceeding fifteen years; in Delaware, on or near the highway, or in a dwelling-house, fine not less than 1,000 dollars nor more than 5,000 dollars, the pillory for one hour, sixty lashes on the bare back well laid on, imprisoned not exceeding four years, and afterwards sold as a servant for fifteen years—if committed in any other place than as before, fine not less than 500 dollars nor more than 2,000 dollars, thirty-nine lashes as before, imprisonment not more than two years, and afterwards sold as a servant for ten years; in Pennsylvania, first offence, not less than one nor more than seven years, second offence, not more than twelve years; in Maryland, restoration or payment of the value, and imprisonment in the penitentiary not less than three nor more than ten years; in Virginia, restoration or payment, and imprisonment in the penitentiary not less than five nor more than ten years;—by the code for Louisiana, with imprisonment at hard labour for not less than seven nor more than fifteen years.

Mayhem, in Connecticut, when the tongue is cut out, or the eye is put out with malice, is punished with death; in Maine, with solitary imprisonment not exceeding one

year, and imprisonment with hard labour, or in the county gaol not exceeding ten years; in New Hampshire, solitary confinement not less than six months, and hard labour not less than one year nor more than twenty years; in Vermont, imprisonment for life, or a term of years not less than seven; in Rhode Island, with a fine not less than 50 dollars nor more than 2,000 dollars, and imprisonment for not more than two years; in Massachusetts, solitary confinement not exceeding one year, and hard labour or imprisonment in the county gaol for any time not exceeding ten years; in New Jersey, fine not exceeding 1,000 dollars, or imprisonment at hard labour not exceeding seven years, or both; in Delaware, fine not exceeding 2,000 dollars nor less than 400 dollars, whipped on the bare back with sixty lashes, imprisoned for not exceeding two years, and afterwards sold as a servant for not less than four years nor more than seven years; in Maryland, penitentiary imprisonment for not more than ten years; in Virginia, penitentiary for not more than ten nor less than two years, and fine not exceeding 1,000 dollars.

Duelling, killing a person in a duel, in Vermont and Virginia, is punished with death; in Maine, fighting a duel, giving a challenge, or acting as a second, is punished as a felonious assaulter, and disqualified for twenty years from holding any office under the state government; in New Hampshire, accepting a challenge, imprisonment in the common gaol not exceeding one year, and disqualified from holding any office for five years; in Connecticut, sending or accepting a challenge to fight a duel, a fine of three thousand dollars, and bonds to keep the peace and good behaviour during life, and disabled from holding any office—delivering a challenge, the same punishment, except not finding securities for good behaviour; in Rhode Island, though death does not ensue, to be carried publicly in a cart with a rope round the neck to the gallows, and sit thereon for one hour, and be imprisoned not exceeding one year, either or both; in Massachusetts, when death shall not ensue, and challenging to a duel, though no duel be fought, and a second, aider, or abettor, punished as a felonious assaulter, solitary confinement not more than one year, and hard labour not exceeding twenty years, and disqualified from holding office for twenty years—accepting a challenge, though no duel ensue, and thus aiding and abetting, imprisonment in common gaol not more than one year, and disqualified from holding any office for five years; in New Jersey, challenging to fight a duel, though no duel be fought, or knowingly being the bearer of a challenge, or in any way aiding or abetting, fine not exceeding five hundred dollars, or imprisonment with hard labour not more than two years, or both—fighting a duel when death does not ensue, or being a second, or aiding or abetting in such duel, fine not exceeding 1000 dollars, and imprisonment at hard labour not exceeding four years, or both; in Delaware, giving or accepting a challenge, carrying or delivering such challenge, engaging in and fighting a duel, or being a second, whether the duel take place or not, or any way concerned in aiding or encouraging, fine 1000 dollars, imprisonment three months, and for ever disqualified from holding any office in the state; in Maryland, fighting a duel, and killing an antagonist, or wounding him, so that he shall die thereof within twelve months and a day, and aiding and abetting, confinement in the penitentiary for not less than five nor more than eighteen years—challenging or accepting a challenge to a duel, declared incapable of holding any office, civil or military, in the state; in Virginia, challenging to a duel or accepting a challenge, for ever disqualified for office; by the

code for Louisiana, if in a duel the criminal kill his antagonist, he shall be imprisoned not less than two nor more than four years, and forfeit for ever his political rights, and his civil rights of the first and third class, and if such death or mortal wound be by treachery, he shall be deemed guilty of assassination, and suffer the punishment for that crime.—*Report on Prison Discipline.*

THE LIBERTY OF THE PRESS.

NOTWITHSTANDING the imperfections of our Government, there is no country in the world where the liberty of the press is more uninterruptedly enjoyed than in England. True, we have a heavy tax upon newspapers, which we hope to see very speedily repealed; but in every other respect England is decidedly in advance of every country in the world. Even in the mere typography and external aspect of our literary productions, we are an age beyond all others. What a contemptible looking thing is a French, or an American, or a German paper, compared to an English one. The clearness and smallness of the type, the quantity of matter, the quality of the paper, give an immeasurable superiority to the English press. And how few prosecutions, after all, take place by order of Government! In France they are a hundred to one compared to the prosecutions in England, whilst our English editors express themselves with as much spirit and deadly hostility to the powers that be as the public mind is willing to countenance. In fact, the moral influence of the public is much more restrictive than the jealousy of the Government. Not so in Germany, the cradle of Protestant Reformation, where so little liberty is enjoyed, that a member of the Diet was obliged to fly from the relentless indignation of the supreme power, for merely giving publicity to the debates; and Professor Funk, of Frankfort, has been cast into prison, for publishing a short history of his country, in which he represents it as lying in a state of slavish degradation, fettered by the chains of a domestic foe, and impatient to throw off the badge of servitude and imbecility. The book has met with a remarkable circulation, and this is quite enough to rouse the suspicions of the petty lords of Germany.

ON MENTAL DISEASES.

LETTER I.

"Animum rege, qui, nisi pareat
Imperat." *Horace*, 1 Epist. ii., v. 62.
Curb thy mind, which must be ruled, or rule.

A FEW months ago I announced a lecture on mental diseases; the apathy of the public, however, to scientific lectures, was so great, or rather the antipathy to the lecturer so strong, that no living soul deemed it worth the while to honour him with their presence. And yet what subject more important both for the philosopher and for the physician, indeed for the every human being, than to know what a mental disease is, how it originates, and by what means this most terrible affliction can possibly be cured?

On seeing the total want of desire of acquiring knowledge upon this topic, one might be tempted to believe that this disease had been extirpated from this country, or that the means of curing it were so well known as to make it superfluous to devote a single moment of attention to such an important subject.

But every day's experience proves quite the reverse of this supposition. No country in the world presents so many instances of mental derangements as England; in

no country in the world are individuals more exposed to be deprived of their liberty, and of the power of disposing of their property, under the plea of insanity, than in England: and in no other country are those who are unhappily insane exposed to the irrational treatment of those quacks who keep private mad-houses.

In no department of the medical science has the canker of materialism and mechanical experimentalism done more mischief than in the treatment of insanity. This being the fact, it becomes a duty of my conscience to impart to my readers all the knowledge which I have acquired upon this matter.

This paper, through the medium of which I have spread the seeds of a new science (tellurism); this paper, which, by advocating the only true doctrine of nature (universalism), opens the gates to all important enquiries; this paper will be the organ through which I shall endeavour to broach this important topic.

If men lived according to the laws of nature; if our desires could always be rationally satisfied; if our social arrangements did not create unnatural wants, poisonous passions, diseased feelings, and tyrannical fashions; if our laws were given or administered with the aim of promoting the happiness and morality of the many, our public life would not present the horrible spectacle of so many crimes, and our private life would not be saddened with the occurrence of so many diseases, among which the mental disorders are the most afflicting.

I can say with truth, and this truth I have found out by a long series of observations, mental derangements are the offspring of that state of immorality, despotism, over-refinement, and misery, called civilization. Among the tribes who live in the wild state of nature, insanity is unknown to exist; among the eastern nations, who live in a state nearer to nature insanity is so scarce, as to make the insane be regarded as the favourites of divinity. Among the inhabitants of the Alps, and of the northern countries, insanity is seldom to be met with. London, Paris, and other great metropolises of the continent, present the greatest number of mental derangements. These metropolises, however, are the focus of civilization. Indeed, for those who do not acknowledge a providential place in the development of the human species; for those who do not know that the present civilization is like unto a corrupted mass, from which a new organic life must come, this only effect of civilization is enough to justify, in the eyes of the true philosopher, the follies of the modern Utopists, who dream to save mankind by making it retrograde to the original state of animalism.

We find, then, mental derangements coeval, and connected, as it were, with civilization. The first general cause of this disease are the bad passions, feelings, and regulations, originating from our social arrangements.

I have visited the principal mad-houses of England, France, Germany, Italy, and Holland. I have perused the statistics of the different public and private establishments. There are three principal causes assigned therein for mental disorders:—love, pride, and religious fanaticism. Love in women, pride in men, and religious fanaticism in both. Are these causes not all to be retraced in the corresponding badness of our laws and fashions? Are not the affections of the fair sex exposed to the seduction of the libertine, or repressed by the despotism and avarice of the parents, or by the still more oppressive tyranny of fashion? Are not all our arrangements artificial engines, by which pride and rivalry are put continually into violent motion? Where is to be found that sound religious instruction, which instead of making our belief a spring to social virtues, does not torture the heated

fancy with the life-consuming terrors of eternal damnation?

These, these are chiefly the causes that have bereft, and are daily depriving, many individuals of both sexes of the greatest privilege of humanity, viz., the harmony of the intellectual, moral, and physical faculties.

Can these causes be counteracted with bleeding, vomiting, physicking, solitary confinement, strait-jackets, and similar remedies?

Are the doctors who resort to those means, if they adopt them conscientiously, not as insane, if perhaps not more insane, than their patients?

I am not ignorant that there are cases in which insanity depends on malformation of the brain, or on some other organic defect; I know that often the disease, which originally was accidental, becomes constitutional. But all these are exceptions. In most cases the harmony of the intellectual, moral, and physical faculties of men is destroyed by moral influences; and in my future letters I will show that the nature of most of the mental diseases is purely mental, and can only be cured by psychical, that is, spiritual and moral, remedies. In cases in which the nerves, however, are affected, no internal drugs, but tellurism, ought to be employed.

I will show, also, what internal remedies are the most useful in the exceptional cases.

These matters deserve a minute investigation, and will give the opportunity of a new series of letters to

THE ALPINE PHILOSOPHER.

OPINIONS OF EMINENT CHURCHMEN ON CHURCH REFORM.

It pleased God in his unsearchable wisdom to suffer the progress of this great work, the reformation, to be stopped in the *midway*, and the effects of it to be greatly weakened by many unhappy divisions among the reformed." (Dr. Lowth, afterwards Bishop of London: Visitation Sermon, 1758.)

"The innovations introduced into our religious establishment at the reformation, were great and glorious for those times; but *some further innovations are yet wanting* (would to God they may be quietly made!) to bring it to perfection." (Dr. Watson, Bishop of Llandaff, Misc. Tracts, vol. II., p. 17, &c.)

"I have always had a true zeal for the Church of England,—yet I must say—*there have been many things in it that have been very uneasy to me.*" (Bishop Burnet: Hist. Own Times, vol. II. p. 634.)

"Cranmer, Bucer, Jewel, and others, never considered the reformation which took place in their own times as complete." (Simpson's Plea.)

Long after Cranmer's days, some of the brightest ornaments of the church still thought a reformation was needed. Tillotson, Patrick, Tennison, Kidder, Stillingfleet, and others (Simpson's Plea) endeavoured a further reformation, though in vain.

"We have been contented to suffer our religious constitution, our doctrines and ceremonies, and forms of public worship, to remain nearly in the same *unpurged, adulterated, and superstitious state* in which the original reformers left them." (Simpson's Plea.)

I attribute this want of reformation primarily to the political alliance of the church. Why should those who have the power refuse to effect it, unless they feared some ill result? And what ill result could arise from religious reformation, if it were not the endangering of temporal advantages?

"I would only ask," said Lord Bacon, two hundred

years ago, "why the civil state should be purged and restored by good and wholesome laws, made every third and fourth year in parliament assembled, devising remedies as fast as time breedeth mischief; and *contrariwise*, the ecclesiastical state should still continue upon the dregs of time, and receive no alteration now for these five-and-forty years and more?—If St. John were to indite an epistle to the church of England, as he did to them of Asia, it would sure have the clause, *habeo adversus te pauca*." (Works: edit. 1803, vol. ii. p. 527.) What would Lord Bacon have said if he had lived to our day, when two hundred years more have passed, and the establishment still continues "upon the dregs of time?" But Lord Bacon's question should be answered; and though no reason can be given for refusing to reform, a cause can be assigned.

Bishop Porteous informs us that himself, with some other clergymen (amongst whom were Dr. Percy and Dr. Yorke, both subsequently bishops), attempted to induce the bishops to alter some things, "which all reasonable persons agreed stood in need of amendment." The answer given by Archbishop Cornwallis was exactly to the purpose—"I have consulted severally, my brethren the bishops; and it is the opinion of the bench in general that nothing can in prudence be done in the matter." (Works of Bishop Porteous, vol. i.) Here is no attempt to deny the existence of the evils,—no attempt to show that they ought not to be amended, but only that it would not be "prudent" to amend them. What were these considerations of prudence? Did they respect religion? Is it imprudent to purify religious offices? Or did they respect the temporal privileges of the church?—No man surely can doubt, that if the church had been a religious institution only, its heads would have thought it both prudent and right to amend it.—*Parliamentary Review*.

BREAD FROM WOOD.—Dr. Prout has clearly proved that all the chief alimentary matters employed by man may be reduced to three classes, viz., saccharine, oily, and albuminous substances, the most perfect specimens of which are respectively sugar, butter, and white of egg. The saccharine principle, in its extended sense, includes all those substances which are chiefly derived from the vegetable kingdom; means, in fact, the same thing as what we commonly call vegetable diet. It comprehends all those substances, whatever their sensible properties may be, into the composition of which hydrogen and oxygen enter in the proportion in which they form water; for example, the fibre of wood, which chemists call *lignin*. Much skilful manipulation and delicacy of experiment were required to establish this result; but the nutritive property of the woody fibre—in short, that a tolerably good quartern loaf can be made out of a deal board—has been proved by the recent labours of a German professor, and may be verified by any one who will take the trouble to repeat them. The following, says Doctor Prout, was the method he employed for this purpose:—In the first place, every thing that was soluble in water was removed by maceration and boiling; the wood was then reduced to a minute state of division, not merely into fibres, but actual powder; and after being repeatedly subjected to the heat of an oven, was ground in the usual manner of corn. Wood thus prepared, according to the author, acquires the smell and taste of corn flour. It is, however, never quite white, but always of a yellowish colour. It also agrees with corn flour in this respect, that it does not ferment without the addition of leaven, and in this case sour leaven of corn flour is found to answer best. With this it makes a perfectly uniform and spongy bread;

and when it is thoroughly baked, and has much crust, it has a much better taste than what, in times of scarcity, is prepared from bran and husks of corn. Wood flour also, boiled in water, forms a thick, tough, trembling jelly, like that of wheat starch, and which is very nutritious. The nutritious properties were first tried on a young dog; afterwards he fed two pigs upon it; and then taking courage from the success of the experiment, the professor attacked it himself. His family party, he says ate it in the form of gruels or soup, dumplings, and pancakes, all made with as little of any other ingredient as possible; and they found them palatable and quite wholesome.—*Mechanics' Magazine*.

JACOB BEHMEN.—This is one of the most extraordinary mystics who ever lived. His writings are very voluminous, and generally illustrated with plates, which give a better idea of his system of philosophy than the language which illustrates them. Unless a man have a natural genius for mystics, it is impossible for him to read one page of Jacob's works without exhaustion, they are so unfathomably profound, and in many respects perfectly incomprehensible. They exhibit, however, proofs of a very powerful mind, and the plates in succession form a very beautiful system of progress and universalism, partaking of the imperfections and exclusiveness of the pietists, and the age in which he lived. The foundation of his system is as follows:—"That the divine grace operates by the same rules, and follows the same methods, that Providence observes in the external world; that the minds of men are trained and purified in the same way that metals are purified from their dross." Dr. Mosheim calls this a chimerical notion; yet nothing is more agreeable to reason and scripture. What is the experience of evil but a furnace? and the scriptures say that man must go through the furnace of affliction, and come out like gold seven times purified. Jacob is a better philosopher than his critics. Amid all the reveries of the innumerable sects of pietists in Germany there was this universal feature, the prediction of the glorious establishment of Christ's kingdom on earth, and the overthrow of all reigning systems—they were merely the natural types or forerunners (in ignorance and imperfection) of the great social revolution which is to be effected by the union of science and revelation.

CORRESPONDENTS.

Mr. Rutlish may state his views of *Astrology* to the Shepherd, provided he do so in a brief, a liberal, and delicate manner. He must remember the prejudices of the world are strong against the science; and though we defy all the prejudices of the old schools, we use and recommend great caution in doing so. We have no doubt but the Society at No. 36, Castle-street, would be happy to hear a lecture on *Astrology* from Mr. Rutlish, if he has no objection to give one, and stand the test of some opposition. He will find friends to defend him against all his enemies.

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 6th inst., at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 33.]

SATURDAY, APRIL 11.

[Price 1d.]

SYSTEM OF NATURE.

WE affirmed last week that the morality of Nature was either good or bad, as you pleased to make it. Its character is inversely proportioned to the degree of cultivation. This, however, is only true in respect to its specific and individual character. There are general rules of morality, which hold good in all ages, and are eternal as the laws of Nature herself.

The fundamental law of all morality is individual happiness. This is the first object of animal pursuit, and may be called the first moral law. In a state of ignorance this object of individual happiness is eagerly pursued at the expense of the happiness of others. *Me* and *mine* are unsocial and abstract terms, which do not involve the consideration of the happiness of the species, because no system of social arrangement has been projected or instituted to create any necessary connexion between the happiness of the individual and the happiness of the whole.

The want of such a system of social interest corrupts the principle of individual selfishness, and compels it to resort to broils and contentions, the greatest enemies of public and private happiness.

Individualism, or the love of self, is the first movement of Nature; and the extreme limit of its progress onward is universalism, or the love of all. This, however, though nominally different, is virtually the same as the other. Individual happiness can never be enjoyed at the expense of the happiness of others. Human nature revolts more or less at the idea of inequality in the enjoyments of life. Even the tyrant and the wealthy aristocrat cannot refrain at times, when they think of the sufferings of the poor, from expressing their sympathy with the forlorn condition of poverty, and wishing that Nature had ordained it otherwise; although their self love will not permit them to sacrifice an iota of wealth or privilege to better the condition of the poor. Individual man is never so divinely happy as when he sees universal man, or society, all rejoicing around him.

Self love and social love therefore are one and the same thing, when under the influence of an enlightened mind; but not so when ignorance is in the ascendant; and as ignorance is the first state of humanity, it follows that self love must first be productive of evil, before it be productive of good.

The morality of Nature, therefore, is either good or bad, according as it is directed by wisdom or folly. The original motive, the love of happiness, is always good; but that motive must be misdirected before it can dis-

cover the true path to universal happiness. Man *must* fall, and rise again.

As the love of individual happiness is the fundamental and only law of individual morality, so the love of universal happiness is the only law of public morality. There is no occasion for any other fundamental principle of morals than this:—Individual and universal happiness are the end and purpose of all human actions. How are these to be attained? In this question is comprehended the whole of morality.

Judge Blackstone says, that if man were to live in a state of nature, unconnected with other individuals, he would need no other law but the law of Nature and of God; but in a state of society another law, namely the law of nations, or artificial law, comes into operation. The judge has evidently divested himself of his usual shrewdness in making such a distinction as this, which has the unfortunate effect of leading men to suppose that there is a necessity for other precepts and restrictions than those which Nature herself directly points out as indispensable for our happiness.

The distinction between natural and artificial morality is a false distinction, and in order to remove the erroneous impressions which it creates, we shall shortly subject it to critical examination. The law of Nature, according to Judge Blackstone himself, is contained within this one rule of obedience, "That man should pursue his own happiness." One would suppose from this definition that every law in existence ought to be contained within this single universal rule, since the attainment and promotion of happiness is the professed object of all. But it has been a general, though ignorant, belief of all past ages, that society is not natural to man, and that the passions, appetites, and impulses of individuals have no necessary connexion with, or control over, one another; that Nature only provides an impulsive movement for the individual, and leaves it to reason or art to form whatsoever other arrangements are necessary for the general good. There is some apparent truth in this; but the movements of society are not more under the control of reason or art than the movements of individuals. Wherever reason resides, there it governs and directs; but the individual has no occasion to write down laws for himself, inasmuch as he is his own lawgiver, and can enact and repeal at pleasure. The body of society is also its own lawgiver, but, consisting of many individuals, it must commit its laws to paper in order to form a link of communication and general understanding between all the members. But there is not more or less of Nature in the one mode of government than in the other. The

reason and the conscience of a savage is quite as artificial as the Code of Justinian. It is only less complicated, by embracing a more limited scope of thought and action.

The law of Nature, therefore, applies to both the individual man and the collective man, and the same test of excellence will serve for both. Let us, then, imagine to ourselves a single individual, such as Robinson Crusoe or Alexander Selkirk, on a desolate island, living in a state which our learned civilians and divines have unanimously designated a state of nature; by what process of reasoning do we come to the discovery of what is or is not the law of good morals for the regulation of that individual's conduct? In the first place, the preservation of his health is necessary; he must avoid all excesses which tend to weaken his body or derange his mind. If he has a strong propensity for any indulgence which is injurious to his constitution, it is his duty to repress that propensity, and if possible destroy it; if the palate rejoices in that which is injurious to the stomach, the palate must sacrifice its own pleasure for the satisfaction of its helpmate; if the bowels rebel against the predilections of both, then both must give way to the humour of the bowels: in fine, if one limb, one smallest member of the body, should suffer from any particular indulgence which is granted to the cravings of another, the man's morals are imperfect, his prudence is defective, the balance of his different appetites is not in a state of adjustment. In other words, his morals are bad, and his system will ultimately suffer in consequence of this partiality of conduct, this unjust preference which he gives to particular desires.

The body collective is merely the prototype of the individual. As the individual has a head to govern his body, so must society have a head to direct its movements. As the individual has other inferior members of different degrees of influence and honour, so also must the body collective have its various grades of employment for its component members, each individual being respectively placed in the capacity for which Nature has originally predisposed him, by talents or inclination; so that the ultimate result may be that all shall be as content with the various offices which they fulfil, as the different species and sexes of animals are with the species and sex to which they belong, nor have good cause to murmur at the usurpation of any particular class, which satiates itself, and paralyses the vital energies of the other departments of society by its own unrestrained selfishness and inconsiderate indulgence. This is an abstract general outline of the morality of Nature; the standard is in ourselves, in the individual man, in the body, in the passions, which all manifest the eternal and unchangeable law of gradation of rank, but so beautifully harmonised that every member rejoices in the happiness of its fellows. When human society shall have attained this harmony, the universal man may be said to be created; till then we are merely a chaos of conscious atoms, clashing against each other, to the infinite annoyance and misery of all.

To accomplish this, it is not necessary that one individual, or class of individuals, should take possession of large territories or tracts of land, and employ them for the

exclusive advantage of themselves and those of their own body begotten. We have already seen that this is a vice in the individual, and of course it must also be a vice in the collective, or social body. But if it be contrary to prudence and the harmony of nature thus to confer exclusive property upon individuals and families, it is not out of harmony with the law of good public morals to confer superior power and control upon superior individuals. Our own nature teaches us the necessity of this law. The eye is our guide for motion, the ear for sound, and the other senses have their corresponding sphere of action, in which the whole body obeys them, and obeys them willingly, and only that care is bestowed upon each which is necessary to keep it in healthy action. But of all the senses, the sense of feeling is the only universal sense, and this represents the people. We consult the interest of this sense above that of any other, and always consider ourselves extremely foolish if, in a state of absorption, indulging the pleasures of sound, or of vision, of taste or of smell, we encounter any bodily injury which irritates the most vital of all the senses.

And what have the Governments of the old world been doing, but giving way to the appetites and inclinations of small fractions of the body politic, and thus exposing the great bulk of society to the dangers of misgovernment? Why do the poor cry out against the rich, but because they are plundered of their due? Why do the weak cry out against the strong, but because they have found oppression instead of defence? Why does society complain at all, but because it is *immoral*? It is destroying its own constitution by imprudence, by pampering one portion of its nature, and neglecting to dress the wounds which afflict its extremities, which are now so sorely cankered as to threaten destruction to the universal system of ignorance and misgovernment.

THE SHEPHERD.

P. S. We forgot in our last to say that the morality of the Bible, as well as the morality of Nature, is good or bad, as we are disposed to make it. The omission might cause erroneous impressions on some, but we have illustrated this view of the Scripture morality on a former occasion. The base, or vital principle of the moral law, is eternal; but is capable of many transmutations and refinements as society progresses. Thus it is possible that the commandment, "Thou shalt not steal," may one day become a dead letter, when all private property shall be thrown into a common stock; still the principle is *valid*, though the breach should become impossible. Ceremonial laws entirely disappear, and are as fickle and local as human fancy or the head-dresses of the ladies; but the moral law of the ten commandments contains the principle of immortality in an eminent degree; it holds a place amongst all other laws and customs, like man amongst the brutes. Notwithstanding, Jesus Christ's summary of the decalogue is better than the decalogue itself: "Thou shalt love thy neighbour as thyself." This is "universalism," the divided law reduced to a single proposition. The change or refinement of the letter of the moral law is a very delicate subject; it is the only subject upon which we have any fear of entering.

ON MENTAL DISEASES.

LETTER II.

*Durum, sed levius fit patientia
Quicquid corrigere est nefas.*

Horace, 1 Ode, xxiv. 19.

It is hard, indeed; yet patience makes us bear whatsoever is impossible to mend.

I HAVE often laboured very hard to find out a definition which might convey a clear idea of insanity; but after having lost many days and many nights in this undertaking, I found at last that my labour was lost. Insanity is the opposite to soundness. In order to know what unsoundness may be, we must know what soundness is. But who can point out clearly enough what soundness is, and soundness of the mind in particular? Mind—these four letters, how many different ideas do they not comprehend! Indeed, this word alone has put many philosophers out of their mind; and yet, without knowing what mind is, it is preposterous to dare to talk of the diseases of the mind.

The word mind signifies the unity of the perceptive, imaginative, judging, and creative faculties; like unto the word life, it comprehends all forms of being and acting. In the same way that a bodily disease affects one or the other form or mode of vitality, or one or the other system on which the animal, sensitive, or vegetative process of life depends, or a single organ, or a part of the organ, in the same way the spiritual disease affects some particular form of the modes of intellectual life.

The perceptive faculties may be sound, and the imaginative be diseased; or, *vice versa*, the judging faculty may be impaired, and the creative faculty—will and reason—may be healthy. The whole mind is seldom or never diseased. In order to judge with discrimination of the mental diseases, we must first analyse the different forms of spiritual life.

If we pay a little attention to our perceptive faculties, we find that they are, generally speaking, equally good in all human beings. The difference between a thousand individuals is, mathematically speaking, = 0. Yet there are a few exceptions, and the question is, whether the greater or less degree of quickness in perception be a mental disease.

The common sense, which in all matters assumes the authority of a supreme judge, is ready to apply the epithet of stupid fools to those who want quickness of perception. I beg leave to impugn this judgment. Quickness of perception is often more the step-ladder to folly than slowness of perception. Those beings, whose nerves are so sensitive to smell a cat in a room, or to shriek at the noise of a creeping insect, or to shut their eyes at the flash of lightning, deserve more the name of fools, than those who seem untouched by all that surrounds them.

I have known many sensitive mothers who would have lectured their children for whole hours, when they, moved by the same instinct that impels the naturalist to analyse an object of nature, had torn to pieces a picture or a watch, or even an insect. I say I have seen such mothers torture to death their servants, drive into madness their grown daughters, yet read with rapturous joy

the accounts of a murderous battle, in which the husband or the son had soiled their hands with human blood!

People with too fine perceptive faculties are, according to my experience, more liable to diseases of the mind than others in which these faculties are more obtuse.

To cure these diseases there is no other drug but the reasoning power of the philosopher, or the causticity of the satirist. Yet the last remedy is often dangerous; when the former, on the contrary, is always harmless, and often more efficacious. But how few have the moral courage to counteract by sound reasoning the follies of over-refinement and fashionable sensibility!

Next to the perceptive faculties comes the imagination, which, in most cases, is liable to fatal diseases.

I do not, however, agree with those who ascribe to this faculty all the woes of mankind; on the contrary, I regard the imagination as one of the noblest faculties of the human mind. Indeed, if I should live to be deprived of this heavenly power to create a world of my own wherever I am forced to live, to spread a charm over all my desires, to impart an energy to all my actions; if I should be condemned to live in the society of beings deprived by some caco-demon of this magical power, methinks I should become instantly a misanthrope and a myogin, and bury myself alive in the forests among apes and tigers.

Yet this power, if not properly cultivated and pruned, is like unto the power of the wine: it deprives the man of his senses.

A friend of mine had gone to take a sea-bath, with his brother. The first was an excellent swimmer, the other a very indifferent one. My friend, in the prime of his age, swam far into the sea; his brother remained behind. Whilst the swimmer was playing with the waves, his brother was seized with the cramp, and perished; my friend, returning from his sport, sought his brother, but in vain. He called him, but received no answer. He swam in all directions, but no track of his brother was to be found. This event plunged my friend in deep melancholy, and his imagination represented constantly to his eyes the sea-shore, and his brother struggling with the waves, and perishing in the main. He travelled from country to country; the same picture was always present before his eyes. In all other respects he was of a sound mind. Yet, often amidst the most serious conversation on scientific subjects, he broke out into loud lamentation, threw himself over chairs and tables, and swam with all his power. His head was dropping with perspiration; and after a while he fell into a state of exhaustion and stupor. All means adopted to restore his energies were useless. "His unbridled imagination at length destroyed his bodily health; he died of exhaustion after having once swam for about an hour on the floor.

The diseases of imagination can be cured by acting upon the imagination. In such cases the power of music is great; yet greater is that of some terrible event, true or fictitious, which may give to the imagination a new scope. An acquaintance of mine, who had a private mad-house, has cured several diseases of a similar nature, either by communicating to his patients some dreadful news, or by using the phantasmagoria, or similar contrivances to create fear, or to awaken hope.

A diseased imagination turns pride into madness. Pride in itself is nothing but self-esteem; but when a man esteems himself for possessing that which he does not possess, or for deeming himself worthy of esteem for that which deserves blame or contempt; in the first case pride turns into folly; in the second, into madness. Unbridled self-esteem is always accompanied with silliness, or insolence; it generates the coxcomb and the villain. The emperor Nero was a mixture of both.

This disease is most difficult to be cured. How will you persuade a man who thinks himself to be a witty fellow that he is but a ninny? How can you convince one who is proud for having offended the laws of God and nature? How can you convince a Duke of Alva, a Napoleon, or similar madmen, that the actions for which they glory themselves are infamous and contemptible?

Perhaps you can cure of this folly a poor devil with whom you can speak plainly, and without fear that your words be countermined by flatterers. Among the higher classes this kind of disease is utterly incurable. But I perceive that, whilst tracing this picture of human folly, my own mind begins to totter; wherefore I must leave the *Shepherd* and his flock, and retire to rest. Rest and patience are two of the best preventions against madness.

THE ALPINE PHILOSOPHER.

REPRODUCTION.

Microscopic animals are produced by such an obscure process, that the doctrine of equivocal generation, exploded by the discovery of the microscope, which demonstrated eggs and seeds in certain substances undergoing the process of fermentation, has in some measure been renewed, by the further observation of animalcules, living in watery infusions of animal and vegetable matters, after their ebullition and exclusion from the atmosphere; and there is reason to believe that as the microscope undergoes further improvements, others will be found in decreasing series, which must preclude every kind of explanation of the subject from actual observation. Dr. Darwin's account, of what he terms solitary generation, is not a satisfactory one. He says "Organic particles of dead vegetables and animals, during their chemical changes into putridity or acidity, do not lose all their organisation or vitality, but retain so much of it as to unite with the parts of living animals in the process of nutrition, and produce new complicated animals by secretion, as in generation, or produce very simple microscopic animals and vegetables, by their new combinations in warmth and moisture."—Temple of Nature, note to canto I.

We are however convinced that every living creature has been unequivocally derived from parents of the same species with itself, and that ova of infusoria animalcules, and seeds of vegetable mucor, float in the atmosphere in states of imperceptible minuteness and indestructibility.

Oviparous animals, strictly so denominated, deposit their embryos, with a portion of prepared nutriment, in some foreign situation, where it can receive warmth for development, and food for future support, which enables the parents to multiply their brood to an immense amount.

Most small animals generate in this way, and their fertility being nearly in the ratio of their size, they constitute by far the most numerous orders of the animal kingdom. Thus the ova of gnats, butterflies, and birds, are propagated profusely several times a-year. Their eggs are laid, and completely hatched in three or four weeks at farthest, and the young are immediately capable of providing for themselves.

The egg of the domestic fowl derives its yolk from the ovary, and its nutritious white and shell from the oviduct, which conveys it to the external world. The changes commence from external heat in the cicutricula, by a white spot appearing at the obtuse end of the egg. In three days the spine, eyes, and pulsating heart of the young animal become conspicuous. In two days more, lungs incapable of function are discovered. On the fourteenth day feathers appear; on the nineteenth the chick makes noises; and it breaks through its shell on the twenty-first day. The chick derives nutriment during incubation, from the white, and at last from the yolk of the egg, which waste gradually as it increases in size, not unlike the germination of a plant, from the mucilaginous cotyledons of the seed.

Viviparous animals, consisting of man and quadrupeds, do not confide their scanty and valuable progeny to a precarious supply of heat and nutriment, but they retain the embryo within their own bodies, which they nourish until it acquires a certain size, and the mother's organs are sufficiently developed to supply it with food, in the helpless state of its infancy. Hence their long periods of gestation and suckling allow time for a greater increase of size, and perfection of organization, but at the same time limit the number of the species. Quadrupeds, of course, seldom produce more than three or four young in a year, and the human species not more than one upon an average of two years. In short, every species of female animal, except zoophytes, possesses one or two ovaries, wherein the rudiments of the embryos are formed, and the only difference among them consists in the ovum of the one species being immediately conveyed by oviducts to the external world to be nourished, and in the viviparous by fallopian tubes to the uterus to be supported by the mother, in the manner we have described of the human body.

Gemmiparous animals, such as zoophytes and some articulated worms, which connect the two kingdoms, discover no distinction of sexes, and multiply like plants, by shoots on their surface, as has been accurately traced in the polype. The young issue in clusters from the side of this animal, appearing at first in protuberances, the size of a pin-head, which enlarge and put forth arms; and as they drop off, others succeed, and often push forth another generation before the first falls from the parent; but the most remarkable circumstance of this animal is, that on cutting it, every minute portion becomes a new animal, probably from an infinity of germs existing on its surface, in the manner of vegetable bodies.

Plants are propagated by seeds, or by buds analogous to seeds, in a way similar to oviparous and viviparous generations.

The seed containing the embryo, takes shelter, on the

appearance of winter, in the bosom of the parent of nature, and when the great birth-day of vegetable bodies approaches, its vegetative powers are roused to action by the stimulus of heat and moisture. After four or five days, the rosette of the seed, the living ens, sends forth a radicle like a white prominence, from the bottom of the seed, which subdivides into two or three smaller radicles, that strike downwards to form roots. Hence it appears that the radicle constitutes the plant, and that the stems, leaves, and flowers are only prolongations of the root, to prepare juices to characterize the species. The plumule, or rudiment of the stem, sprouts in a day or two after the radicle, from the same end of the seed, ascends upon its surface, and, in many instances, in less than ten or twelve days penetrates the husk, and assumes a leafy appearance. It is nourished during this period by the lobes of the seed changing to a saccharine matter, which is conveyed by vessels to the radicle, and from thence to the plumule, until the whole lobes are absorbed, and the plant sends forth the seminal leaves for respiration. It then prepares its own nutriment from the fluids of the soil and air. This process is, therefore, not unlike the birth of an *oviparous* animal.

In like manner, the embryo plant protected from the cold of winter in the *bud* of the tree, or *bulb* of the root, derives its nourishment from the circulation of the parent, like the *fœtus* in utero, and in the manner the *oviparous* plant does from the cotyledons of the seed. When the annual influence of solar heat returns, it is protruded through the bark to form shoots, which continue to receive nourishment from the parent tree after the offspring has arrived at the light of day. After this manner, the vernalization of germs, which every where exist on the surfaces of the branches and bulbous roots of plants, gives the vegetable kingdom inconceivable powers of reproduction, by a process of propagation, which is not very dissimilar to the gestation of a *viviparous* animal.—Jameson, on the Changes of the Human Body.

SHELLEY.

SHELLEY is by many accounted an atheist, because he said "There is no God." This, it must be confessed, is to all appearance sufficient evidence; but his own comment upon the text removes much of the offence of the abrupt and positive assertion. "This negation," he says, "must be understood solely to affect a creative deity. The hypothesis of a pervading spirit, co-eternal with the universe, remains unshaken." It is impossible for a poet to be an atheist; and Shelley was a poet. He argued very inconsistently, however, with this doctrine of a pervading spirit, when he tried to refute the external evidences of Christianity. It is a curious specimen of the *argumentum ad absurdum*, when a man begins by admitting a universal spirit the author of all things, and ends by proving, or trying to prove, that this universal spirit was not the author of Christianity. The following specimens of the poetry of his *Queen Mab* are curious contrasts to the infidel logic of the prose:—

"Spirit of nature! here!
In this interminable wilderness
Of worlds, at whose immensity

Even soaring fancy staggers,
Here is thy fitting temple.

Yet not the lightest leaf

That quivers to the passing breeze

Is less instinct with thee:

Yet not the meanest worm

That lurks in graves and fattens on the dead

Less shares thy eternal breath.

Spirit of Nature! thou!

Imperishable as this scene,

Here is thy fitting temple."

"Spirit of Nature? no.

The pure diffusion of thy essence throbs

Alike in every human heart.

Thou, aye, erectest there

Thy throne of power unappealable:

Thou art the judge beneath whose nod

Man's brief and frail authority

Is powerless as the wind

That passeth idly by.

Thine the tribunal which surpasseth

The show of human justice,

As God surpasses man.

"Spirit of Nature! thou

Life of interminable multitudes;

Soul of those mighty spheres

Whose changeless paths thro' deep Heaven's silence lie;

Soul of that smallest being,

The dwelling of whose life

Is one faint April sun-gleam;—

Man, like these passive things,

Thy will unconsciously fulfilleth: (!!)

Like theirs, his age of endless peace,

Which time is fast maturing,

Will swiftly, surely come;

And the unbounded frame, which thou pervadest,

Will be without a flaw

Marring its perfect symmetry."

FOREIGN ANTS.

Among the foreign ants, we may mention a small yellow ant of South America, described by Dampier, which seems, from his account, to construct a nest of green leaves. "Their sting," he says, "is like a spark of fire; and they are so thick among the boughs in some places, that one shall be covered with them before he is aware. These creatures have nests on great trees, placed on the body between the limbs: some of their nests are as big as a hog's head. This is their winter habitation; for in the wet season they all repair to these their cities, where they preserve their eggs. In the dry season, when they leave their nests, they swarm all over the woodlands, for they never trouble the savannahs. Great paths, three or four inches broad, made by them, may be seen in the woods. They go out light, but bring home heavy loads on their backs, all of the same substance, and equal in size. I never observed anything besides pieces of green leaves, so big that I could scarcely see the insect for his burden; yet they would march stoutly, and so many were pressing forward that it was a very pretty sight, for the path looked perfectly green with them."

Ants observed in New South Wales, by the gentleman in the expedition under Captain Cook, are still more interesting. "Some," we are told, "are as green as a leaf, and live upon trees, where they build their nests of various sizes, between that of a man's head and his fist. These nests are of a very curious structure: they are formed by bending down several of the leaves, each of which is as

broad as a man's hand, and glueing the points of them together, so as to form a purse. The viscous matter used for this purpose is an animal juice which nature has enabled them to elaborate. Their method of first bending down the leaves we had no opportunity to observe; but we saw thousands uniting all their strength to hold them in this position, while other busy multitudes were employed within, in applying this gluten that was to prevent their returning back. To satisfy ourselves that the leaves were bent and held down by the efforts of these diminutive artificers, we disturbed them in their work; and as soon as they were driven from their stations, the leaves on which they were employed sprang up with a force much greater than we could have thought them able to conquer by any combination of their strength. But, though we gratified our curiosity at their expense, the injury did not go unrevenge; for thousands immediately threw themselves upon us, and gave us intolerable pain with their stings, especially those which took possession of our necks and hair, from whence they were not easily driven. Their sting was scarcely less painful than that of a bee; but, except it was repeated, the pain did not last more than a minute.

"Another sort are quite black, and their operations and manner of life are not less extraordinary. Their habitations are the insides of the branches of a tree, which they contrive to excavate, by working out the pith almost to the extremity of the slenderest twig, the tree at the same time flourishing as if it had no such inmate. When we first found the tree, we gathered some of the branches, and were scarcely less astonished than we should have been to find that we had profaned a consecrated grove, where every tree, upon being wounded, gave signs of life; for we were instantly covered with legions of these animals, swarming from every broken bough, and inflicting their stings with incessant violence.

"A third kind we found nested in the root of a plant, which grows on the bark of trees in the manner of mistletoe, and which they had perforated for that use. This root is commonly as big as a large turnip, and sometimes much bigger. When we cut it, we found it intersected by innumerable winding passages, all filled with these animals, by which, however, the vegetation of the plant did not appear to have suffered any injury. We never cut one of these roots that was not inhabited, though some were not bigger than a hazel-nut. The animals themselves are very small, not more than half as big as the common red ant in England. They had stings, but scarcely force enough to make them felt: they had, however, a power of tormenting us in an equal, if not in a greater degree; for the moment we handled the root, they swarmed from innumerable holes, and running about those parts of the body that were uncovered, produced a titillation more intolerable than pain, except it is increased to great violence."

The species called sugar-ants in the West Indies are particularly destructive to the sugar cane, as well as to lime, lemon, and orange-trees, by excavating their nests at the roots, and so loosening the earth that they are frequently uprooted and blown down by the winds. If this does not happen, the roots are deprived of due nourishment, and the plants become sickly and die.—*Insect Architecture.*

EFFECTS OF ARDENT SPIRITS.

SOME of my readers may have made the remark, that the face of particular drunkards, at certain times, appears as much like a burning coal as any thing can well be

conceived. It was probably a face of this kind that suggested Shakspeare's description of Bardolph's nose:

"*Falstaff.* Thou art our admiral; thou bearest the lantern in the poop, but 'tis in the nose of thee; thou art the knight of the burning lamp. I never see thy face but I think upon hell-fire; but, for the light in thy face, thou art the son of utter darkness." When thou ran'st up Gadshill in the night to catch my horse, if I did not think thou hadst been an *ignis fatuus*, or a ball of wild-fire, there's no purchase in money. Thou hast saved me a hundred marks in links and torches, walking with thee in the night betwixt tavern and tavern; but the sack that thou hast drank me, would have bought me lights as good and cheap at the dearest chandler's in Europe. I have maintained that salamander of your's with fire, any time this two-and-thirty years."

Tumors and leprous eruptions, of various size and colour, appear about the nose and other parts of the face. The vigorous circulation, and determination to the head, may have some effect in increasing the disposition to these cutaneous affections; but I have some suspicion that they are induced in a great measure by the chemical qualities of alcohol, most likely by the evolution of hydrogen in the course of the circulation; and they appear in the face, where the superficial blood-vessels are more numerous than in any other part of the body. It is in these vessels that the hydrogen attracts oxygen from the atmosphere; the blood in them becomes preternaturally florid; the skin is thus excited and inflamed, and the spots appear in consequence. Darwin speaks of them as being sympathetic of diseases of the liver. Although predisposition may much assist here, yet, I think, from what I have observed, that a long use of spirituous liquors will cause the growth of these eruptions in any constitution whatever. There is no deformity incident to the human body more disgusting than this.—*Dr. Trotter.*

GENERAL NORTON, the Mohawk chief, who was in this country a few years ago, was asked by a professional gentlemen concerning the state of the teeth amongst the Indians. His reply was decisive upon this subject:—"When the Indians are in their own settlements, living upon the produce of the chase and drinking water, their teeth always look clean and white; but when they go into the United States, and get spirituous liquors, their teeth look dirty and yellow; and I have often heard that they were frequently afflicted with the tooth-ache, and obliged to have their teeth drawn."

WOMEN'S SOULS.—It is generally supposed that the Mahometans deny the immortality of the souls of women, because they are not present at public worship, and are not buried in the same burial-ground with men. But Mahomet was not so hard-hearted towards the ladies. The following passages are from the Koran:—"Whosoever doth good works, whether man or woman, and believeth, shall enter into paradise." (Surat xvi. 99; xiii. 23.) "They shall enter into gardens of pleasure, together with those of their fathers and wives that were good." (xlvi. 5). "Believing men and believing women shall enter into the heavenly paradise." (lviii. 12; lx. 12; lxxi. 11).

ORACLES.—At the oracle of Claros, Tacitus informs us, a man gave oracles, and they needed only to give him the number and names of enquirers, and then he retired into a grotto, and having taken some water from a fountain, he answered in verse to whatever the enquirer had in his thoughts, though in general he was a very ignorant fellow.—*2d Book Annals.*

MILK.—Dr. Prout, observing that milk was essentially composed of three ingredients, which he calls saccharine, oily, and albuminous (the first consisting of starches, gums, acetic acid, &c.; the second, of oils and fats, alcohol, &c.; the third, of animal matter and vegetable gluten), analysed the different species of food used by man, and found that, amid all his cooking, his sugar, flour, eggs, and butter, he was creating nothing but disguised imitations of the great alimentary prototype, milk, as presented to him by Nature. All food consists of at least two, if not all, of these elements; but in the artificial food, especially, this great model is followed instinctively. Thus man instinctively adds oil or butter to farinaceous food, and fattens animals with a view of combining the oleaginous with the albuminous principle. This is a beautiful illustration of types, or the successive stages of progress: each type or stage containing the elements of the succeeding under different aspects. Thus Judaism contained Christianity, and Christianity Universalism. It is only the milk of the word adapted to different ages.

HEATHENISM.—Jupiter is always represented by the ancients as subject to the Fates, and these Fates were both pious and impious. Thus Virgil, "*Infelix Dido, nunc te Fata impia tangunt.*" Wretched Dido, the impious or cruel Fates now press upon thee. These Fates were always represented as a trinity—Clotho, who holds the spindle; Lachesis, who spins the thread of life; and Atropos, who cuts it. This is the natural division of life and all being, into beginning, progress, and termination. The philosophers, however, regarded these personifications in their proper light, and represented the Fates as merely the council of divine wisdom. Jupiter thus became subject to the Fates as a wise man is subject to the dictates of his own judgment. "He himself (says Seneca), the author and governor of all things, has written the decrees of fate, but he follows them; he at once commands and obeys."

THE ANABAPTISTS.—The following outline of the doctrine of the Anabaptists of Germany, by Dr. Mosheim, will show that the very same ideas prevailed then as now, only in modern times a curious division has taken place between the political and religious portions of the doctrine—the spiritualists having preserved the one, and the materialists the other. "The church of Christ ought to be free from all crime; that all things ought to be in common amongst the faithful; that all usury, tithes, and tribute, ought to be entirely abolished; that civil magistrates are absolutely useless; that every Christian has a right to preach the gospel, and consequently the church has no need of pastors; and that God still continues to reveal himself by dreams and visions." This is the Community, or Social System in the ore, abused by the extravagant absurdity of repressing industry and all the dictates of human reason, to be guided by what they called a divine impulse, which produced the most mischievous consequences to themselves and others. But the life of the new world was there, although the organization was not sufficiently advanced for the important office of self-government.

RICH AND POOR PAUPERS.

Those whose minds have been moulded by the operation of the poor-laws appear not to feel the slightest scruple in asking to be paid for the performance of those domestic duties, which the most brutal savages are in general

willing to render gratuitously to their own kindred. Why should I tend my sick and aged parents when the parish is bound to do it? or, if I do perform the service, why should I excuse the parish, which is bound to pay for it?

At Princes Risborough we turned over the minute-book of the Select Vestry, and found the following entries:

"Samuel Simmons's wife applied to be allowed something for looking after her mother who is confined to her bed: the mother now receives 3s. 6d. weekly. To be allowed an additional 6d. for a few weeks."

"David Walker's wife applied to be allowed something for looking after her father and mother (old Stevens and his wife), now ill, who receive 6s. weekly. To be allowed 1s. weekly."

"Mary Dacey applies for something for waiting on her mother, now ill. Left to the governor."

"Elizabeth Prime applies to have something allowed for her sister looking after her father, now ill. Left to the governor."

We shall conclude these selections with an extract from the evidence of Mr. Thomas Raymond Barker, a gentleman who has taken great pains in administering the parochial affairs of Hambledon. He says,

"In the year 1824 or 1825, there were two labourers who were reported to me as extremely industrious men, maintaining large families. Neither of them had ever applied for parish relief. I thought it advisable that they should receive some mark of public approbation, and we gave them 1l. a piece from the parish. Very shortly after they both became applicants for relief, and have continued so ever since."

Mr. Barker stated that he was not aware that any other cause existed for this change in the conduct of these two men, than the above-mentioned gratuity.—*Mr. Cameron's Report from Buckinghamshire.*

[If Mr. Cameron were to put himself to the trouble of looking over the books of another "select vestry" at the Treasury of the United Kingdom, he would find many similar entries of a more hideous character, and amongst the rest, "The Duke of York to be allowed 10,000l. per annum for paying a monthly visit to his aged father." This rich pauper refused to do an act of filial duty without being paid for it; and he even grumbled, like all other paupers, at the smallness of the allowance. The spirit of pauperism is the same in high and low life—very modest and independent at first; as impudent as the devil at last.—*Ed.*]

IMMORTALITY.

The subject of P. A. S.'s letter is one of the most important, and certainly the most sublime, that can engross the attention of the finite being; and for that very reason we have always spoken of it with great caution, resolved, before we addressed ourselves formally to the task of critical analysis, to build a good subterranean foundation of elementary principles upon a universal base, after which we shall arrive at the doctrine of individualism, to which the subject of "the immortality of the soul" especially belongs.

Hitherto we have aimed at the demonstration of the life of Nature, or God, the universal Being, without form, without circumference, but comprehending within himself all form and all circumference, without the life of external sensation, inasmuch as he is without external senses or organs of sense, and inasmuch as he can have no perception of any thing beyond him; but possessed of active infinite intelligence, which, by its own creative

imagination, generates within the immensity of its own nature all the machinery of individual life and organization—a life which is the very opposite pole or extreme to that which we possess; a life which we cannot comprehend, but must acknowledge, unless we entangle ourselves in a more ravell'd thread of absurdity than even incomprehensibility itself.

The individual life is characterised by this peculiarity: 'The impressions come from *without*.' God is therefore 'mind with *internal* senses;' and man 'is mind with *external* senses.' This is the true generic distinction, although we cannot comprehend either; and it certainly cannot seem very wonderful that the life of God should be a mystery, when the life of man, of our ourselves, is infinitely beyond our understanding.

Having established the life and immortality of the great original, the infinite and the universal, we come in due order of time to the subject of the life and immortality of the individual. The argument divides itself into two, namely, the *possibility* and the *probability*. The possibility cannot be reasonably disputed by any man, not even by an atheist or thanatologist (*death philosopher*); for it is quite as possible for the particles of matter to assume a more refined and spiritual form as a gross and corporeal form; quite as possible for sylphs, and invisible, intangible beings, to be created by the influence of circumstances, as for such subtle elements as light and magnetism, and other spiritual substances, to move through the wide expanse of Nature, and penetrate the most solid bodies, without themselves affording any resistance to matter. When all Nature is a mystery, and not a single cause or effect *understood*, but merely a few circumstances *known*, how can it be reasonably said that one thing is more possible than another, unless the latter involve an arithmetical or mathematical contradiction? This contradiction is not involved in the doctrine of the immortality of the soul, even upon the principles of atheism itself; and therefore no man can dispute our first proposition, namely, the *possibility* of individual immortality.

We come now to the *probability*. This is manifest from the nature of the human soul itself. It exhibits the type and earnest of immortality in its own nature. There is a general species of immortality which belongs to all nature; and there is an individual species of immortality which belongs to organic nature in particular, in the reproduction of the specific individual for ever. An acorn has the spirit of immortality within it, inasmuch as it can generate acorns as long as our planetary nature continues her present modes of action. A dog, a horse, every animal, has this species of immortality, which is that of the succession of the species, and man has this immortality in common with others; but the individual is mortal and perishable, whilst the species is everlasting. Were we to look no farther than this sensual, carnal view of human nature, we should say it is all over with man when his body is disorganised; but man is specifically distinct from every other organic being. Man has within him a principle which grasps infinity and eternity, as if they were his birthright, his paternal and maternal inheritance. He alone can travel mentally and spiritually to the extremities of time and of space. He lives not the life of an individual only, like a dog, which is not influenced by the conduct or experience of other dogs, and can neither reflect upon the history of the past, nor anticipate the future. Man lives the lives of the species and the individual *in one*; he borrows the mind of his neighbour, and lends him his own in return; the mind of his ancestor is still alive to him, and *his* will be living in human society when his body has crumbled into

dust. Thus there is a universality about the life of a man which no other finite life possesses; a mental life, which embraces infinity and eternity. So far, then, we have demonstrated that the mind of man is less finite and less mortal than that of any other species of animal.

We shall finish the remainder of the argument next week.

CORRESPONDENTS.

We entirely overlooked W. L. last week, till our answer was too late for insertion. Nitrogen is found both in opium and in animal matter, but it is now pretty generally believed that nitrogen itself is merely a compound of carbon, oxygen, and hydrogen, and we have no doubt that future analyses will demonstrate the compound nature of all the known gases. Matter is infinitely decomposable. There is no ultimate material element, no original atoms, to whose variegated union we can ascribe all the phenomena of the outward world. Hence we may with strict propriety say, not only that animal matter and opium are composed of the same ingredients, but in fine all matter is merely a compound of the two elementary spirits of Nature. We may have some idea of the possibility of this from the five known compounds of nitrogen and oxygen. One of oxygen and four of nitrogen make common air; one of oxygen and two of nitrogen make intoxicating gas; one and one make nitric oxide; three and one make nitrous acid; and five and two make nitric acid, or aqua-fortis.

G. N. enquires what becomes of nitrogen in respiration? We answer, that part returns in expiration, and part must be absorbed by the absorbents of the system, inasmuch as it is found to be an essential ingredient of animal matter; if we cannot clearly trace its course, it is because our scientific skill has not yet attained sufficient penetration. The subject is yet a puzzle to our experimental chemists. Suffice it for us to say that it is in the air, and it is in the body; and chemical analysis is yet so imperfect, that a gas may enter into an unknown combination, and escape the observation of the analyst, by assuming the character of what he considers a simple body.

Mr. R. has associated his subject too much with an authority which is questioned by many. To build upon the broad basis of Nature is the only successful mode of teaching now—let any finite or party production be used as a staff only.

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 13th inst., at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Bready, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 34.]

SATURDAY, APRIL 18.

[Price 1d.]

SYSTEM OF NATURE.

If we could possibly invent a system of society in which the selfish and the social spirit would so intimately combine, that the expression or exercise of the one would be tantamount to the exercise of the other, we might with strict propriety be said to have invented a system of political perfection. This is the "*beau ideal*"—individualism and universalism in one.

At present we have got individualism without universalism. Each individual is left to himself, a straggler in society; a being whose movements are known to himself alone, and whose conduct is only watched and questioned by the ministers of justice, when it seems likely to be productive of mischief to others. As long as he does no harm, he is his own master, and responsible to no one. In fine, one of the most striking features of this present system of society is non-responsibility or freedom of action. We are never taught, either by education, or by the laws and practices of the country, to consider ourselves as servants of the public. Our whole business in life is to accumulate individual property, and to promote individual interest. No account is taken of our proceedings; no general register is kept of our names, our dwellings, and our modes of occupation; no public use is made of our talents; no concerted plan of action is pursued, by which the whole mass of public mind may be concentrated upon the main point to which society should ever direct its attention—universal good.

In one sense this is liberty, inasmuch as no one controls our movements, provided we do not injure their persons or property; but in another sense it is slavery, inasmuch as we become the slaves of one another. Every man we meet is a tyrant, for he has always something collected around him, either land or moveable property, which it is illegal for us to touch or appropriate; and thus we live in a land of tyrants, where every man is both master and slave to his neighbour.

We may call it what we like, liberty or slavery; it matters not; both terms are equally appropriate, and equally incorrect; for there is no such thing as slavery or liberty in the abstract sense of the word, nor is there more of good or evil contained in the one idea than in the other. A species of refined slavery is the very perfection of society, in which all men are bound by a moral sense of duty to become the servants of one another; and true liberty is that state of refined sensibility in which the will of individual selfishness becomes identified with the love of our neighbour. There is too much liberty at present; that is, the moral tie that ought to bind together

the members of human society is not sufficiently strong, and on that account we are obliged to employ a substitute for the moral law, namely, the law of the magistrate and the police-officer, to supply its place.

The moral law is the goal to which society is progressing. The perfection of society consists in a complete abandonment of the political or magisterial law. But perfection is unattainable: it can only be held up as a model for our imitation, a standard for estimating the degree of progress to which we have attained. But although perfection be unattainable in the extreme sense of the word, there are degrees of perfection; and moreover, there is a faint line of distinction between the system of division and discord, and the opposite system of union and harmony. That line of distinction forms the boundary of the old and new worlds.

To pass that line of distinction, it is necessary to new-model the entire system of government. It is necessary to number the people, to gather them into tribes like the children of Israel, according to their respective modes of life, and to keep an exact register of all their names, so that no man shall be lost in society; no man be without a tribe, without a class, without a department of industry, in which his character is known, and to which he is ever responsible for the employment of his time. By this registry he loses his liberty; he is no more his own master, to roam abroad over hill and dale, through cities and towns, to haunt the lurking-places of depravity, and plunder unseen the produce of industry. He can no longer act the part of an impostor; for in every town, every city which he frequents, his name and character is as well known as it is in his native village. He can only travel as an honest man: disguise must be attended with immediate detection and infamy.

Such is the character of political universalism; and it is accomplished by a very simple process. In a state of ignorance, such a system is impossible, because it requires the very highest refinements of art and science; therefore there is no use in putting the question to us, Why was not this accomplished ere now? It is a childish question, and too foolish to deserve a reply. But now, when the facilities of social intercourse are brought to such perfection, when we can travel with greater rapidity than the pigeon can fly, and carry on conversation with our fellow-men in all parts of the habitable globe,—nothing more is necessary to regenerate political and social life than a classification of the people and a strict system of registry, for all their public movements and employments. By this registry it will be known at once how every individual employs his time; what is the

amount and quality of his labour ; and what are his public and his private character. Whenever he moves he shall carry his passport along with him, so as to be known at once in every spot of the world which he visits. If ever he should be guilty of political misdemeanour, his passport will be withheld. If it should prove a forgery, it is high treason against his species, and will be punished according to the spirit of the age.

The effect of such a system would be overwhelming. It is a moral inquisition ; and without a moral inquisition, save the world who can. This system is the extreme opposite of the present. It is a system which links the individuals which compose the species together into a compact concerting body, whose members communicate with one another like the atoms of the human frame. To extend such a refined and scientific system of legislation will require many generations ; but in such a country as England the scheme would be comparatively easy, and so moralising, so ameliorating in its tendency, that the mere formality of a passport, if necessary at first to correct the depraved and villanous propensities of the old system, might speedily be entirely dispensed with.

It can only be by some such system as this that unity can be accomplished. We will not enter more minutely into detail upon the subject, because, in the first outline of any project, it is necessary to confine ourselves almost entirely to generalities, confiding the particulars to the imagination of the reader. In recommendation of the adoption of such a system of political intelligence, it may be remarked, that the moral power is always strongest where the individual is best known, and his conduct most strictly scrutinized. The thief and the swindler always prefer those places of residence where they are entire strangers by name and countenance ; and the man of rank and fortune is extremely nice in his behaviour in whatever portion of the world he resides, because his circle of acquaintance is wide, and there is every chance of detection and exposure, if ever he should degrade his character by any mean or fraudulent action. It only requires a little more refinement and universality to make the law of honour, which now prevails amongst the higher classes, sufficiently powerful to establish public tranquillity and contentment. It is not universal at present, because it only includes a class, and legislates for a class. A nobleman or gentleman is strictly accountable to his order for his behaviour to every individual of his order, and therefore preserves the most punctilious decorum in the company of his equals ; but the law of honour does not comprehend the poor ; he may vent all his long imprisoned spleen upon the working man, and exercise any species of barbarity to which his despotic temper is disposed, without being liable to an arraignment for his behaviour before the tribunal of the honour of a gentleman. Still the principle of a perfect law is dimly seen through the thin shadow ; and that principle extended to the species, is the great desideratum of the philanthropist.

Moreover, we think that the establishment of a real tribunal of honour will very soon be found extremely conducive to the well-being of society. This tribunal of honour would be the necessary consequence of a classification of the people. The privacy with which all trans-

actions are at present conducted is a kind of passport for roguery ; and when one individual imposes upon another there is in general, unless it amount to a civil crime, no public official exposure of the transaction upon which we can depend. One individual informs another ; the story flies about like private scandal, and we either turn a deaf ear to the tale, or remark that it is the way of the world, and much may be said on both sides. We thus cultivate villany by the system of liberty as we call it ; such liberty as enables a man to sneak like a thief through the world, without giving an account of his proceedings to any one, unless he becomes a felon in the eyes of the law. But the actions of which the law takes cognizance are not the worst actions of mankind. Much greater mischief is occasioned by those which no civic officer can punish, or even challenge. For these actions there is no law and no punishment ; they are merely subjects for private scandal ; and the information is so defective, that the greatest villain can shelter himself under the allowance which is always made for defamatory tales. All those actions would be exposed by means of a classification of the people. The behaviour of tradesman to tradesman, of merchant to merchant, and of each to the public in general, would be strictly scrutinized, and no other punishment required than merely publication of the evidence in the public journals. The moral law requires no more. It lets the prisoner loose upon society, which must, as it improves, become more and more a prison to the detected scoundrel. This is the way to reform the trade and the morals of the country.

But even such a system as this, which we have described, is only a step in the graduated scale of ascent to the *beau ideal* of perfect socialism ; a state to which we must for ever be advancing, and for ever discovering a new horizon in the distance. The system of national classification is the beginning of political universalism ; but it is a system which is susceptible of indefinite improvement ; which will for ever be superinduced upon the original model, as the people advance in intelligence and morals.

This system existed in the bud in the political divisions of the old world. The Roman citizens were divided into thirty-five different tribes, and registered accordingly. With them it was subject to all the imperfections inseparable from an immature state of progress in science and art ; but that wise and politic people perceived the necessity of a general classification to give vigour and efficiency to their combined proceedings. There is no comparison between the system pursued by the ancients and that which we anticipate, but the name. The old classifications were invidious distinctions, which ranked a man in a higher or lower scale, according to the amount of property which he possessed, or the nature of his family connexions. We anticipate a system of universal amalgamation, in which men shall be ranked according to their pursuits in life, without any reference either to their talents or their property, and without any restrictions by which they shall be confined to any particular caste, beyond the limits of their own good pleasure.

THE SHEPHERD.

ON MENTAL DISEASES.

LETTER III.

Amor, ch' a cor gentil ratto s' appende.—Dante.
Love, which quickly moves a gentle heart.

THE faculties of perception, the creative power of imagination, together with the deepest feelings of human nature, are at work when passions take a strong hold in our bosom. When these passions are violently opposed, or otherwise frustrated in their aim, the mind is too often exposed to fatal derangements. Among the passions, however, which most powerfully predispose to insanity, none is so dangerous as love; consequently, love particularly deserves our attention. But what is love; how does it originate; and by what means can the medical art cure the mental diseases which are caused by love?

The generality of modern writers, immersed and drowned, as it were, in the mire of materialism, have endeavoured to spread abroad the absurd idea that love is nothing but that want of sexual intercourse which the human being has in common with the brute creation. The political economists, the rationalists, the philanthropists, have laboured in common to establish this erroneous idea. This fallacy had done more harm to the dignity of human nature than all the despotism of church and state put together: it has destroyed the purest source of happiness, and sacrificed many thousand victims to the cowardly selfishness of cold-blooded profligacy.

The human beings, male and female, are each but the halves, the poles of the one perfect human being. Both are endowed with peculiar faculties, which make them seek each other, in order to form a unity of feelings, sentiments, and actions. The man wants gentle, tender sensibility; the woman strength, courage, inflexibility. There is nothing more monstrous in nature than an effeminate man, or a masculine woman: they are hated and despised by both sexes. But the man loves the woman for the qualities which he does not possess: the woman loves the man for the same reason. But these qualities exist in the different sexes in different degrees; and each individual has but one counterpart which exactly responds to his individuality. This being the case, and the number of male and female being on the average the same, the human race is evidently destined by nature to live in couples, in order to fulfil its destination.

Polygamy and polyandry, or community of men, or community of women, are crimes against nature. The union for life of the couple is the eternal law of human perfectibility; or, when a man or a woman finds within their own bosom that an individual of the opposite sex possess those qualities which appear to respond to the wants of his human nature, that is, to possess feelings, sentiments, and energies, the deficiencies of which make each insulated being imperfect and unhappy, then love flies abroad winged; then these qualities, clothed in the most vivid colours by the creative power of the imagination, stand before our eyes as the aim and end of all our happiness.

Love, and all the nobler qualities of mankind, lie concealed and dormant in the first stage of human society.

Man without education is apparently the most helpless, ignorant, and brutal of all animals. And yet our pretended philosophers are so stupid as to seek in the state of nature for the *beau ideal* of human perfection. The fools! as the diamond before divested of its outward crust, and cut and polished by diamond, presents nothing but the appearance of a common pebble; so also man, without the help of civilization, presents nothing but his animal nature. Yet there is a diamond in us, the spark of a divine spirit, and this divine spirit is even manifested in love; because love is not to be found among savages; love is, for those mole-sighted fact-mongers, a mere artificial produce, matrimony an invention of designing priests, and purity a mere hypocrisy. Let us pity the ignorance of those miserable chattering!

Love is the offspring of our perfectibility; the happiest energy of our nature, if well directed and satisfied. But in the state of over-refinement in which we live, the defective education that some receive, the deceptive disguise that many assume, the prejudices of rank and fashion, the miseries which arise from the contrast of luxuriant opulence with starving poverty, all these circumstances make love the cause of the most hideous crimes, and of the most horrible mental disorders.

O, ye doctors, where are your drugs for such diseases? are they to be found in the nervous or in the vegetable kingdom?

The general form under which disappointment in love manifests itself, is melancholy, with loss of appetite. The stupidity and brutality of unfeeling beings laugh at these first symptoms of human misery, or even employ rigour and austerity, sarcasm and contempt, to counteract the effects of love. These means have often driven to suicide or madness. I have saved many, with a quite opposite method; indeed, I can lay down here as the first rule to cure mental diseases, that in order to bring the mental faculties into harmony, the doctor must identify himself with the particular mode of thinking and feeling of his patient; he must strive to elicit in him a confidence that there is a human being that feels equally with him. If he succeeds in creating this sympathy, he can save his patient.

Once I was on a visit to a gentleman, who had an only son, who was afflicted with melancholy, bordering on madness. I took a great interest in the young gentleman, who was in all respects amiable and well-bred, and I resolved to make a trial to cure him. I communicated my plan to his father, who promised me his assistance. One day, watching the moment that his son was a little better, he told him that I was afflicted with melancholy and insanity, and begged of him to try to elicit the cause of my malady, and to endeavour to alleviate it with his kindness. The affinity between both was thus soon established. As soon as I had made him acquainted with my fictitious sorrows, he communicated his real ones to me. It was an unfortunate love affair; both rank, fortune, and several other circumstances, were in opposition to his wishes. Well, said I, if we cannot obtain our wishes as gentlemen, we must learn some handicraft, and become independent mechanics; we can thus live with the earnings of our hands.

We continued discussing our plans, and planning our future course of life. After a few days' conversation I induced him to become a gardener, as his paternal estate gave him the opportunity of learning this art without further trouble than that of putting himself under his own gardener's tuition. The sympathy between us, the new plan of life, the exertions in gardening, had the desired effect; my young friend was restored to health.

The second rule which can be drawn from this instance is, that as soon as the affinity is established, some plan must be formed to call the energies of the mind and of the body into full exertion. This plan, however, must be in strict relation to the ruling passion.

I cured a female friend, who had lost her lover in a battle, and had become insane, by persuading her to learn to paint, in order to possess a picture of him at full length. This occupation gave to her mind a new turn.

But I may be asked, how can a man come into such affinity with an insane person, how can he exercise any influence upon a mind already diseased? He can do it through the magnetic influence of benevolence, moved by the spiritual power of the will, without any other instrument but the eye, which communicates to the insane, particularly those whose insanity is caused by love, the inmost thoughts of the soul. Those spiritual means are not always sufficient. Sometimes this kind of insanity has ruined the digestion; sometimes caused inflammation of the brain; in other instances it affects the whole nervous system. In such cases a methodical scientific medical treatment is necessary.

The next letter will contain something more upon this important subject.

THE ALPINE PHILOSOPHER.

TITHE.

"OF all institutions," says Paley, "adverse to cultivation and improvement, none is so noxious as that of tithe. A claimant here enters into the produce who contributed no assistance whatever to the production. When years, perhaps, of care and toil have matured an improvement, when the husbandman sees new crops ripening to his skill and industry, the moment he is ready to put his sickle to the grain, he finds himself compelled to divide the harvest with a stranger. Tithes are a tax not only upon industry, but upon that industry which feeds mankind—upon that species of exertion which it is the object of all laws to cherish and promote."

With regard to the payment of tithe in Ireland, all denominations of the people are unanimous in deprecating it, not on the principles of injustice alone, but of inexpediency. The feeling which exists in this respect, is not that silent sense of dissatisfaction which would imply a passiveness in payment, accompanied with unwillingness; it is one of a more deep-rooted and resentful character, such as ever attends the abstraction of property against the owner's consent. However established by time, custom, or legislative sanction, it still is felt as an oppression, and serves to keep alive discontent, and an earnest desire to get rid of it altogether.

Tithe has in its train many evils which deeply affect

the interests, both of the clergy and people. The demand is in itself odious from its injustice; and this is so obvious, that, in order to avoid the personal pique and annoyance which is almost sure to arise in the collection, the disagreeable duty is commonly transferred to a valuator or proctor, who becomes thereby empowered to institute an expensive process in the name of the incumbent; and the character of this agent, who is usually of the lowest class, and, perhaps, notorious for crooked scheming and unblushing villany, not unfrequently communicates its taint to his employer. Hence a new source of misery to the people, and of hatred to the system; for the sins of the servant are, in most instances, placed to the account of the master, whilst execration is unsparingly dealt out in return for oppression.

In a worse situation, if possible, stands the concern when tithes are let to farm. The multiplied mischiefs which this practice produces are finely depicted in the immortal eloquence of Grattan:—"From a situation so ungracious, from the disgrace and loss of making in his own person a little bargain with squires, farmers, and peasants, of each and every description, and, from non-residence, the parson is obliged to take refuge in the assistance of a character, by name a tithe-farmer, and by profession an extortioner; this extortioner becomes part of the establishment of the church by interest and situation. There are two descriptions of men he is sure to defraud; the one is the parson, the other the people. He collects sometimes at fifty per cent.; he gives the clergyman less than he ought to receive, and takes from the peasants more than they ought to pay; he is not an agent who is to collect a certain rent; he is an adventurer, who gives a certain rate for the privilege of making a bad use of an unsettled claim—this claim over the powers of collection; and what is teasing or provoking in the law is, in his hands, an instrument not of justice but of usury. He sometimes sets the tithes to a second tithe-farmer, so that the land becomes a prey to a subordination of vultures."

In one instance, related on authority, in an opulent and fertile part of Ireland, the property of a nobleman whose name is not permitted to be mentioned, a beneficed clergyman had his tithes, amounting to six hundred pounds, collected by a tithe-farmer, who levied on the people one thousand three hundred every year. The parishoners, anxious to relieve themselves from such an imposition, proposed to raise the tithe themselves to the rector to eight hundred pounds, and get rid of the "extortioner;" but the offer was declined, unless the latter were secured in an equal sum upon the same tithes! Embarrassments so disgraceful to the clergy as this, created by the villany of tithe-agents and tithe-farmers, are not uncommon; and this case forms but one link in those heavy chains that trammel intellect, respectability, and industry, in a state of inactivity worse than useless.—*Reid's Ireland.*

ANIMATE AND INANIMATE LABOUR.

It seems to be a pretty general belief at present that animate labour will, in a great measure, be superseded by inanimate labour; that the tendency of progress leads

directly to the employment of the elements of Nature, such as steam, air, heat, &c., as substitutes for muscular and human power. Our doctrine of progress leads us to question this general belief by reminding us that in the gradual development of the human faculties we must be for ever raising and refining the character of the animal nature by occasional intervals of apostasy, from which, after a little experience, we return, like prodigal children, with new and more enlightened ideas respecting the latent virtues of volition and animal power. There is a species of rivalry between animation and inanimation in Nature; and we do not suppose that either party will ever consent to acknowledge itself entirely defeated. The energies and capabilities of the human body are not yet known, nor indeed can they ever be known; they will for ever compete with the power of the elements, and the elements with them, so that we may expect a succession of changes, in which men will pass from animate to inanimate labour, and from inanimate to animate, each new stage being a refinement upon the past, and to all appearance a final victory. The employment of steam in travelling is generally accounted so superior to human labour that rivalry between the two powers has been considered preposterous and absurd; but we have little doubt that an age is coming when the improvement of machinery will supersede the use of steam itself, and substitute, for a season, human labour instead of inanimate power. In proof of this we may advert to the improvement of Mr. Snowden on railways and railway carriages, in the use of rack-rails and cogged wheels, and Mr. Ward's improvement on Mr. Snowden's plan, namely, the substitution of manual for steam power.

The following is from the pen of Mr. Buckingham, member for Sheffield, upon the subject:—

"The great national advantages to be obtained by Mr. Snowden's inventions, and their vast superiority over all others hitherto discovered, may be comprised under the following heads, viz.:

"The expense of the railway is reduced to little more than the cost of the iron; and the first cost of the propelling carriage, instead of being 1000*l.*, as is the case when steam is used, would not exceed 100*l.*, and the wear and tear be comparatively trifling. These alone would give his inventions a substantial claim to public support, facilitating as they do, in a most extraordinary degree, the general extension and use of railroads throughout the country; and when viewed with reference to the employment of manual labour, their value surpasses all calculation; they then diminish the first cost of vehicles to be used on the railway to a mere trifle; they do away altogether with the expense of fuel and the inconvenience of smoke; explosion and danger are rendered impossible; and the unemployed labourer is supplied with an inexhaustible source of remunerating employment, not solely on the score of humanity, but because it will be found both the cheapest and the best.

"It is well known that much attention has been bestowed, and vast sums expended, in endeavouring to substitute inanimate for any other power of conveyance; but hitherto no one has contemplated the immeasurable advantages which would ensue, by displacing horses from the conveyance of goods and passengers, and substituting in their place manual labour; yet this truly desirable object is now fully capable of being accomplished, and only

requires to be duly aided by patriotic and influential parties, desirous of conferring so great a boon upon their suffering countrymen, and insuring abundant employment for the industrious classes, and 'opening up to more distant parts of the empire the sources of wealth and industry;' whilst it will effectually abolish the many cruelties that are at present inflicted on that noble animal the horse, particularly those connected with overdriving, to keep time in our mail and stage-coaches.

"It is a received opinion that steam power cannot be used economically in preference to horses, when the rate of travelling is less than four miles an hour; and it is an indisputable fact, that horses employed as they now are in stage-coach travelling, are unable to compete with steam power, either profitably or in point of speed; and this arises from the circumstance of the animal being forced to do his work in so short a period of time as soon to ruin his constitution; permit the horse, however, to proceed at an easy pace, and he will work eight or nine hours per day without the least injury to himself, live three times as long, if well treated, and yield ample profit to his owner.

"The result of every examination of the subject, hitherto, has been a decided opinion, that steam power must be necessarily more economical than horse power, where velocity is required; now the truth is, that by an easy adaptation of animal power, it far excels steam power in economy, and is quite equal to it in speed. Nor is this circumstance so extraordinary as at first sight it may appear; for it has been admitted that horses can work cheaper than steam locomotion, when travelling at or under four miles an hour: an admission which is decisive of the position now advanced. In both instances, of the horse or locomotive engine, it is the rapid travelling that causes the great expense: in the case of the animal, he is soon destroyed; and in practice we find the wear and tear is exceedingly great of a ponderous and a very complicated machine, weighing from seven to ten tons, and travelling occasionally at a speed of twenty-five miles an hour, frequently rendering the engine out of repair, and consequently in its use entailing very heavy expenses. To obviate these difficulties, the inventor of the improved railway and carriage, has arranged the machinery in so effective a manner, that if propelled by manual labour, the men employed would perform their work whilst sitting, although the rate of travelling by the carriage would be twenty miles an hour; when the carriage need only be one-tenth of the weight of those now used, and the machinery being so extremely simple, the wear and tear would be reduced in proportion, as well on the carriage as upon the rail; and it is certain that, with reference to economy in slow motion, as well as quick travelling, Mr. Snowden's invention will be found to maintain the same preference.

"Independent of the incalculable advantage contemplated by the introduction of Mr. Snowden's invention of railway and carriage, in dispensing with the necessity of levelling the country; together with its importance in giving immediate employment to man, instead of horse or steam power; it is capable of being satisfactorily shown, that fast travelling can be attained much more economically by manual labour, under every view of the question, than by steam locomotion, and hence the great object sought after is now attained—that of securing employment for the many individuals seeking for work, but looking for it in vain.

It is too generally contended, without duly considering the enormous expense thereby incurred, that cutting down hills and filling up valleys is the *only* method of con-

structing railways with advantage to the capitalist; some writers, treating on railways, have gone so far as to assert, that the moment a hill of even very trifling ascent is to be overcome, all advantage of a railway over that of a common road from that time ceases. Nothing can be more erroneous; it is, in fact, assuming the impossibility of propelling carriages with their merchandise up the inclined plane. It being proved that it is possible to propel the carriages up an inclined plane 1 foot in 12, it may be asked, whether the labour expended in cutting down the hills and filling up the valleys, would not be more profitably employed in the conveyance of passengers and goods? It is certain that all labour unprofitably employed is a waste of money which *never* can be recovered; in the construction of the London and Birmingham railroad five years probably will elapse ere any returns are made, and the outlay labour exceeding 1,500,000*l.* (independent of other charges incidental to the levelling system); the interest on such outlay for labour at 5 per cent. is 75,000*l.*, an annual charge upon the undertaking, amounting to more than would be required by Mr. Snowden's plans, for the supply of the labour or motive force by man, for the transit of all the traffic over hill and dale, at a velocity averaging twenty miles an hour, passengers being charged 1*d.* per mile each, and goods at about 1½*d.* per ton per mile, when the Liverpool and Manchester charge is 5*s.* or 2*d.* per mile for passengers, and 7*s.*, or 2½*d.* per ton per mile for goods. Mr. Ward concludes by saying:—

“I feel that in bringing this most important subject before the public, I am only performing an imperious duty, and having done my part, it remains for the Government to do theirs also; by giving every facility and the utmost encouragement to the extension and general use of a means which will so largely promote the trade, manufactures, and commerce of the country; and which above all will carry content and comfort to every fireside. In the same feeling I also call for the best aid of every patriotic and influential individual in the empire, and more particularly upon the landed proprietary, to give their undivided assistance in advancing by this means the well-being of society. But let me be rightly understood: I require neither of the Government, nor of any individual, to be satisfied with the averments of Mr. Snowden, the inventor, or with the statements made by myself, as the commentator upon his inventions. What we require is, that a fair trial shall be made, when Mr. Snowden will be able to demonstrate the great superiority as to efficiency and cheapness of his railway, and I shall be enabled to prove the still greater cheapness, safety, and perfect efficiency of my substitution of manual labour for steam power; and that by its general introduction there shall no longer be pretence for saying there exists a redundant population; neither will any willing labourer be afterwards driven to participate the pauper's mess, for want of remunerative employ; but on the contrary, the whole body of society will receive a new and vigorous impulse, that cannot fail to diffuse health and happiness to all. Mr. Snowden and myself are solicitous to submit the merits of the inventions to such an impartial test, as may be conclusive: and if I shall be the humble instrument of rendering so essential a good to my country, it will be my proudest boast, and my ample reward.”

OLD POOR LAWS.

“Some time ago there was a shoemaker, who had a wife and family of four children, who demanded relief of the

parish, and obtained an allowance of 5*s.* per week. He stated that he worked for Mr. Adderley, the shoemaker, who now lives in the High-street in the Borough. The man stated, in applying for relief, that, however he worked, he could earn no more than 13*s.* per week. A respectable washerwoman informed me, that the way in which this family lived was such, that she was convinced the man earned enough to support them honestly, without burdening the parish, and that it was a shame for him to receive relief. In consequence of this information I objected to the allowance; but one of the overseers, taking up the book, said, ‘But here is the account, signed by Mr. Adderley himself; can you doubt so respectable a man?’ Still I was not satisfied; and I watched the man, and found him going to Mr. Pulbrook's, in Blackfriars-road. When the man quitted the shop, I went in and asked whether the man who had just left worked for them. Mr. Pulbrook stated that he did work for them, and had done so during the last twelve months: that he was one of the best shoemakers who had ever worked for him; that he earned only about 12*s.* a week, and that he (Mr. Pulbrook) regretted he had not more work for him. The man had left his book, which I borrowed. When the man came to the board, I said to him, ‘Do you know Mr. Pulbrook, of Blackfriars-road?’—‘Yes, I do very well.’ Do you ever work for him?—‘I have done a job now and then for him.’ I then asked, whether he had not earned as much as 10*s.* or 12*s.* per week from him. His reply was, ‘No, never.’ I then produced the book between him and Mr. Pulbrook, from which it appeared that he had earned from 10*s.* to 12*s.* per week for the time stated. This took him by surprise, and he had no answer to make. The relief was refused him, and he never came again. I afterwards ascertained, that, in addition to the 13*s.* a week which he earned from Mr. Adderley, and the 12*s.* a week which he earned from Mr. Pulbrook, his wife and himself worked for Mr. Drew, the slopseller, living at Newington-causeway, and earned 7*s.* a week from him. On the average of the year round they did not earn less than 30*s.* per week. The man was afterwards spoken to about the loss of the parish allowance, when he said,—‘I did not like to lose it: it was a d—d hard case; it was like a freehold to me, for I have had it these seven years.’

“No inspector would have found out such a case except by constant watching or favourable accidents. It might be supposed strange that a shoemaker could have earned no more than 12*s.* a week; but his answer was, that his bodily infirmities were such, that he could not sit long enough to enable him to earn more than such a sum. This morning, I said to a man of the name of Taylor, a tinman, who is receiving 4*s.* a week,—‘Taylor, how can you come here and waste your time to get your lazy shilling, whilst, if you stayed at home, you might earn your honest eighteen-pence, and set your family a good example?’ His reply was, ‘I have no work; I can't earn any thing.’ I answered, ‘Why, every time I pass your house, except on relieving days, I always find you hammering.’—‘Yes, so I may be—penny or two-penny jobs: will you find me work?’ I replied, ‘That I could not seek pans to mend for him.’ He went away with his money. Had I positively challenged this man, the first question with the annual officers would have been, ‘What is your family?’ ‘There are six of us,’ it would be replied. ‘What a family for a poor man to maintain!’ exclaim the overseers; ‘let him have the money.’ The overseers are in perpetual fear of a man with his wife and family coming into the workhouse.

They usually say, in such a case as this, 'We pay 4s. per head for their keep in the workhouse; here is six times 4s.—what a difference this is! Let us keep them out at all risks.' We have had instances of sawyers leaving their work and paying men to work for them, whilst they came and got relief. Within these few days we found out the case of a cabinet-maker named Baylis, working for a Mr. Edwards, in Lambeth-walk, and at the same time receiving 6s. 6d. per week from us, under a pretence that he was out of work. In fact, such discoveries are perpetual."—*London Report.*

IMMORTALITY.

(In answer to a Correspondent—continued from our last.)

LAST week we demonstrated this undeniable fact, that the human mind is less finite and less mortal than that of any other animal. It embraces the past, the present, and the future in time, and it extends its wings to the infinities of space: it is thus a little type or model of the universal mind. Every thing in Nature may be called an image of deity in some one or more respects; it lives, or moves, or rests; it is hard or soft, bitter or sweet, cold or hot, all of which are individual attributes of universal nature. But of the human mind alone can it be affirmed that it can look back and forward into eternity, and encompass the whole circumference of infinity, if we may be allowed the use of such an absurd expression.

Nature having thus formed man so very differently from all other organised beings, it certainly seems very probable at least that his destiny is different; and when we consider that she has implanted within him a universal belief (for the exceptions are not worth speaking of, any more than suicides are worthy of being regarded as a refutation of the universal love of life), that his conscious being is indefinitely prolonged throughout successive changes of existence, we arrive at a moral certainty that that universal hope of mankind will be literally realized. It is a universal law of Nature that every animal anticipates the end or purpose of its being; they build their nests or their huts, they lay in their winter stores, and make provision for all future contingencies, according to the prophetic inspiration of instinct with which each species is individually endowed; it is an impulse which belongs to the species, which is not given by experience or by reflection; it acts like the breathing of the lungs or the circulation of the blood—they must obey it; it is an unerring impulse, which always leads the species aright, although in many cases the individual may commit extravagant blunders in blindly following it. Pursue this physiological law into the intellectual constitution of the great image of the Devil and God upon earth—man progressing from the lowest state of intellect and morals up to the highest conceivable pinnacle of individual perfection, and you find that, in conformity with this universal rule of action, man has invariably provided for or anticipated a more extended career of individual being than that which is comprised within the narrow limits of what we call the present life. If this be a delusion, it is an exception to the universal practice of Nature, for it is not individual or partial. Were it sectarian, or confined to the breasts of a minority, which had never influenced the public morals or political movements of society, the force of the argument might be considerably weakened; but we believe that no nation ever existed, or can exist, in which this sublime and characteristic hope of humanity is not experienced, with the exception of a dissentient minority.

But then, it may be asked, why should not this mino-

rity be in the right as well as another? We answer, the minority are not altogether wrong; they are necessary as a corrective of the absurdity and abuse of the original faith, which, like all the other productions of Nature, is first rude, unpolished, and hideous in its aspect, but is at last refined by the fire of criticism, through which it is made to pass by means of a negative doctrine. The old opinions of the world respecting Heaven and Hell, as two separate localities, are monstrous in the extreme, and many just and liberal minds, not knowing any other mode of interpreting the hopes and fears of mankind respecting futurity, have, according to the universal practice in all similar cases of opposition and apostasy, made choice of a decided negative in preference to the popular creed of the species. This is a wise provision of Nature, to force discussion, and draw the ignorant, and mere instinctive credulous mind out of the first state of unenlightened faith, or superstition, into a rational system of philosophical and universal faith. The two parties are pretty fairly balanced in respect to truth; for the one has the original basis of individual immortality, which is perfectly necessary to make Nature consistent with herself, and maintain the harmony and inviolability of her laws; and the other has the principle of eternal justice, in rejecting the horrid doctrine of an extreme distinction of parties in respect to the happiness and misery of both in another life. They are perfectly reconcilable; thus, the believer is *right* in saying there is a heaven and a hell; because virtue and wisdom will always be rewarded with pleasant sensations, and vice and folly be eternally punished with unpleasant sensations. For as man is a finite being, and finity involves the necessity of ignorance, and ignorance of folly, and folly of vice, it follows, that into whatever state of being man immingles, he must to eternity be guilty of a greater or less degree of evil, and suffer accordingly; and produce a certain amount of good, and enjoy its proportionate reward. Heaven and hell are within him; they are both omnipresent and eternal. The infidel is *right* in denying the existence of heaven and hell as separate localities, where one party enjoys excess of pleasure without pain (a contradiction and an absurdity), and the other an excess of pain without pleasure, which is a genuine *diabolism*. Our doctrine thus demonstrates the truth of both parties, each having one-half of the truth only; by which rending or separation of its component parts, they have each brought forth a doctrine, which, as a whole, is contrary, in its literal sense, to the fundamental laws of Nature, and appalling to the feelings of the species.

Moreover, it may be urged against this view of the subject, that, as we have already demonstrated, Nature herself is a deceiver, and God, according to every species of revelation, acts the same equivocal and delusive part. What faith, then, it may be asked, can be reposed in a being who thus sports with the confidence of his creatures, and leads them astray by false and hypocritical promises? May not the negative be as true as the positive? If it can be demonstrated that annihilation is a greater good than immortality, then we admit the very great probability of the truth of the former, for Nature, or God, has never yet deceived mankind, either in science or revelation, without conferring a greater good by the deception than could have been realized by the expected boon. It has only been in partial promises and exclusive illiberal expectations, that man has been deceived. When he expected party supremacy, deliverance to himself, his seed, or his nation, in preference to all others, he has invariably found the promise illusory; but the deception has only given a more general and universal character to

the promise at last, which so far from being falsified, has only progressed, from a limited and exclusive application to one which embraces the whole human species. The ultimatum of the progress of Nature must be good; its perfection, its harmony, its almighty power, are at variance with any other supposition. Final evil can only be the result of disorganization, discord, and chaos, none of which are observable in universal Nature; the only specimens of such incongruities are confined to small and subordinate sections of the great whole. Hence we conclude that the final destiny of the human species is good; and the promises of Nature can never be falsified by a fulfilment which is not in full accordance with the most exalted hopes and generous feelings of humanity.

(To be continued.)

NESTLINGS.—It is a curious provision made by nature that the dung of all nestlings is enclosed in a thin membrane, which enables the old birds to carry it away in their bills, which they do regularly each time they bring food to the nest. The young instinctively, even before they can see, protrude their hinder quarters to eject the dung from the nest; but if the parent did not carry it away, there would be a congeries of dirt under the nest, which would not only be uncleanly, but would attract attention, and discover their retreat. As long as young birds are kept to their nests, in a basket or box, the membranous covering continues; if they are let out to perch it ceases; if they are shut up again in the nest or basket it reappears. The warmth and quiescence of the nest certainly occasion it, and principally the quiescence; but how it should have that effect we cannot pretend to understand. It is a marvellous provision of almighty wisdom.—*Field Naturalists' Magazine.*

In the memoirs of Dr. Holyoke, who died at the age of one hundred, at New Jersey, in 1829, it is stated that for several years his vision was so disordered that everything appeared four or five-fold; when he looked at the moon, he saw five moons. Mr. Prevost, the celebrated professor of Geneva, is similarly annoyed in reading; the letter o appears like 8.

ZINC MILK-PAILS.—Among the patents lately taken out in America, one is for a process for extracting cream from milk by the use of zinc. It is said that if zinc be put into the milk pail, or the milk be put into a vessel made of that substance, the same quantity of milk will yield a greater proportion of cream, or butter.—*Repository of Inventions.*

It would require more patience than a dog is possessed of, to bear with some people, and we don't pretend to be equal to dogs either in patience or faith. There is a set of tempers in the world which must have every thing their own way, and who are utterly destitute of the spirit of conciliation. Victory, victory, is what they want, and no compromise. We have a specimen of this occasionally at our lectures, where two or three individuals are determined to have it acknowledged that there is nothing but matter in existence. We told them that we had no objections to have it so, provided they allowed that matter was spiritual and intellectual. But, no, no; they have a sort of nervous horror at the word spirit. No spirit, no mind; mind is nothing, it is only an effect. Matter kills mind, but mind cannot kill matter; therefore mind is mortal, and matter immortal; and yet mind is nothing at all! They talk of the properties of matter, and when you ask them what the properties of matter are, they reply, "*Matter.*" The properties of matter are matter itself. Consequently matter has no properties at all. But they do not see this inference; their logic can-

not go beyond tangibility and visibility. Reason is of no use, for it deals with abstract terms; it works with the imagination—a bump which ought to be scooped out of the head of every child as soon as it enters into this arena of intellectual strife. With such people there can be no termination to controversy; but there must be a termination to patience. If they are not satisfied with our doctrine and replies, the metropolis is before them to choose better; but if they want to convert us and our hearers, we advise them by all means to come prepared with definitions of the words which they employ. One man calls life, *Motion*. When asked what is the difference between a dead man and a living, he replies, "*None at all*": they are only placed in different circumstances." This is the doctrine of individual immortality, which he denies.

TO OUR READERS.

We shall complete the *Shepherd* at its first anniversary in August; when we shall give a copious index of all the matter contained in it. It will then make one neat volume,—the prophetic messenger of a new era in the history of man, and the fundamental base of a system of doctrine, which will yet harmonize all religious and political sects in one.

CORRESPONDENTS.

H. M. C. is mistaken in supposing us to be Astrologers.

We have only expressed our admiration of the principles of the science; and moreover we are of opinion that nine-tenths of those who practise it as an art, know little or nothing about it. To cast a nativity is one good day's labour, and we are not willing to spend so much time in enquiring into the future destiny of any of our readers, even supposing we were able: it puzzles us sadly to discover our own. We don't value astrology as a bo-peep into futurity, but merely as an evidence of the general harmony of the universe. There is evidently some perceptible correspondence between the celestial and terrestrial movements; but we do not think that the finite mind of man can dive so deeply into the infinite mystery as to specify particular times and minute circumstances. The aspects, when very striking, will verify a prediction; but in general the aspects are not striking, and therefore delusive to the utmost degree of human skill, and much more delusive to human ignorance and mercenary indifference. We must humbly confess we cannot rule the planets.

G. H.'s Address closes very prettily; but the first half is laboured, and the first line is unintelligible. It is much inferior to his last as a whole.

Mr. Bankhead's rambling and rhyming genius is very funny, and pretty smart upon some folks; but there are one or two words which render the poem "unprintable."

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 20th inst., at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Bready, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 35.]

SATURDAY, APRIL 25.

[Price 1d.]

SYSTEM OF NATURE.

UNIVERSAL being, or existence, naturally divides itself into two aspects, which we call matter and mind; the one gross, the other refined. We call that matter which can be seen, or felt, or measured, or weighed; and we call that mind which acts by will and intelligence; yet we cannot draw a line of distinction between them, any more than we can distinguish bitter from sweet, or cold from heat. It is evidently a law of Nature that the two extremes run imperceptibly into each other. We see the great type of this in the outer or external manifestation of the universe; namely, the material world, which divides itself into three kingdoms. The mineral kingdom is the representative of matter, the animal kingdom of mind, and the vegetable kingdom is a medium between. All these three kingdoms run imperceptibly into each other, so that the line of distinction escapes the scrutinizing eye of the naturalist; but we do not hesitate to speak of minerals, vegetables, and animals, as three distinct modes of existence. So also mind and matter are essentially distinct in their extremes, although indistinguishable at the line of separation.

In the vulgar sense of the word, *Nature* is the material or gross portion of existence, and *God* the mental or refined portion; although, properly speaking, we cannot draw a line of distinction between them; but accommodating our language to the language of the society in which we live, we say that the more refined, intelligent, and moral a human being is, the more godly or divine he ought to be accounted. Grossness of mind, ignorance, sensuality, brutality, and all the kindred vices of the first stage of human being, belong to what is vulgarly denominated Nature, or the Devil, who is the beginning of the progress of humanity, from which we ascend upward to comparative perfection.

Society has always been progressing in this direct line from matter to mind, however retrograde it may seem to have sometimes moved. The good has always been more or less prevalent over the evil. In fact, we consider it an impossibility for evil to increase collectively, and triumph over good; for no state of society can be good, if it cannot defend itself against an enemy that is worse than itself. If we examine the peculiarities of ancient and gothic, or barbarian patriotism, we shall find that we even made a considerable step in advance, by the inroads of barbarous nations upon the Roman empire. The ancient patriotism was directed to the city or country alone; but the metropolis especially was the object of its adoration. Athens, and Rome, and Sparta, were all

deified by their respective citizens; and the king, general, nay, even the people themselves, were all accounted of no estimation in comparison of the personified idol of the Grecian and Roman citizen. The gothic invaders of the Roman empire, however, had no such local prejudices to limit the sphere of their attachments; notwithstanding, they were equally exclusive. They deified their leaders, their tribes, families, and clans, in the service of whom they considered themselves justified in committing the most barbarous crimes. This however was a step in advance; a step from death to life; from local allegiance to personal allegiance; from the mere physical union of native and country, to the more social union of the individual and his tribe. From this new idea have arisen all modern notions of honour, which first gave birth to the age of chivalry and romance, afterwards developed themselves in the external courtesies of life, and are now floating in the minds of the whole mass of the people, preparing to manifest themselves in a more impartial manner upon the principle of universal equality of privileges. The feudal spirit of allegiance to individuals, such as kings and parties, still possesses the minds of the privileged orders, for to them belong all the honour and advantages derived from the system; but the people at large are now fast divesting themselves of these partial views of moral and political duty, and treating with equal contempt and aversion the ancient system of allegiance to cities and countries, and the feudal system of allegiance to individuals and tribes; they are taking the third and last step of the progress of human society, into *political universalism*, or allegiance to the species.

It is to be supposed that during the various stages through which the human mind has been progressing in the lapse of ages, that the laws of private morals must have assumed very different aspects, although the principle, and even the "wording," of the law, was always the same. The moral law is founded upon the rights of men. When all rights and privileges were vested in a king, every species of obedience became due to him. When the land was accounted his by a right divine, a simple decree of majesty, or a verbal commission, would justify any man to whom that commission was given in dispossessing any individual of the patrimony of his fathers, and taking violent possession of the finest estates, which had been enjoyed for ages by a lineal succession of many generations. This species of injustice was frequent of old, and the conscience of the aggressor was appeased by a conviction of its legality. He was only taking possession of his own property, transferred to him by an act of right divine. We call it injustice; but there

was no more injustice in such an act, than in that of a British landlord dismissing an obnoxious tenant from a farm, and placing another in his stead. In future ages the latter act will be quoted as an instance of violence and tyranny side by side with the former, and probably the question may be discussed in the debating societies of our posterity, "whether the assumed rights and privileges of civilized landholders, or of barbarian chiefs, were the greatest aggravation of tyranny and injustice."

In ancient times, amongst the eastern nations, it was not accounted felony to go into an orchard, or a field of corn, and there satisfy the cravings of nature. Moses permitted a man to eat his fill in this way, but forbade him to carry any of the produce away. Our ideas of felony are very different in these refined and civilized times in which we live; the laws of modern morality make no allowance for the cravings of hunger, or the longings of human appetite. Hence it appears that many who are accounted thieves and felons in modern times, might have been accounted very moderate, honest men of old. Still the commandment holds good "Thou shalt not steal;" but the meaning of the word "steal" is arbitrary, and depends entirely on the spirit of the age and the laws of the country. Shooting game is a very criminal species of theft in our country; but if the game laws were repealed, it would be perfectly innocent. The crime is artificial: the law has invented the *immorality*.

The peculiar characteristic of the old world is that of individual appropriation; and it must come to its height before it be destroyed. Every thing must be appropriated, all public property must be individualized, and the monster of selfishness be glutted before he be slain. This is well nigh done already; but the excess of the evil destroys itself, a reaction immediately takes place, and the idea of public propriety, once suggested and impressed upon the mind by an observation of the mischief resulting from private appropriation, will grow with a sure growth till it ultimately establishes itself as a political and moral axiom; then morality will change its character thoroughly, and still the original base or principle will be the same for ever. That which is common cannot be stolen or trespassed upon as at present. Wanton destruction of the produce of the soil must always be a trespass upon the rights of society; but to tread on the green sward, to fish in the brook, and to regale one's-self with the luxuries of rural nature; these, which are now offences against the rights of individuals, will one day be free to the whole population, as they now are amongst nations where property is unknown.

The spirit of covetousness is a selfish spirit, which leads man not merely to desire the property of another, but collect property of his own; it is the universal spirit of the old world; it is by this spirit that we individualize ourselves and our families, separate our interests from the interests of other men, and contend with each other for every species of property, gewgaws included. The tenth commandment prohibits this, and in doing so it condemns the system of private accumulation. We know that the Jews and the Christians, vulgarly so called, will torture and twist this simple precept into another meaning, as they have tortured every other precept and maxim of mo-

rality. But the spirit of the law of God, or Nature refined, decidedly condemns this feeling, by identifying the principle of covetousness with private accumulation, and then excluding the covetous man as an idolator from the kingdom of heaven. There can be no such covetousness in a refined state of socialism, which is the *beau ideal* of universal and individual morality.

Marriage is a species of individual appropriation, which is of a peculiar nature. Man and woman are one being, the two extremes of one divided system. They are members of each other; but it cannot be said of any individual man and woman that they are in a particular manner the two extremes of one individual body. This can only be affirmed of the two sexes in general. To determine the relationship that exists between two of opposite sexes, we have only to consult the individual affinities, or the affection of the parties. What God hath joined together, let not man put asunder; and, as we have already observed, the true characteristic sense of the word God is the moral or mental department of Nature, as contradistinguished from mere material, vulgarly called physical power. The union of the sexes, therefore, in a refined state of society, will be determined by affection solely, and not be forced, in opposition to affection, by the exercise of a magisterial power. Formal marriages are the marriages of man; love is the marriage of God—"What then God hath joined, let not man put asunder." Some imagine that this is licentiousness. It is the very opposite: love destroys licentiousness. The present system is gross in the extreme; it is a nursery of every sensual and beastly propensity of human nature; the bane of domestic happiness; a female slave-trade; a system which separates the affections of individuals by pretending to bind them for ever, and thus renders it almost a miracle to witness an instance of real sexual attachment. Pure love, moreover, is not a rover, as some imagine. It is an individualist; it seeks its object, and abides by its object as long as you let it alone; but once attempt to enchain it by any means, however legal—(it despises law)—and it becomes a rebel and a rover in spite of coercion. Marriage must be cemented by the chain of materialism, or political law, as long as man is in a rude and unpolished state. To attempt to alter the present system of marriage, before society was constructed upon the principles of universalism, would be extremely wrong. What we say, therefore, upon the subject, is purely prospective—a glimpse of that stage of refinement to which the seventh commandment will one day arrive, when it will not be accounted a moral crime for one man to take the wife of another, with her own consent; for the two parties are then united by God himself. In such a state we have no doubt that all our women will be chaste, and our men honourable; fidelity will be universal, for love will be free; and it is only *freemen* who can be honest.

The sixth commandment, against murder, ought not to be confined to the mere letter of the word "kill;" it has also a more refined and moral sense. We may kill a man's character, as well as his body; we may murder his peace of mind; we may even be the means of driving a man to despair, and to suicide itself, by our ungenerous and unfeeling treatment; and yet be innocent in the eye

of the law. But that conduct which comes under the cognizance of the law of legislators, is not, properly speaking, moral conduct in the refined sense of the word. The true moral law is the refinement of the letter of the commandment; the hidden or spiritual meaning; that which the eye does not perceive in the word, but which the mind discovers by inference and reflection. The mere commandment, "Thou shalt not kill," in the literal sense, is an insult to a refined mind, and perfectly unnecessary, except to brutes, and their human prototypes. But the interpretation which Christ put upon it is of a much more beautiful and polished character. "Ye have heard it said by them of old times, Thou shalt not kill; and whosoever shall kill shall be in danger of the judgment. But I say unto you, that whosoever is angry with his brother without a cause, shall be in danger of the judgment; and whosoever shall say unto his brother, Thou fool, shall be in danger of hell fire." This interpretation is the true "moral law"; the other is merely the law of the magistrate, which is of force in a rude state of nature, and is a kind of schoolmaster to bring us to the pure spiritual commandment; the very essence of social love and good manners, "thou shalt love thy neighbour as thyself."

The ten Jewish commandments are the basis of morality; but they have hitherto been grossly and carnally considered. The spirit of the commandment has always been overlooked. The spirit of almost any one of the ten might restore the whole of society to tranquillity. The spirit of the first and second, the ninth and tenth, is pure universalism in faith and practice; and all the rest lend their subsidiary aid to establish the liberal, the social, and the eternal principles of good moral nature, which we advocate.

THE SHEPHERD.

ON MENTAL DISEASES.

LETTER IV.

"Some for ambition sell themselves;
By avarice some are driven;
Pride, envy, hatred, best will move
Some souls; and some for only love,
Renounce their hopes of heaven.

"Yes, of all human follies, love,
Methinks, hath served me best;
The apple had done little for me,
If Eve had not done the rest."

SATAN, in *Southey's* "All for Love."

Ich bin des trocknen tons nun satt
Muss wieder recht den Teufel spielen.—*Goethe*.

I am quite tired with the stupid trash:
I must begin anew a merry tune.

Well, then, my gentle readers, though not a young amorist, I must begin again that subject, which has given so much encouragement to the tragic, lyric, and elegiac muse, and has become, like the standing armies of modern Europe, the standing topic of newsmongers and novel writers. Yes, it is the naughty, blind, winged, pretty little archer; it is the wicked son of Cythera, who inspires the Alpine Philosopher, and bids him to write another chapter on love.

It is midnight; a lamp casts its glimmering light over

my papers; nothing interrupts the romantic ebb of my feelings, 'except now and then the shrill noise of some obstinate spiritualists, who, in spite of the Temperance Society, are, as it were, in intoxication!

It is midnight, I say; and this hour is the most befitting for one who writes on madness and love.

As I have observed in my former letters, most of the mental derangements, particularly among the fair sex, owe their origin to love.

This passion, when opposed or abused, degenerates into melancholy. In some cases this disease, if concealed and violently repressed, or unkindly treated, is one of the most obvious causes of suicide. Yet the number of suicides is small in comparison with the number of mental derangements.

Melancholy, however, if not properly treated, turns into two more dangerous stages of mental disorder, namely, apathy and mania.

The first disorder can be easily cured; the two others, however, are often of long duration, and present the greatest difficulty to the medical philosopher.

When melancholy has changed into apathy, the nervous system falls into a state of torpor and debility, the digestion is impaired, the perceptive faculties are depressed, the power of imagination is dead. In this case it is difficult, if not impossible, to awaken sympathy in the sufferer, and to employ mere mental remedies. The magnetic treatment, with or without battery, must be employed, together with the moderate use of tonics; but these must never be employed without having previously removed all sorts of constipations. In this case, some physicians are so imprudent as to make use of large doses of mercury. I disagree with them altogether. Neither do I approve of the use of mercury, nor of the large doses which they prescribe to the insane. Mercury has the tendency of weakening the cerebral system; and large doses of any cathartic render costiveness perpetual. Gentle vegetable aperients, in small and repeated doses, is all which is required. But the generality of the professional men are like the modern tacticians; they have but one method, that of turning whole masses upon their enemy.

Even in medicine, the best method is to risk as little as possible. Fabius and Sydenham are the patterns for the general and the physician. It is said that a good painter can change, with a stroke of his brush, the laughing into the crying attitude; so much similarity and affinity is between the two. The same affinity exists between the soldier and the doctor.

The most suitable mode of administering tonics is in combination with some aromatics; the cinchona with valerian, or the compound tincture of iron, are very useful. But there is no remedy absolutely specific. Each individual demands in each disease a particular drug, and a particular form of administering.

In cases of mental derangement the greatest care must be taken to induce the patient to submit willingly to his adviser. The insane must be treated like children; they must be coaxed, not kicked, into obedience.

When melancholy turns into mania, the nerves are generally in a state of over-excitement, and the conges-

tion of blood towards the head causes often the most excruciating pains, which drive the patient to fits of rage. This change occurs most frequently where jealousy, or insulted pride, are the causes of derangement. Here, love turns now into a kind of hatred and despair; now into fits of ardent desire, now into total prostration of mental or physical energy. In this case the greatest aim of the medical art is to soften the irritability. Shall we in this case open the veins; bleed profusely, and repeatedly? Or shall we administer drastics? Or shall we treat this case like canine madness, with large doses of mercury and opium? All these remedies are hurtful and useless. Nature has pointed out the way for the cure of this disorder.

Those afflicted with this kind of mania have a natural dislike for food. Absolute dieting, large quantities of water, gentle aperients mixed with the drink, particularly small doses of tartar of antimony thrown into their drink, is the only treatment which they require. If otherwise the patient is well and kindly treated, not harassed by the people who surround him, the greatest irritation can be subdued. In some cases it is advisable to confine the patients in large rooms, with as little light as possible, and to line the walls and floors with mattresses; here they may rave and jump at pleasure.

When the irritation is over, the most minute doses of hemlock, henbane, morphia, or belladonna, will be of great service.

Once I was called to see a lady whose husband had the impudence to bring his mistress under her roof, and to obliged the wife to serve her as her handmaid. This treatment had broken her heart so much that she fell into a state of melancholy. Her brutal husband and his favourite, instead of being moved to compassion, ill-treated her more and more; the ill-used wife in a fit of despair left the fatal abode, and took refuge with her parents. Here I found her in a state of mania; now plaiting straw instead of flowers in her head, singing the the most romantic airs, now laughing and jumping about, now throwing herself raving upon the floor. She was but twenty-five years old, a rather good-looking, amiable, well-educated lady, the only daughter of a wealthy and polished citizen; her husband was a beggarly offspring of ancient aristocracy. The demon of avarice had induced Count T—— to pay his addresses to this rich heiress. "O, save my poor only child," said the mother, when I entered; "save her, or kill me together with her."—"I will try to save her, but I must have the permission to do whatsoever I shall think proper."—"Do all that you like, and save her," replied the mother." At the same moment the daughter fancied that her mother was her rival, who was talking with her husband, and she sank upon her knees, and began to intreat her, with the most pathetic tone, to leave her husband alone: "I shall inherit some thousand pounds, I will give them all to you; but leave my husband; he is mine; I am his lawful wife, he is the father of my children." In the next moment she rose furiously from the floor, threw herself raving upon the sofa, and cried aloud, "Murder! murder!" I ordered an apartment of the large house to be prepared, lined with straw mattresses; the windows half

blocked up; lemonade, water, and ices, were the only drinks to be administered to her. In the water I ordered half a grain of antimony to be put. As soon as the room was ready, she was taken there during the night. I visited her three or four times a-day; her parents assumed the attendance upon her during my absence. In a few days the irritation had subsided. I began then to act spiritually upon her mind, and to treat her internally with small doses of henbane. Her food was thin broth, and boiled fruit. No flesh, no fowl, no fish, was offered to her. From this room she was removed into a garden-house, from which she could walk into the lawn and flower-gardens. The change was highly gratifying to her feelings. Her mind began to open to the impressions of the beauties of nature, and nature restored her disordered mental faculties to their primitive harmony. The kindness of her parents, the feelings of gratitude for their cares, the care for the education of her own children, banished the heavy clouds which darkened her understanding.

In a similar way most of the mental disorders caused by love could be removed.

I hope the time will come when these papers shall fall into the hands of some philanthropist: "Much has been done and said," will he exclaim, "for the improvement of prison discipline; shall nothing be done to improve the treatment of the most wretched of human beings?"

THE ALPINE PHILOSOPHER.

INGRATITUDE AND IMBECILITY OF TYRANTS.

THE following description of the condition of the royal troops on the Wednesday evening of the memorable three days' Revolution of Paris, is worthy of being preserved in the memory of our readers:—

"The royal troops were no longer in a situation to attack, and it was with difficulty that they could act on the defensive. They were surrounded by an immense population in arms—a population constantly on the alert, indefatigable, fearless, and encouraged on all sides by their friends, who at this period occupied themselves in supplying all their physical necessities. But the case was entirely different with respect to the troops. Their selfish and ungrateful rulers cared not how much they suffered from famine or thirst. Their object had been to provide them with arms, under the disappointed hope that they would be enabled to provide themselves with nourishment. Such was the improvidence of the party of the court, that they had not adopted a single measure necessary in case of a reverse. They had provided neither bread, nor meat, nor wine; a little brandy had been served out to them, and this was all they received. If a few were so fortunate as to obtain any little assistance, it was from the commiseration of those whom they came to massacre. In consequence of this neglect, the greatest confusion reigned throughout the different regiments. Harassed not only by inanition, want of sleep, and all other physical privations, their moral courage also was shaken. They found that neither the king, nor the dauphin, nor any of the leading men of the government, either countenanced them by their presence, or soled them by their aid. They saw themselves deserted by the higher orders, and assailed at all points by the lower. This complete insulation, even in the midst of

society, convinced them that the cause they were defending was that of one man, and that which they were opposing was that of a whole nation. Furthermore, the unexpected resistance, and unlooked-for determination displayed by the citizens, completed their discouragement; every thing about them and around them was either menacing or gloomy; they had heard themselves on all sides accused of supporting the cause of despotism—their consciences told them that the accusation was just. It was not therefore to be wondered at that mutual defiance and recrimination had now begun to break out amongst themselves. Already many of their comrades had seceded, and had refused longer to oppose the cause of the people; others amongst them held on their obedience, as it were, by a thread. Harassed by such reflections, their arms dropping from their tired hands; with the bare stones for a couch, divided between the fear of attack from without, and of treachery from within, the troops betook themselves to such repose as fatigue can sometimes find, even amid the torments of anxiety."

The king himself was enjoying the pleasure of the chase, whilst his troops were murdering his subjects wholesale, because they refused acquiescence in a despotic ordonnance, which declared the liberty of the press to be suppressed, little suspecting that the "*rascally mob*" would evince such determination and scientific discipline.

"The very supposition, that nearly 30,000 of the finest troops in Europe could be beaten by a mob of citizens, hastily collected, and without arms, was scouted as ridiculous; and, although on the very verge of fate, a calm reigned over the palace of St. Cloud: its inhabitants were fully persuaded that the morrow would restore tranquillity to the city, and then for the work of vengeance! The arrest of many eminent men was decreed, and a council of war summoned, to speedily extirpate the political heresy of many of the liberal peers, the editors of the journals, who had so nobly signed their protest against the ordonnances, and those fearless judges, Messrs. De Belleyne and Ganneron, who, from the judicial seat of their respective tribunals, had pronounced their illegality. Musketry and the guillotine were to be the instruments of vengeance; and dreadful would have been the fate of the proscribed, had not the valour of their fellow-citizens rendered the designs of arbitrary power unavailable. Various and conflicting accounts reached the palace on the morning of Thursday. The mingled roar of musketry and artillery was more tremendous than on the preceding day. Nature had not garnished the visible horizon with a cloud; the sun shone with splendid radiance in the blue serene; but over the city, at a low elevation, hung a sulphurous canopy, which appeared like a funeral pall. To the inhabitants of the surrounding heights it must have had the appearance of a volcano, suddenly throwing up its columns of smoke over the edifices it was about to overwhelm. At last arrived the Duke of Ragusa, the master executioner, to whom the work of slaughter had been confided, pale and breathless. Reports had preceded him, and he found all in consternation. The Duke of Angoulême, equally weak in adversity as heedless in prosperity, was reviewing the troops on his arrival; he had more the air of a supplicant for protection than the heir apparent to a crown, in the presence of his soldiery. Not a cry of loyalty to his cause was uttered, to raise his drooping spirits, and the stolidity of consternation pervaded every rank. On his return, he met the Duke of Ragusa, and the following singular scene took place. The marshal recounted his discomfiture, but was rudely interrupted by the Dauphin exclaiming, "You promised to hold out fifteen days, and here you are; you have betrayed us, as you did the city

of Paris before. Do you know to whom you speak?" The disconcerted marshal answered, "To the dauphin." "The king has made me generalissimo of the army," was therejoinder, "and in that quality I declare you to be a traitor." Then turning to a garde du corps, he ordered him to take the marshal's sword. However, snatching it himself, he endeavoured to break it on the pommel of his saddle; the steel resisted, and the dauphin wounded his hand. He thereupon ordered the marshal into arrest. When the king was informed of this rude and absurd conduct, he was much annoyed. Marmont was the only man of military talent who remained attached to the court. However, not to disgrace his son in the eyes of the army, he ordered the marshal's arrest to expire at the end of four hours, and invited him to dine at the royal table. His cover was placed, but the indignant and ill-treated officer did not attend."—*French Revolution in 1830.*

SOCIAL WASPS.

THE wasp is a paper-maker, and a most perfect and intelligent one. While mankind were arriving, by slow degrees, at the art of fabricating this valuable substance, the wasp was making it before their eyes, by very much the same process as that by which human hands now manufacture it, with the best aid of chemistry and machinery. While some nations carved their records on wood, and stone, and brass, and leaden tablets, others, more advanced, wrote with a style on wax, others employed the inner bark of trees, and others the skins of animals rudely prepared,—the wasp was manufacturing a firm and durable paper. Even when the papyrus was rendered more fit, by a process of art, for the transmission of ideas in writing, the wasp was a better artisan than the Egyptians; for the early attempts at paper-making were so rude, that the substance produced was almost useless, from being extremely friable. The paper of the papyrus was formed of the leaves of the plant, dried, pressed, and polished; the wasp alone knew how to reduce vegetable fibres to a pulp, and then unite them by a size or glue, spreading the substance out into a smooth and delicate leaf. This is exactly the process of paper-making. It would seem that the wasp knows, as the modern paper-makers now know, that the fibres of rags, whether linen or cotton, are not the only materials that can be used in the formation of paper; she employs other vegetable matters, converting them into a proper consistency by her assiduous exertions. In some respects she is more skilful even than our paper-makers, for she takes care to retain her fibres of sufficient length, by which she renders her paper as strong as she requires. Many manufacturers of the present day cut their material into small bits, and thus produce a rotten article. One great distinction between good and bad paper is its toughness; and this difference is invariably produced by the fibre of which it is composed being long, and therefore tough; or short, and therefore friable.

The wasp has been labouring at her manufacture of paper, from her first creation, with precisely the same instruments and the same materials; and her success has been unvarying. Her machinery is very simple, and therefore it is never out of order. She learns nothing, and she forgets nothing. Men, from time to time, lose their excellence in particular arts, and they are slow in finding out real improvements. Such improvements are often the effect of accident. Paper is now manufactured very extensively by machinery, in all its stages; and thus, instead of a single sheet being made by hand, a stream of paper is poured out, which would form a roll

large enough to extend round the globe, if such a length were desirable. The inventors of this machinery, Messrs. Fourdrinier, it is said, spent the enormous sum of 40,000*l.* in vain attempts to render the machine capable of determining with precision the width of the roll; and, at last, accomplished their object, at the suggestion of a bystander, by a strap revolving upon an axis, at a cost of three shillings and sixpence. Such is the difference between the workings of human knowledge and experience, and those of animal instinct. We proceed slowly and in the dark—but our course is not bounded by a narrow line, for it seems difficult to say what is the perfection of any art; animals go clearly to a given point—but they can go no further. We may, however, learn something from their perfect knowledge of what is within their range. It is not improbable that if man had attended in an earlier state of society to the labours of wasps, he would have sooner known how to make paper. We are still behind in our arts and sciences, because we have not always been observers. If we had watched the operations of insects, and the structure of animals in general, with more care, we might have been far advanced in the knowledge of many arts which are yet in their infancy, for nature has given us abundance of patterns. We have learned to perfect some instruments of sound by examining the structure of the human ear; and the mechanism of an eye has suggested some valuable improvements in achromatic glasses.—*Insect Architecture.*

NUMBER OF SPECIES OF INSECTS.

Our great and pious naturalist John Ray (the first real naturalist for the animal kingdom—as the equally great Cuvier has styled him), in his *Wisdom of God in the Works of the Creation*, published at the close of the seventeenth century, tells us, respecting the number of British insects,—“The butterflies and beetles are such numerous tribes, that, I believe, in our own native country alone, the species of each kind may amount to 150 or more. The fly kind (if under that name we comprehend all the flying insects, as well such as have four as such as have but two wings, of both which kinds there are many subordinate genera) will be found in multitude of species to equal, if not exceed, both the fore-mentioned kinds. The creeping insects that never come to be winged, though for number they may fall short of the flying or winged, yet are they also very numerous; as by running over the several kinds, I could easily demonstrate. Supposing, then, there be a thousand several sorts of insects in this island and the sea near it, if the same proportion holds between the insects native of England and those of the rest of the world as doth between plants domestic and exotic (that is, as I guess, near decuple), the species of insects in the whole earth (land and water) will amount to 10,000; and I do believe they rather exceed than fall short of this sum.” Subsequently, however, in consequence of having discovered a greater number of English moths and butterflies, he was induced to consider that the total number of British insects might be about 2,000; and those of the whole earth 20,000.

Linnaeus, in the 1761 edition of the *Fauna Suevica*, described 1,700 species of insects, inhabitants of Sweden: and, in the 12th edition of the *Systema Naturæ*, the whole number of these animals (Swedish and exotic) with which he had become acquainted amounted to about 3,000.

Let us now look at the state of the science of entomology in the present day. Mr. Stephens has given us a

Catalogue of named British insects, amounting to 10,000; and, since the time of its publication, numerous additions have been made to the list. It was a curious coincidence, that our poet of nature, Thomson, should have hit upon this very number, in order to give some idea of the vast profusion of summer insects: and Mr. Stephens has happily adopted the lines printed below in italics as his motto:—

“By myriads, forth at once,
Swarming they pour; of all the varied hues
Their beauty-beaming parent can disclose.
Ten thousand forms! ten thousand different tribes
People the blaze.”

Mr. Mac Leay, whose general knowledge of the extent of modern collections cannot be questioned, stated, in the second part of his *Horæ Entomologicæ* (p. 469), published in 1821, that there were certainly more than 100,000 of the annulose animals (nearly synonymous with the Linnean insects) preserved in the various collections.

Messrs. Kirby and Spence, adopting a conjecture of Decandolle, that the number of species of plants may be somewhere between 110,000 and 120,000, observe, that, “as a vast number of phanerogamous plants and fungi are inhabited by several species of insects, we may form some idea how immense must be the number of existing insects; and how beggarly does Ray’s conjecture of 20,000 species, which in his time was reckoned a magnificent idea, appear in comparison!” After instituting a comparison between the numbers of British insects with that of British phanerogamous plants, whereby it appears that, on the average, there are more than six insects to each plant; these authors arrive at the conclusion that, “if we reckon the phanerogamous vegetables of the globe, in round numbers, at 100,000 species, the number of insects would amount to 600,000.” If we say 400,000, we shall, perhaps, not be very wide of the truth.

With respect to the relative proportion of the different orders to each other, Messrs. Kirby and Spence state, that the Coleoptera may be considered as forming at least one to two of our entire insect population. Now, however, that the same attention is bestowed upon the minuter Hymenoptera, Diptera, and Lepidoptera, as has been long given to the small Coleoptera, we find this calculation gives too great a share to the beetles. In Mr. Stephens’s *Catalogue* they barely reach one-third of our native insects. If, therefore, we take the group of predaceous beetles (being the one which has been most recently investigated in the detail of its species with all possible advantages and assiduity by Dejean) we find that, although it did not bear, in the *Systema Naturæ*, a greater proportion to the whole order of beetles than one to sixteen, yet not only in Stephens’s *Catalogue* of the English species, but also in the general *Catalogue* of Dejean, the proportion which it bears to the whole Coleoptera is about one to sixteen. And, as I have already stated that the number of species described by Dejean may be averaged at 2,000, the whole number of beetles, at the above rate, would not exceed 16,000; and, by adding 4,000 more for other known species, the number would not exceed 20,000; and yet Count Mannerheim, in his recent monograph upon the Staphylinidæ, states that Dejean had informed him, in 1830, that he then possessed nearly 18,000 Coleoptera; and the baron himself informed me, two years ago, that he possessed between 20,000 and 21,000 Coleoptera. And by estimating the beetles, as above, at one to three of the insect tribes, we shall only obtain 60,000. What a wide field, therefore, remains to be investigated, before we shall become acquainted with the 600,000 or even 400,000 species sup-

posed by Messrs. Kirby and Spence to exist; and how absurd does it seem to consider our systems, or rather system, as firmly established, whilst so little is comparatively known!—*J. O. Westwood, in Mag. of Nat. Hist.*

IMMORTALITY.

(Concluded from our last.)

THE physiological objections of materialists prove nothing at all, and have nothing to do with the subject. They proceed upon an assumption of knowledge which we do not possess. Their facts are mere nonentities in argument, as both sides of the question employ the same facts in their own defence. Our knowledge of mind and matter is not sufficient to enable us to decide this or any similar question, upon matter-of-fact principles, as some people call them; for matters of fact themselves are the greatest of all riddles, and confounding to the human judgment. We are told that, by compressing the exposed brain, by a gentle pressure of the hand, the consciousness may be instantly destroyed, and restored again after the pressure is removed; and this is sufficient, in the opinion of our matter-of-fact philosophers, to prove that the mind is a nonentity, and merely an effect produced by some chemical action of matter, as they choose to call it. If they were, what they pretend to be, matter-of-fact philosophers, they would have stated another corresponding opposite fact, which completely overthrows their gossamer fabric of infantine logic, namely, that somnambulists, in a state of equal unconsciousness and forgetfulness, perform all those actions which we are in the habit of calling rational, without being sensible when they awake of anything they have performed. This state of unconsciousness is no proof of mental annihilation; it only proves that the correspondence between the mind and the external world is destroyed, or so wonderfully modified as to surpass the comprehension of the waking mind. It moreover proves, what we mean to assert, that there are two lives in every individual; that when the one sleeps the other wakes, and *vice versa*. Hence it is an inference actually founded upon experience and matter of fact, that life is indefinitely prolonged, and other worlds, other scenes, other modes of being, are experienced, after the fleeting shadows of this life are over.

There is no greater excess of presumption and arrogance on the part of man than the attempt to disprove such a sublime and exhilarating doctrine by anatomy and physiology, sciences which are yet so much in their infancy, that even those who make them a professional study have not yet attained to the demonstration and unanimous acknowledgment of their first principles. It is only by analogy that anything can be inferred upon a subject of this nature; and all religion, natural and revealed, pours in a flood of evidence in support of the doctrine of life and immortality. This evidence is, no doubt, given in riddles and mysteries; but these do not overturn the original proposition upon which they are all based. The mysteries are suited to the infantine state of society and the human mind. They are terrific and unreasonable, because men in a rude and uncultivated state are equally unreasonable themselves, and can only be over-ruled by the terrors of the law. But the human mind is not necessarily confined to the letter of these mysteries. They are merely the simple rude outline of an important truth, which will be gradually refined and rationalised as society progresses—but *never destroyed*.

Moreover, no creed, no system of philosophy or of society, which denies this doctrine, or does not acknowledge it as a demonstrable truth, can ever become universal.

Whatever individuals may think of it in private, the affirmative, and not the negative, will always prevail. It is a doctrine in which the species take a particular interest; it is ennobling to their natures; it is cheering to their minds in the prospects of dissolution; it satisfies the aspirations of intellect and imagination, to whose horizon of perfectibility there are no discernible limits; it is consistent with philosophy, with matter of fact, with revelation. There is not a generous and amiable feeling in our nature which does not delight in its anticipation; and there is not a painful desponding influence of the soul which is not roused into action by the supposition of the contrary. In fact, the abstract but comprehensive word *HAPPINESS* is decidedly in its favour, whilst the equally abstract and comprehensive word *MISERY* is in favour of the negative. We do not envy the feelings, nor admire the party-spirit of those who have ranged themselves on the side of gloom and endless night—the devil's battalion to a certainty.

Farther than a mere affirmation we cannot go; we cannot lift the veil of futurity and peep into the mysteries of other modes of being; but we have little doubt that the same universal laws of Nature will prevail for ever, amid all the varied changes of life and being. These laws, however, may be infinitely modified and variegated, so as to produce the very opposite effects to those which are now familiar to us. This is a world of corruption (the devil's kingdom, as every planet and satellite is), and therefore our bodies breed corruption; we are loathsome to ourselves as well as others by nature. This may not always be so; it is merely a type of the present mode of being, and may be entirely reversed where happiness predominates, and society displays universal contentment. This, and similar truths, we may conclude from our knowledge of Nature; but the minute particulars of a state of more refined existence is beyond our discovery, and therefore silence upon the subject is what prudence must always dictate, provided that silence be not construed into denial or indifference, which must always be revolting to the great majority of our species.

With these few general observations, we take leave of this subject for the present.

THE DOCTRINE OF THE "WOMAN."

NO. VII.

THE sexual division of Nature is a doctrine of the utmost importance. The progress of science is always giving more and more development to the splendid truth. The idea of a sexual distinction was confined at first to the animal creation alone, where it required no particular sagacity to discover it. When the study of the vegetable world was elevated into a science, a similar sexual organisation was manifest in plants. Still the limited ideas of confirmed philosophy refused to extend it beyond the sphere of organic nature, until the late discoveries of chemistry have demonstrated the existence of a similar twofold sexual character in the mineral world itself. The same system, therefore, characterizes the three great kingdoms; and thus we are led by analogy, in a resistless manner, to the conclusion that all nature is twofold, male and female.

This is the universal view of the subject, and it ought to be well understood before we descend into particulars respecting the individual. We have already designated the secret acting power of the universe as God, and the external visible manifestation as Nature. The first being male, the second female. The first being the power of Nature, it follows as a necessary consequence, from our doctrine of the harmony of Nature, that the

male of every animal should be the most powerful of the two, as a representative of that power. The second being the *form* of the universe, in which consists its beauty, it follows also upon the same principle of analogy that Woman also should be characterized less by strength and vigour of body, and more by beauty of form and colour. These are two obvious reasons why men and women are so constituted, and mutually distinguished by their respective peculiarities. This is in a more striking manner characteristic of man than of any other animal, inasmuch as he is in a peculiar manner the image of God upon earth.

The peculiarities of those two natures are strength and love, or physical and moral power; the first peculiarly male, the second peculiarly female. The male is first, the beginning of the creation of God, inasmuch as he requires no education to develop his strength. It is brute force. It grows by eating and drinking, and muscular action, and is peculiarly individual and incommunicable; it gathers not by experience or intercourse with others; it begins and ends with the individual himself, the lowest species of animal power. It, however, fortifies itself by means of the inventions of art, and thus creates an artificial strength, which continues to accumulate by the progress of mind. The perfecting of the female nature is more the result of knowledge and delicacy of taste than that of man; it is a more tender plant, more difficult to rear, but more valuable and more powerful when brought to perfection. The strength of woman lies in her mind, her affection, her endearments, and the passive susceptibilities of her nature. These endowments are not appreciated by savages and barbarians, consequently woman is by nature a slave at the outset of her career, and doomed to continue a slave till the moral power by which alone she can gain an elevated status in society becomes a match for the muscular vigour and brute force of man. This comes by degrees: there is no short or royal road to it. She gains ground as science and refinement advance.

But in making this distinction between the two sexes, let no one suppose that we make one or other sex exclusive proprietors of those respective qualities which characterize them, for both natures belong to each; we allude merely to the leading or prevailing character that has distinguished the two sexes in all ages. This remark is necessary to check the captiousness of many, who take less delight in the study of nature and the discovery of truth, than in marring the forms and concealing the beauties of both by the mask of sophistry and the spirit of contradiction.

HYDROGRAPHIC PAPER.—Such are the chemical properties of water that we have no doubt that future generations will be entirely ignorant of the use of ink, except as an historical fact. We shall no longer write with pen and ink, but pen and water. Even now the dawn of the new system has appeared, in a species of paper so prepared by soaking it in a solution of sulphate of iron, then covering it, when dry, with finely-powdered galls. If the blackening takes place immediately, it must be a great improvement upon the present liquid, so destructive to furniture, &c.; but it provides no remedies against blots, which would instantly appear by a drop of pure water falling from the pen, or from the point of one's nose on a frosty morning; not to speak of the tears of the ladies when committing their pathetic sentimentalities to paper.

THE LAMPLIGHTER INSECT.—This astonishing insect is about one inch and a quarter in length, and, what is

wonderful to relate, she carries by her side, just above her waist, two brilliant lamps, which she lights up at pleasure with the solar phosphorus provided by her nature. These little lamps do not flash and glimmer like that of the firefly, but give as steady a light as the gas light, exhibiting two perfect spheres as large as a minute pearl, which afford light enough in the darkest night to enable one to read print by them. On carrying her into a dark closet in the day time, she immediately illuminates her lamps, and instantly extinguishes them on coming again into the light. But language cannot express the beauty and sublimity of these lucid orbs in miniature, with which nature has furnished this queen of the insect kingdom.—*Field Naturalist's Magazine.*

FILTERING MACHINE.—Take a large flower-pot, and put either a piece of sponge or some cleanly washed moss (sphagnum is to be preferred) over the hole at the bottom, fill the pot three-fourths full with a mixture of equal parts of clean sharp sand and charcoal broken into pieces about the size of peas; on this lay a piece of linen or woollen cloth, large enough to hang over the sides of the pot. Pour the water to be filtered into the basin formed by the cloth, and it will come out pure through the sponge at the bottom. The cloth must be frequently taken out and washed, as must the sand and charcoal, and the piece of sponge or moss at the bottom. The larger the pot, the more complete will be the filtration. The charcoal is easily procured by burning a few pieces of wood in a slow fire. This is the cheapest description of filter we know of.—*Gardener's Magazine.*

CORRESPONDENTS.

Disseminator's letter cannot be conveniently answered this week by the Alpine Philosopher, to whom it was addressed.

We have received Mr. M'Diarmid's letter, and Masquerier's pamphlet on a reformed alphabet and universal language. A universal language will ultimately be formed by the progress of the human mind, and any attempt to promote that end must always do some little good. But it is a gigantic work, and can only be accomplished by the co-operation of many generations. Masquerier only analyzes sounds and letters. But the most important of all analysis is that of meanings and roots of words. There is more affinity between different languages than men are aware of. Philology and etymology will yet accomplish this great work. We shall probably make a few more remarks in a future number.

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 27th inst., at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sudbury, Worcester; Brady, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

No. 36.]

SATURDAY, MAY 2, 1835.

[Price 1d.]

SYSTEM OF NATURE.

It is a peculiar feature of the moral law, that it annexes no rewards or punishments to obedience or disobedience. It is not a magisterial law, although the magisterial law has adopted some of its precepts. The moral law merely says, "thou shalt not do it," or "thou shalt do it," and leaves the reward or the punishment to God only. This, like all the other types of old religion, throws light upon the progress of human nature, and its final destiny. It is the emblem of perfection; a *beau ideal* of a state of society in which the knowledge of our duty will be a sufficient stimulus to prompt us to the performance. We do not imagine that such a state of perfection is attainable, for this is supposing a termination to the progress of mind in the pursuit and attainment of knowledge and happiness. But there is a propriety in having this *beau ideal* ever before us, as a compass to direct, and a standard by which to judge of our proficiency; and this standard is to be found in the following words of the prophet, when speaking of the millennium, or kingdom of God: "I will put my law in their hearts, and write it in their inward parts, and they shall teach no more every man his neighbour, and every man his brother, saying, Know the Lord; for all shall know me, from the least unto the greatest." This must be regarded as hyperbolic: true only in a poetical or highly figurative sense; for if it were literally realised, it would put a final stop to all social intercourse, and exchange of individual thoughts and opinions.

Perfect ignorance and perfect knowledge are one and the same thing; only the one is passive, the other active; the one is unconscious, the other conscious. In respect to progress they are equal; for perfect ignorance is incapable of thought, and perfect knowledge has no occasion to think: they are both stationary, and equally incapable of learning or improvement. Man moves between these two extremes: all progress is between them. The same may be said of good and evil, virtue and vice, justice and injustice, or any two extremes of nature. No finite being can ever arrive at either. They exist in the universal mind alone—Devil and God—and never can have an individual or personal development.

The *beau ideal* of society, therefore, is impracticable; and consequently the reduction of the physical or magisterial law to a purely moral or metaphysical law is beyond the limits of possibility for a finite being. There is only an approximation, such as that of the two sides of a hyperbola, for ever approaching nearer to each other, but never meeting. Rewards and punishments are eternal; they are indispensable stimulants to action for all finite

beings possessed of life. We find them of essential use in training all animals; the dog is trained by the whip; the horse by the curb; domestic animals are taught cleanliness and obedience by the same species of discipline. It is of no use to reason with them: the only reason which they can understand is pain and pleasure. This is the logic of the brute; and when we analyze our own logic, or the logic of the most refined intelligence conceivable, we find after all that it is nothing more than pain and pleasure of a more spiritual and intellectual character. What is moral sense, but a sense of right and wrong, in so far as they are productive of pleasure and pain? What is a good judgment, but a power of discriminating between truth and error, harmony and discord, good and evil, or pleasure and pain? Reason, with the rational animal, is the same genus of discipline as reward and punishment with the brute. With the former the impression is made directly on the mind; with the latter, on the body.

But man himself begins life with the character of a brute; his physical powers are developed before his intellectual powers; the gratification of his passions, and the fear of bodily injury, are his ruling motives. With such a being, rewards and punishments are gross and sensual; riches, pomp, and splendour, for the one; stripes, bonds, and imprisonment for the other. In a state of barbarism it must be so; and the mode of discipline can only change with the character of the people. Can the character change on a sudden—can any act of the legislature change it? No; no artificial system can change the people's minds, because it is impossible to make them all suddenly agree upon essential points; and without this agreement every projected system of co-operation or union must come to nothing. Can an act of the legislature make all men Methodists, or St. Simonians, or Owenians? It is impossible. It can only be by the process of public discussion that any principle or set of principles can ever be established; and that process is always a long and a dreary process for the individual, however short it may appear to posterity, who become acquainted with it only through the medium of history. Even education could not be universally bestowed by means of the legislature, for sectarians would not permit it to be universal, and partial education would have very little effect in rationalising the public mind; witness the effect it has upon our college-bred, tutored, and travelled scions of gentility, or literati. Are they more united than the vulgar themselves upon subjects that concern the affairs of the nation? And what better education could we expect the bulk of the people to receive, even if the whole

revenue of the church was devoted to national education? Even when every individual, every chimney-sweep in the country, could write with ease and elegance,—even suppose they could converse with fluency upon abstract metaphysical questions, and general philosophical subjects,—this is no more than many thousands can do, who are now wrangling with each other upon the very elements of knowledge, and treating each other as the demons of ignorance, demoralisation, and irrationality.

As no act of the legislature, no advantages of education, could reconcile mankind, they could not assimilate their moral character. This change is gradual; it is the effect of time, and public reflection. It is always going on; always advancing from the gross to the more refined; but its movement is imperceptible, except by comparing the character of one generation with another. A leap from immorality into morality, by any sudden or artificial process, is as absurd and unnatural as an instantaneous transition from light to darkness without the intervention of twilight.

But, notwithstanding, one thing is evident enough; that it is possible, by general education, and improvement of the external circumstances, to refine the moral sense of the poor to a certain extent. Education always refines the moral feelings, although it does not rationalize the pupil. To be rational, in the extreme sense of the word, is to be infallible, or perfect. This can never be the lot of man; and when we consider the very, very little that any man knows, we cannot hesitate to acknowledge that there is no individual who is entitled to the distinction of rational. Men are rational in degree only, or by comparison with each other. Some are more, and some less, but all are irrational; but he is the most rational who has the most correct and comprehensive views of the principles of universal science, and whose principles are found to be most in accordance with every department of human knowledge or human thought. By general education of the people we prepare the way for these universal principles; for we create a desire for enquiry and a taste for reflection. Ignorant, illiterate men will seldom reason on general principles; and when they do, they do it with timidity, and a slavish reverence to the opinions of others, whom they imagine to be vastly superior to themselves, and endowed with an indefinable sort of gift, with which it would be preposterous in them to contend. They are generally individualists, illiberal, violent, suspicious of trick, imposture, &c., and are almost universally guilty of flying to the very opposite extreme, when once they have abandoned any particular system of doctrine. In this opposite extreme they are frequently greater bigots than before, inasmuch as they now interest themselves more earnestly in the subjects connected with it. It is not until they are humbled, and tired out by long and useless discussion, and reduced to a state of neutrality and indifference, that they can be said to be entitled to the slightest share of the honours of a liberal name. This state of neutrality, however, comes by knowledge and reflection, and is often the fruit of many years' keen contention in those who attain to it; but the greater proportion never do attain to it, but live and die in the spirit of rancour and hostility against all opposing parties.

As long as men are actuated by such feelings, punishments of a gross and corporeal nature are necessary: the law must hold the whip over their heads to keep them in subjection. It is only the fear of death or imprisonment, or some physical evil, that can have any weight with such infuriated partizans. Shame and reproach can have no effect; for they care not for the reproach of an enemy, and a friend would justify them for the commission of any species of crime in behalf of the common cause. The moral sense of the community is divided in opinion; and when this is the case the moral law is unavailing. The law of the magistrate must intervene, and usurp supreme control.

Suppose society divided into two large parties; one party maintained that property is common to all, another denied it. The former party, of course, regards theft as impracticable; the latter regards it as a moral crime. In such a state the moral law is useless, because shame would have no effect on the former party, which would be for ever committing depredations. To preserve peace the magistrate must act, and supplant the moral law by the criminal law.

But suppose the principles of the whole population, upon general morality, to be the same, and their minds refined by knowledge, and their circumstances comfortable, shame and public opinion would then be omnipotent. There would be no party to whom the aggressor could resort for justification and applause, after committing what another party esteemed an injury. There would be one opinion only on the subject, and the force of that opinion would prevent the act, and relieve the magistrate of his duty.

To introduce the moral law, then, we must universalize the public mind, or bring the people to unanimity upon general principles. Till then the magistrate must employ the terrors of the law, and only relax his severity by degrees, as the habits of men improve. But as long as human passions exist there will always be some offences committed. The lowest species of minds, whom Nature has destined to be the scullions of the species, or something worse, and whose existence is indispensable for the performance of certain necessary duties, must always give a little employment to the judge, whose punishments will become more and more moral as the spirit of the age advances.

On the whole, we cannot see an end to magisterial punishments; but we can see a beginning to a moral system, founded upon universal principles, which shall socialize the human race to a much greater extent than now, and be for ever improving, time without end.

Of children we have already expressed our opinion that corporal punishment is necessary for them in youth; to be commenced as soon as they can comprehend its meaning, and gradually abandoned as they become capable of reasoning and moralizing. The same law of progress applies to individuals and the species. That which has been must be for ever. Nature is always the same. We change our laws, not because Nature changes, but because society is getting older and more experienced; but children are always equally inexperienced in every age, and the mode of discipline with them is eternal. There

may be great changes in respect to the subjects taught, and the privacy and publicity of the education; but a rod will to all eternity be the best application to the back of an obstinate young fool; because it is suited to the spirit by which he is actuated.

In conclusion, we add that rewards and punishments are the bipolar law of animal life, by which all its movements are influenced. They can never cease to be employed, both physically and metaphysically; but they will always conform themselves to the spirit of the age, and keep time with the progress of the public mind. But when political and religious universalism is established in any country, the moral law will then have a universal jurisdiction, and the exercise of the magisterial law will from that time gradually be dispensed with. Till that time the number of culprits and crimes must increase. At that time they begin to diminish; and this is all the line of distinction between the old world and the new; the kingdom of the Devil and the kingdom of God. But although crimes are multiplying in the Devil's reign, men are not degenerating. The increase of criminals is no proof of the deterioration of the species; since those criminals are created by the additional restrictions of the laws enacted in defence of covetousness, selfishness, and private monopoly. Crime in the abstract or the aggregate is virtue. It is a necessary check upon the selfish principle; the revenge of Nature upon hoarders of wealth and appropriators of other men's wages. It helps to destroy the evil of monopoly, by scattering the heaps of indolent and unproductive acquisitiveness.

THE SHEPHERD.

TO THE EDITOR OF THE SHEPHERD.

SIR,—Can you afford me a corner in your valuable little paper for a few questions to the "Alpine Philosopher," on the interesting subject of his present letters? I am afraid I am too late this week, however; but, if so, you will perhaps favour me next week.

1st. Does the "Alpine Philosopher" consider the brain as the organ through which the mind manifests itself on earth?

2nd. Does he consider that, in insanity, it is the abstract substance *mind* that is diseased, or its organ?

In his second letter (paragraph 3rd) he calls will and reason the creative faculty; in the 10th paragraph he calls imagination a creative faculty also, or something tantamount to that. Thirdly, then, he will much oblige me by telling me in what respect will and reason is the creative faculty, and in what respect imagination is a creative faculty?

Lastly, Is will a primitive power of the mind, or is it the effect of the action and reaction of circumstances and other primitive faculties on each other?

I make these enquiries in the purest spirit of enquiry, knowledge being the motive; and upon the purport of the "Alpine Philosopher's" reply will probably depend the tenor of some future observations by

DISSEMINATOR.

April 20.

ON MENTAL DISEASES.

LETTER V.

Fungor vice cotis, acutum

Reddere quæ ferrum valet, exors ipsa secundi.

Hor. ars Poetica.

Like unto a whet-stone, which, without cutting, sharpens the pruning-knife.

I RETURN my sincere thanks to *Disseminator*, the first among the readers of the *Shepherd* who has had sufficient frankness to address some important questions concerning the subject of my letters.

In order to encourage the researches after truth, I will answer these questions as plainly and fairly as possible.

According to my physiological and philosophical principles, each individual life presents two aspects, the real or material, and the ideal or immaterial aspect.

These two aspects are the necessary results of the one great principle of nature, the principle of polarity. The ideal or immaterial aspect is the positive, the real or material aspect is the negative pole of individual life. The one is commonly called soul; the other organism, or body.

Each organism has a corresponding soul, or each soul has a corresponding organism. They are both equally necessary and integral constituents of the living being. The plant has a vegetative soul, the animal a sensitive soul, and man a thinking and self-conscious soul; and *vice versâ*.

The human soul, or, what is the same, the human mind, is not an abstract substance, but the one positive and active principle, in opposition to the negative and passive principle, the body or the organism.

This principle is one, but has different forms or modes of action; it is similar to the light, which is one, and yet shows itself in different colours. And who would say that light is an abstract substance?

The mind can also be considered both as the one living principle, or as the totality of the different modes by which it acts or is acted upon.

I said that the soul cannot be conceived without a reality corresponding to its ideality, in the same way that a sculptor cannot be conceived without the marble block in which he embodies his ideas.

The human mind has three distinct primitive forms, to which the three systems of the human body are corresponding—the vegetative, the animal, and the sensitive. Thus the whole body is, correctly speaking, the statue which the spiritual artist has called to individual life from the marble block of matter. But as far as the brain is the centre of the sensitive system, and the sensitive system is the positive pole of the human body, the organs the brain are also the conductors of the different modes of action of the human mind.

I call the organs of the brain conductors of the human mind, because I consider the action of the mind upon the body to be nothing else but the most spiritual form of magnetic agency.

In fact, the brain in *fœtus* is nothing but a bladder filled with water. According as the plastic power of the mind moves magnetically this water, the water assumes

the shape and consistency of brain. Yet the brain itself, with its organs, is, after its full growth, still surrounded with water, in order that the magnetic fluid may act speedily from within and from without, according to the actions and passions of the mind.

The mind as the one positive principle can never be diseased, but it can be diseased in the different forms under which it exercises its activity. Yet since the different individual functions exercised by the mind are exercised through particular corresponding systems or organs, it is clear that the organs themselves are always affected when the particular function to which they are adapted is disturbed.

For the cure of the mental diseases, however, it is of paramount importance to know that there is a continual action and reaction of the mind, and its different functions upon the body and its different organs; that insanity, however, generally proceeds from the mind, be it affected from without or from within; and that insanity in this case must be treated rather morally than medically.

Will is a creative faculty, and indeed also one of the primitive faculties of the mind. The will is the power of self-determination. This power is evinced in the elements in chemical affinities; it becomes more visible in the plants, shows itself in greater perfection in the higher classes of animals, and reaches its summit in the most civilized state of mankind.

The first word that the reasoning being utters is "I will." Certainly this will is finite; it is the inheritance of a finite being; but it is original and primitive, and is, as well as any other faculty in man, capable of greater or less development. It is a creative faculty, because it is the internal spring that moves to good or bad deeds, to rational or irrational undertakings. Circumstances do not create the will; they only offer the opportunities to exercise its action; but the will often creates or destroys circumstances.

Reason is a creative power, because it generates the fundamental principles of science in general. In fact reason is, at the same time, the subject and object of primitive knowledge.

"Disseminator" asks me likewise how imagination is a creative faculty?

Truly whosoever has ever watched the working of this internal magician will be astonished at this question. The artist, the poet, the architect, are they not creators? Hope and fear, pain and pleasure, happiness and misery, are they not, for the most part, the creations of our imagination? And who could or would deny to this faculty the creative power? I certainly would not, who, often immersed in the world of bitter realities, have had no other consolation but to set this power into action, and to create in me and around me the most cheering prospects of human perfectibility and everlasting bliss.

THE ALPINE PHILOSOPHER.

REVELATION.

WE were asked by a gentleman, one Sunday evening, whether it was God or the Devil who inspired the Scriptures? and on our answering "both," he replied, "then

we may presume that there is a mixture of error and truth in them, and consequently they are not to be relied upon." The Scriptures are an image of the universal existence itself. They contain the two extremes, blended in such a way as to appear absurd and contradictory, both to believers and unbelievers. The former, through a slavish fear and false reverence, shut their eyes upon all their defects, for they cannot reconcile them with reason and common sense; and the latter cast off their fear, and give vent to the ebullitions of ignorance and indignation. Were they written like the ordinary productions of men, they would be worth nothing, and contain nothing demonstrative of any superiority of origin; for in order to be like nature, and consequently to be the *word of God*, in a peculiar sense, they ought to be written in such a way as to appear both false and true at one and the same time. They must be both evil and good, cruel and kind, unreasonable and reasonable; and they must develop the evil first and the good afterwards, the false first and the true afterwards.

This double or bipolar character is accomplished by means of types and substances, or the carnal and spiritual sense of the word. When interpreted in the first sense, the word, except the mere historical narrative, is almost all false together. The promises of the Bible are made to a small and obscure people. The blessings of redemption are only to a few, deliverance is promised to Jerusalem alone, and the dominion over all the kingdoms of the earth is declared to be the inheritance of the daughter of Zion only. This is the literal, the partial, or the individual sense of the word. It is the carnal interpretation. No faith is to be put in it. It is an imposition, it comes from the devil; as an apostle says, "the letter killeth, but the Spirit giveth life." So far the Bible is false, because it is *individualized*. But it becomes true by another mode of interpretation, which itself points out; namely, by *universalizing* the word. Thus the book itself says to the Jews "Ye are not my people;" consequently the promises were not made to them; not made to matter, but to *mind*. It is an election of the heart, the head, the affections, and the principles of each individual, which is to be saved; and not an election of individuals, who are all alike dear to God. The wicked are to be eternally destroyed, the good to be eternally preserved, and all men saved. This is the riddle, and very beautiful it is.

But, as our querist replied, *What was the use of a revelation which no one could understand; could we not have done as well without one?*

A revelation was never intended to convey any instruction to mankind, without experience. Experience is the school of wisdom; therefore revelation has taught *nothing* of itself. It depends entirely upon the discoveries of science, and the progress of the human mind, for its development. If God had communicated knowledge to man in this way, he would have irrationalized him, levelled him to the rank of a brute, which receives the knowledge of the art it practises (whether of weaving like a spider, spinning like a worm, or building like a beaver) directly from nature, without the previous process of reason and experience. Man is a rational being

and must find out all these things by dint of mental labour, as he finds food for himself by dint of bodily labour. Revelation, then, as objectors would have it, would be an evil, an insult to a rational nature.

"Then what is the use of a revelation if it teaches nothing? It has done more harm than good." Most assuredly it has done more harm than good; and it will do more good than harm. It has done harm, because it has been individualized; it will do good when it is universalized, for it will lead men to the knowledge of God, and their future destiny. As light pours upon science it pours upon revelation also, and at last the mystery is discovered, and made as palpable to the human understanding as the most matter-of-fact experiments in chemistry. All difficulties are removed; faith and hope are satisfied; and infidelity and liberalism are justified, and contented with a greater amount of evidence for the one, and of liberty and equality for the other, than either party ever anticipated. The wanderings of the human mind are then terminated, their principles are socialized, and they see in this strange book, so beloved on the one hand and so hated on the other, the whole plot clearly though enigmatically drawn out, and the consummation anticipated thousands of years before it was realized. This will afford the most sublime demonstration of the universal providence of God, the only species of evidence for a rational mind, because the only way in which God can be revealed. The revelation or demonstration of God is preparing; it is the consummation of the old world, the threshold of the kingdom of God. It is madness to think of redeeming the world without it; all atheistical attempts will come to nothing.

You see, then, the necessity of revelation being as it is—a mystery. It involves an absurdity to imagine it any other thing, or not to have been given at all; but both believers and unbelievers are equally in the dark on these things. The former say it is not a riddle, which is a lie; and the latter say, because it is a riddle, it is evidently unworthy of God, which is an absurdity.

But although the universal meaning of the word is the only true meaning of value, there was frequently a little truth in the types, merely to keep alive the faith of mankind. Faith would never have been preserved without some such evidence. Hence we find many little fulfillments of prophecies throughout the history of the church, upon which zealots rely as irrefutable evidences of the final truth of their partial opinions; many fulfillments in the Catholic Church, to prove it the man of sin and son of perdition; curious fulfillments in the history of the French wars, to prove Napoleon himself the beast, and France the kingdom of the beast. But the same are found for England and Protestantism, and the same in the human body itself; to prove all men the beast, which is the true and final meaning, or universalism. But until men come to universalism they go through the types of individualism, and finding there curious and striking fulfillments, their faith is preserved, and on they move in firm reliance on the promises; whilst others, seeing these fulfillments defective, or common to both parties, are confounded, reject them both, and become infidels and atheists. Extremes are always wrong.

FATALISM, UNIVERSALISM, &c.

TO THE EDITOR OF THE SHEPHERD.

SIR,—In reading a late work by H. L. Bulwer, Esq., entitled, "France, Social, Literary, and Political," my attention was instinctively fixed on some passages in it, and I was led to draw up a few queries and remarks upon them. Presuming that they may not be inapplicable to the pages of the *Shepherd*; and hoping, moreover, that they may elicit some observations of your own on the subject they refer to, I have ventured to offer them to your notice, together with the extracts which gave rise to them.

Speaking of the French revolution of 1789, Mr. Bulwer says:

"In the history of all nations an invisible hand seems ever mingling with human affairs, and events apparently the most distant and inseparable are linked mysteriously together. Louis XIV. founds an absolute system of order on the same powerful *noblesse*, for whose adherents he is thus obliged to provide. The evil attendant upon a greater good produces in turn its calamity and advantages. The destruction of the great aristocracy burthened the monarch with the vices of the gentry; and the wrath of the people delivered the nation for a time into the hands of the mob.

"The fanatics who traversed the unnatural career of those gloomy times have passed away, and produced nothing in their generation for the immediate benefit of mankind. But Providence, ever watchful for futurity, was even then preparing its events. The terrible philosophers of the *Salut public*, like the husbandman in the fable of Esop, dug for a treasure impossible to find; but as the husbandman, by reason of stirring the mould about his vines, so fertilized the soil as to make it abundant to his successors, so these rash and mistaken philosophers, in quest of impossible advantages, produced ulterior benefits; and while they lost their labour, enriched posterity by the vanity of their search."

The above extract evinces that a faint glimmering of the science of Universalism had entered the mind of the distinguished writer: but he speaks in somewhat of doubt and uncertainty. He says, "An invisible hand seems ever mingling with human affairs." The cautious manner in which he puts forth this important opinion is in some degree to be accounted for when we have read some other passages of his book. He evidently fears the consequences to which the above admission leads, namely, to *fatalism*; for he says, in speaking of the merits of two historical works, written by M. Thiers and M. Mignet, beginning with the former,

"* * * it displays a spirit that would be singularly impartial were it not warped, at times, by a system—false, because it denies the possibility of an accident—horrible, because it breaks down all distinction between crime and virtue, making both the necessity of a position.

"M. Mignet, who has written upon the same epoch as M. Thiers, has been guilty of the same fault. He, too, has seen an infernal fatalism connecting all the horrors, with all the energies, with all the crimes, with all the triumphs of the revolution."

And, in a note to the last sentence, he adds:

"According to this system, all the terrible leaders of that time are concentrated, as it were, into one executioner; all society into one malefactor. Now, Mr. Executioner, strike off the head of your victim; nobody can call you a bad man; you are only doing your duty, the duty which Providence has set you; and it is all for the benefit of the world, and for the advantage of future generations. If the poor creature delivered to you be innocent, be no malefactor, that is no business of yours; law, *i. e.* the law of destiny, has decided that you shall strike: therefore, be quick; and never think there is any reason to be ashamed of your task, though it be a bloody one."

Thus it will be seen that although, at one time, Mr. Bulwer admits that the "invisible hand" is ever mingling with human affairs, at another time he repudiates the idea that that same directing power could possibly have any thing to do in originating the horrors of the Revolution. Like the priests, he in the same breath proclaims that the Providence of God presides over every event, yet that it has nothing to do with the vices, the crimes, the miseries, the littlenesses of man,—attributing all these, we suppose, to chance or accident.

But, Sir, as you have often said, how can anything come to pass in human society, in Nature, by accident? for, if it can be so, then there is no plan, no system, no harmony in Nature, and all is chaos and confusion.

Yet there are numerous individuals who would call an acknowledgment of this plan, this design in Nature, "the doctrine of fatalism," and attach to it consequences of the most terrific import, who would look upon it as a doctrine which at once annuls all idea of moral obligation, and confounds vice with virtue, and virtue with vice; for if a man, say they, believes that all his actions, the most minute as well as the most important, the best as well as the worst, are pre-ordained by imperious necessity, does he not at once deem himself exonerated from blame and undeserving of praise? and will he feel compunction or remorse for having injured his fellow-creatures, or for committing the vilest enormities? Does not, they ask, this doctrine of fatalism give, in fact, the same countenance to bad as to good actions, and render its believers indifferent to the praise or censure of their fellow men?

Now, Sir, these are important considerations; and as universalism (if I understand it aright) is but another name for fatalism, it behoves us to consider seriously the validity of these oft-repeated objections.

It appears to me that the idea of fatalism does not necessarily render inoperative the moral faculty; I mean that approbation of right and justice which seems almost intuitive in man; nor can it prevent a man from acting, or render him indifferent or insensible to the pleasure or the pain which may result from his actions, from feeling pleasure in a consciousness of right action, and regret at the consciousness of wrong action; consequently, although a man may abstractedly believe that all his motives and actions are predestined by fate, and that he is therefore not morally responsible for them; yet he will order his conduct in life, in every respect, as if he was responsible,

and as if it rested with himself what he should will and what he should do. The only philosophic reasons, I imagine, he has for attributing his actions to necessity is, because, in the first place, he is convinced that the precise position in which he finds himself at any given period of his life, is but the effect of antecedent causes, over which he had no possible control; and in the next place, he is at a loss to know how design can be attributed to God, if man can in any way act without the cognizance or the control of God, which he must be capable of doing, if he really possesses perfect freedom of action; and if he does possess this entire freedom of action, the well-being, the improvement, nay, the very existence of human society rests with man alone, and not with God or Nature, an inference which is tantamount to the setting up of man to be independent of his Maker.

May we not, however, conclude that human action possesses, in common with other of Nature's attributes, a bipolar character, and is capable of being separated into two parts—namely, the finite action, which relates to the particular individual; and the infinite, which relates to the species at large? moreover, that a man may be free in actions which refer to his own finite being only; but in those which refer to his infinite connexion with the species, that he may be under the sole direction of God or Nature? It is impossible for us to say what are finite actions, and what are infinite; because, in the abstract, all actions seem to run into infinity; but, as we cannot conceive how God can trouble himself with every insignificant motive and feeling which actuates man in his individual character, so neither can we conceive how such immensely important actions as those which made up the characteristics of the French Revolution could be out of the pale of Nature, or independent of the direction and design of God.

London, 21st April, 1835.

TO THE EDITOR.

SIR,—The pages of the *Shepherd* all real lovers of universal truth and happiness must delight to contemplate. I feel a pleasing satisfaction when my eyes run over each article, and find them treating upon subjects calculated to rouse the sleeping energies of man, and to lead him forth to the fountain of living waters, for he must, of necessity, carry woman along with him. Woman, powerless, but full of power; a slave, yet governing the world; ignorant, but bearing infinite wisdom within her. For what is man but woman's masculine self—woman stronger built? his mother's body his first home, his mother's breast his first nourishment, his mother's care his first preservation, and his mother-mind, or soul, his first thoughts and inward self? Oh man, man, in thy infancy thou art all thy mother's, and thy mother all to thee; and what art thou in manhood, with all thy fancied superiority, but the dupe of woman's ignorance and vanity? But how great, how grand, how godlike thy nature, had woman knowledge how to instruct thee! Cannot a virtuous woman awe thee into silence, and subdue all thy baser passions with a frown? and a cunning woman has made the brave betray his country, and delivered the strong into the hands of his enemy. A woman can set thee free, and make thee blessed; a woman can make thee a slave, and lead thee to destruction. Then where is man's boasted superiority? only in his own imagination; for he is woman's captive even till the spark of life

bounds delighted forth to infinity. If, then, this is the power of woman, and man will be proud to own to himself the feeling Nature has wisely seated there, how necessary it is woman should receive the most extended education, that she may lead the world to freedom, not to ignorance and vice! If man can now be perfecting his redemption whilst there is in existence laws derogatory to man and insulting to woman, whilst we see an ignorant and slavish education forced on the human family, particularly on woman, may we not infer how greatly it would facilitate truth and liberty, did the laws give to woman a superior education, and equal power with the male? It must be obvious to any intelligent individual, the more ignorant the woman, the more artful. The woman best instructed cannot stoop to the meanness of deception; she feels her equality, and spurns to screen herself by a falsehood from an angry husband; and this firmness of character generally marks her children's actions through life.

Turn back the pages of past history, read the biographical sketches of eminent men, and you will find the most prominent characters recorded there are those whose mothers possessed the greatest fund of understanding and love, for these two admirable qualities ever inhabit one breast. Love is the spirit of wisdom, and binds man to man. The fool never loves; passion impels, but love was never known to direct him. He lives for himself alone, and all his acts are for his own gratification. Love is the reverse; it is universal harmony, the delight of life, for which all should desire to exist; not a selfish individual passion, but a virtuous desire, that teaches us to obey the command of God (to love thy neighbour as thyself). Love is the most powerful and good when correctly understood, and directed to the universal good of mankind. A wise woman, in this age of barbarous laws, made in the darker ages, may be justly deemed a phenomenon, and reflects the highest honour on the male part of her family, who, regardless of surrounding prejudices, have given her leisure and liberty to attain these brilliant acquirements, that raise her above her sex; for man is by law made superior, and has a direct influence over the female's person; whilst woman's ruling power comes indirectly, unseen by a common observer. Both among the great and in the lower walks of society, there can be found many female stars: this should teach our rulers that man is in advance of the laws, and prove the necessity of a speedy annihilation of the old code. The waves are continually rolling over; the glittering lamps of heaven ever revolving; man progressing; all nature alive and in motion;—but laws; they alone are immovable and dead: they are immovable; they do not facilitate the liberty and happiness of man; they are dead, as they do not give life to virtue. Has mankind advanced one step by the liberty to marry out of the established church? Are not the arbitrary, derogating laws unaltered? and they are the bane of freedom and universal equality. These abominable laws make woman a deceiver to man, and man a slave to the power of princes. Individual man deserves our gratitude and admiration; but when combined together with the laws, a resolute resistance to their power, and a determination to break to pieces our galling fetters.

P. A. S.

RAPID SKETCH OF THE PRESENT STATE OF ELECTRICITY.

PROFESSOR A. DE LA RIVE has published in four successive numbers of the *Bibliothèque Universelle*, for the year past, an able historical view of the principal discov-

eries made in electricity within the last few years. His memoir concludes with the following *résumé*:—

In terminating this historical sketch, which we have endeavoured to render as complete as possible, it will not, perhaps, be deemed amiss if we present, in a few words, the state in which it leaves the science of electricity.

1st. Two different principles are acknowledged to exist in electricity; the laws of action to which these principles give rise have been determined, both when they are isolated and at rest, and when they are in motion in order to unite. But the nature of them has not yet been determined; nothing has yet been done but to advance hypotheses, which are still unsatisfactory—such especially as that which regards them as very subtle fluids, endowed with certain distinct properties. It is probable that they are rather, both of them, different modifications of the ethereal matter which fills the universe, and whose vibrations constitute light; modifications, the nature of which cannot be known until the most intimate properties of electricity have been more thoroughly studied and ascertained.

2nd. It has been successfully determined that magnetism is only the result of natural electric currents. But what is the disposition of these currents in magnetized bodies? What is the cause which gives rise to them, and what is the reason that a very small number of bodies only is susceptible of the magnetic virtue? These are questions which cannot yet be answered.

3rd. All the sources of electricity are probably at present known; but with respect to the laws which, in each case govern its development, we are still very far from having discovered them.

4th. The influence which bodies may exert over electricity, either when placed in its track, or interposed between it and the points towards which its exterior action is directed, has been within a short time past studied with great care. Many curious phenomenon, in relation to this influence, have been discovered; some laws even have been settled; but the number of anomalies and unexplained effects is still very considerable. It is probable that, in the investigation of this class of facts, means may be found of arriving at some notions with respect to the nature of electricity, and the relations which connect this agent with ponderable matter.

5th. The effects which electricity produces on bodies are now well known; the laws to which they are subject are in general well determined; but their connexion with the cause which produces them rests only on hypotheses, which can boast but very little solidity, and which have lately been very much shaken. It is by an enquiry into this connexion by a study in detail of those effects, that we are to find the means of arriving at a more just idea of the nature of electricity, and of the cause of the effects to which it evidently gives rise, as well as which are perhaps erroneously ascribed to it, and which, such as chemical phenomena, have probably no other relation to it but that of being occasioned by the operation of the same agent.

6th. Finally, after having, from its very origin, framed and demolished theories to account for the action of the Voltaic pile, philosophers are not yet united on that subject; and although at the present time the chemical theory of this admirable apparatus may perhaps be most in vogue, it still requires the support of further observation to be generally adopted, and definitely substituted for the electromotive theory of Volta, the unsatisfactory nature of which is now fairly demonstrated.

This brief recapitulation is sufficient to show that, notwithstanding the importance of the discoveries with

which electricity has been enriched, that which remains to be done in this part of physical science is perhaps more considerable than all that has hitherto been done, since almost all its laws and all its principles are still to be discovered.—*Silliman's Journal*.

INDIAN RUBBER CARPET.—Stretch a piece of canvas on the floor; paste upon it one or two layers of paper, brown paper or newspapers will do; then paste your pattern paper above all, cover it with a thin coat of glue or isinglass, and finally give the whole surface one or two coats of indian-rubber varnish, which, when dried, forms a surface as smooth as glass, through which the colours of the fancy paper appear with great lustre. The carpet is very durable, and impervious to water or grease. When soiled, it may be washed like wood or marble.

FASCINATION OF BIRDS.—A curious instance of this was witnessed by an officer in the Madras army, (Lieut. Colonel Ross, then captain in the 10th native infantry), where the operator was not a snake, as is usual in such cases, but a crocodile, or as we improperly call it in India, an alligator. Colonel Ross, while taking a stroll round the works at Vellore, had his attention attracted by the strange restlessness and apparent distress of a kingfisher bird, perched upon one of the pinnacled battlements of the *fausse-braye*; on his cautiously approaching near enough to ascertain the cause, he observed in the ditch immediately underneath a crocodile, lying perfectly quiet in the water, and intently watching the bird with open jaws. In the mean time the victim's agitation continued to increase; it fluttered down to a projecting point of the works, then rapidly again and again farther and farther down, till at last it actually dropped into the gaping mouth waiting ready to receive it.—*Magazine of Natural History*.

POOR LAW AMENDMENT BILL.—The principle of the Poor Law Amendment Bill is to throw the poor upon their own resources. There could be no objection to this principle, if it were accompanied by a similar principle in respect to the rich. Why not throw the clergy on their own resources, and the fundholders, and the landholders? The poor had as good a right to the rate as the parson to the tithes, the fundholder to the interest, and the landholder to the rent. The principle of the Bill is good enough, if it were extended to all parties; but very cruel when confined to the poor, who have fewer resources than others. It seems as if legislators acted upon the principle of throwing those only on their own resources who had no resources to fly to. We do not wish to see the Bill repealed, but merely the principle of the Bill carried out and universalized, by refusing an idle and sinecure living to every class of the community. It would have been more generous if the legislature had begun the system with the rich instead of the poor; but this was too much justice to expect from them; since, however they have adopted the principle at the bottom of the scale, we hope the public will press hard upon them to carry it to the top, instead of attempting to repeal the act, which would only be leaving us where we were. The extension of the act will redeem the poor; the repeal will be a curse both to poor and rich.

It is reported of three British Bishops, who assisted at the Council of Rimini, A.D. 359, that they were so poor that they had nothing at all—"tam pauperes esse ut nihil haberent."—*Sulpicius Severus Hist. Sac.* Times are now wonderfully changed. A British Bishop is now quit a Dives, and would scorn to suffer one of his reverend predecessors of the fourth century to seat himself at the same

table with his ghostly fathership; and we are infidels, atheists, blasphemers, &c., who propose the primitive simplicity of an ancient apostle and witness of Christ as a model for the pampered protégés of British nobility, who now profess to preach glad tidings to the poor, whilst they spend their whole time in the company of the rich, and fare sumptuously, and dress delicately, upon the wages of spiritual prostitution. What a strange meeting it must be when the spirit of an English Bishop first recognizes in heaven those ancient worthies who fought all the battles of the church in self-denial and poverty, and gloried in the Christian cross, with all the afflictions and privations which the word comprehends! How contemptible the fat spirits must look in comparison with the lean! Consider this, ye that forget God; who feed yourselves, and not the flock.

CORRESPONDENTS.

We have perused so much of W. N.'s Essay, as to see that it was written when the mind had not yet discovered a universal principle, or solvent, by which all general metaphysical doctrines may be analyzed. Along with much sound reasoning there is a good deal of infidelity and scepticism, which is quite unwarrantable. Local and partial infidelity, respecting particular facts or events, is harmless; but any species of universal infidelity which has a tendency to stupify the great movements of Nature, by divesting them of design, harmony, and skilful systematic arrangement for accomplishing beneficial results, is a whirlwind of chaotic thought. There is no system in infidelity or atheism; they are pure negatives. All system must originate in Faith, as the male, perfected and reorganized in the womb of Infidelity; but still Faith, Almighty Faith.

We have got two large manuscripts from individuals, who do not say in express terms they are the Messiah, but we know that they think so. We advise them to trust in God, and he will reveal them to the world in his own good time. If they are ordained to regenerate the earth, a door will be opened for them. The Lord that keepeth Israel, he slumbers not, nor sleeps; his eye is upon them. "He that believeth shall not make haste." And no man can receive their doctrine unless the Lord opens his eyes and his heart to understand and embrace it. Let them wait patiently till the outpouring of the Spirit; for when he comes and convinces us that their doctrine is the most perfect, then we will advocate it immediately; but at present we must confess that the Spirit is driving us before him in a very different direction, and there is no resisting the Spirit, you know. This is an orthodox truth. We always wait for the stirring of the waters, and act solely as the Angel of the Pool directs us. It is useless to rebel.

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 4th inst., at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Bready, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

SYSTEM OF NATURE.

AFTER Moses had received the tables of stone, upon which were written the ten commandments, we are told that he broke them in a fit of indignation at the idolatry of the people during his absence. He afterwards received other two written tables in lieu of the first. The first were the workmanship of God alone; the second were hewn by man, and written by God. The meaning of all this, according to the typical mode of interpreting Scripture, is obvious enough. The moral law must first be broken before it can be kept. It is only in its second stage that due obedience can be rendered to all its requirements.

This is certainly the most simple and effectual mode of discipline. It recommends and establishes the good, by contrasting it with the evil. Evil always wears itself out at last; it commits suicide. It wants that harmony and repose which is necessary to life. We have a very good example of this in war. This was once the glory and the chief study of the human being. All civic honours in former days were attained by means of the sword alone. The ancients esteemed all sorts of merchandize so disgraceful, that they usually committed it to slaves and freedmen. Even learning itself, for a long time, was more cultivated by slaves than by their masters. This was not peculiar to the ancients alone; it is also characteristic of moderns as well. All progress in science and art has been conducted chiefly by the middle and lower classes of society. The nobility have been taught by education, and the foolish pride of rank, to regard every species of productive industry as despicable. Hence it happens that our princes of the blood, our dukes, and our marquises, are either public murderers and plunderers, or nothing at all,—mere idlers, rioting in luxury and extravagance, at the expense of other men's labour and ingenuity. Our great men of rank and fortune are all generals and admirals, men of blood, only because the profession of a warrior has hitherto been esteemed the most honourable of all others. Had it not been so regarded, they would never have borne the name, and gloried in the reputation of a soldier. "Thou shalt not kill," is a commandment which has hitherto had very little effect upon our great models of life and behaviour. They have even gloried in that which is accounted the most revolting deed which a human being can commit, and have studied the art of destruction with such enthusiastic devotion, that they have almost destroyed the military profession merely by bringing it to perfection. The science of destruction has now attained such terrific

excellence, that the world may now rationally indulge the hope of perpetual peace from this circumstance alone. It would be madness to engage with such fearful engines of desolation as human ingenuity can now bring into play. One trial will be quite sufficient to give men a thorough distaste for it for ever. One more general war amongst the civilized nations of Europe would most probably render the life of a soldier so shocking to the feelings of the whole community, that none but the very lowest species of intellects would become aspirants even to the highest honours of the military art. The more destructive the mode of warfare, the better for the world; the sooner men must become disgusted with the inhuman practice. Engines that would sweep down whole battalions, like a thunderbolt, in the twinkling of an eye, would be engines of mercy to mankind at large: they would be the consummation of a system of murder and rapine, which has lasted for thousands of years, and is only to be brought to a close by becoming so terrific that the stoutest nervous system will shudder to engage in it.

Nay, there is another idea more horrible still, which suggests itself, and we are resolved to let it out, right or wrong; namely, that private murder itself is a species of crime which is destined yet to prove a very salutary check upon the tyranny and extortion of the great, and will co-operate with many other crimes of a less heinous and fearful nature, to compel the rulers of the people to relinquish their hold of the purse-strings of society. Murder is not yet brought to perfection. It is difficult to perform the deed without a certainty of detection. If steel is employed, the blood-stain reveals the murderer. If poison, the chemist can detect the agent; and circumstantial evidence brings the criminal to light. It only requires some new discovery, which in all probability may soon be made, by which life can be taken without any symptoms of violence being discernible, to accomplish one of the most curious and interesting revolutions in society which has ever yet been made. It would certainly produce a very extraordinary change, both in public and private morals; a change too, which, even according to the acknowledged principles of the fashionable world, would not be accomplished by unholy means. The system of duelling has always enjoyed the countenance of men of rank and fortune. They defend it upon the plea of its proving a salutary check upon the impertinence of private passion, and contributing by the fear of death to overawe the discourteous and the arrogant into an artificial politeness, which no other mode of discipline could teach them. Upon the same principle we might argue that the facility of taking life without detection, if ever

attained to, which is not improbable, must have an equal effect in lowering the crests of our proud legislative monopolists of power and wealth, and compelling them, by the dread of popular resentment, to establish a more equable system of distributing the produce of human industry and the earth's fertility. If ever the art of murder should be carried to such an extent, (which God forbid!) and prove instrumental in procuring to the people the rights and privileges to which they are entitled as the offspring of a common parent, future generations will probably rank it in the same list with public warfare; and the private assassin and the military hero will shine with equal lustre in the pages of future historians. There can be no doubt that Nature has some great and benevolent ends in view with crimes as well as with arts and sciences. What we have now said with regard to murder, however, is more an amusement of the fancy than a matter of opinion.

The breaking of the eighth commandment has always been accounted one of the meanest and most despicable of all crimes; and so it really is. But there is one particular view of it, which is never taken by moralists, and which ought by no means to be overlooked in generalizing upon the morality of Nature's Providence. Why does Nature stir up the thief to his acts of degradation; why is she guilty of such injustice? is a very natural question, but very few have answered it by questioning or doubting the injustice. It is the justice of Nature which has introduced the art of thieving into society. It is an act of retaliation upon the spirit of covetousness, which is the spirit by which mankind are generally actuated. Man is a selfish monopolist; he is for ever appropriating, for ever accumulating; and his spirit of covetousness more than counterbalances his benevolence and generosity. He keeps around him more than he himself requires. His social spirit is not yet developed. He is averse to distribution. He is for ever committing the most obvious breaches of the tenth commandment, which is evidently directed against individual appropriation, and is characterized by an apostle as the spirit of idolatry, which can never find admittance into the kingdom of heaven. The question, therefore, to be solved in the investigation of this intricate subject, is simply this, "Whether is the crime of private accumulation, or that of private depredation, the greatest?" We know well enough what answer will be given to this question by all the moralists of the old world, who see no evil whatsoever in individual appropriation and accumulation of wealth. But we refer the subject to the jurisdiction of reason and the Scriptures, from both of which we are sure at least to obtain a verdict against the spirit of covetousness, or private accumulation. The Bible even goes so far as to say that a rich man cannot be saved; the meaning of which is, that in the new world there will be such an equality of wealth maintained, that there will be neither rich nor poor; the rich will be spoiled of their monopoly, and the poor will divide the spoil. And reason teaches the very same doctrine; namely, that the spirit of benevolence must be very defective in those who are surrounded with every species of abundance, whilst the mass of society are scarcely fed

and clothed, and a great proportion are literally starved alive with hunger and cold. If these conclusions be just, the inference is obvious enough that Nature is also just, in stirring up a portion of society to commit depredations on the rest; it is merely a reaction, a reaction created by, and not worse than, covetousness itself. The crime of theft will also be carried to perfection as well as the rest. It is necessary for the salvation of society. It is the negative pole of the spirit of accumulation, and must go hand in hand with it for ever. As long as there is such a thing as private property, there must be such an art as the art of abstracting that property from the individual who has appropriated it, and the beau-ideal of a state of perfect honesty is merely a state of perfect community: until we come to the latter, we can never come to the former. But perfect community is unattainable; it is merely a beau-ideal, a standard of perfection, to which we ought to strive; and if so, the art of abstraction, or thieving, must continue for ever, becoming more and more refined in its modes of operation, and farther removed from the rude and barbarous practice of personal assault, highway-robbery, and housebreaking. Stealing is now regarded as one of the fine arts; and is practised by men of all ranks, and all grades of respectability.

From these few general ideas, our readers may collect the meaning of our assertion that the moral law must be broken before it be kept; that it is by the breaking of it that we ultimately discover the true mode of keeping it. All attempts to repress vice by any other means than that of doing public justice to all must prove utterly incompetent. Our vulgar ideas of honesty are absurd; they are the inventions of rich men and monopolists, contrived apparently on purpose to secure their personal property, and justify them in the most outrageous acts of legal robbery. In the eyes of men a rich man never does wrong, he is a respectable member of society; but in the eyes of God he is worse than a thief, inasmuch as he is assisted by legal means in the commission of unjust and ungenerous deeds. Jesus Christ, with the greatest goodwill, and without any conditions, promised salvation to the thief who died along with him; but to the rich man he said, "Go, sell all thou hast, and give to the poor," which he had not the heart to do. Our wealthy Christians seldom think in this style. They consider their rights as divine, and their selfishness and covetousness as perfectly justifiable. We consider them as *moral* theft, theft in spirit; and by the spirit of the law, rich men are the true thieves.

Our readers may finish the argument for themselves. We have now closed our remarks on the subject, and shall commence next week to draw up, in a more connected and systematic form, the whole doctrine of the Science of Nature, or Universalism.

THE SHEPHERD.

STEAM DIGGING MACHINE, &c.—M. Wronski, a celebrated mathematician at Paris, has, according to the Paris papers, discovered a new system of applying steam to carriages, digging machines, hoes, picks, ploughs, &c., so superior, that a French company has bought his patent for four millions of francs (166,666*l.*)

TO THE EDITOR.

SHEPHERD! most like you know, but if you don't,

Will you allow me just to state one fact?

'Tis worth the hearing, so I hope you won't

Accuse me of impertinence:—that act

Would be unkind, and, certes, would affront

One who'd preserve his character compact.

You know I love your pamphlet and ability,

Your rambling genius and its versatility.

The fact which I will state, as I have stated,

And might have told you in as many words,

Supports the theory which you've propagated,

And with the *triune* doctrine well accords:

It seems that science' harp has voiceless waited

For you to touch and tune its mystic chords.

"The dorsal spine (so we're inform'd) contains

"Three tubes which brew all mischief in our brains."

The central tube (or I mistake) conveys

The vital air throughout the nervous system;

And its twin-brothers (such the part each plays)

MOTION and FEELING; nothing can resist 'em!

'Tis strange, the talent and the skill which lays

Nature's arena open, should have miss'd 'em

So long; and 'mid discovery's blazing light,

That they have hitherto escaped the sight!

Air is your *matter*, feeling is your *spirit*;

The "two extremes," a natural antithesis;

The *no plus ultra* of our art, or near it;

Of all our knowledge certainly the pith this is.

'Tis well we are *advanced* enough to hear it:

A sparkling brilliant, worthy you, friend Smith, this is;

And when at length it gains more popularity,

Won't Alpus (1) chuckle for his *bi-polarity*! (2)

Pray, do thou, *envoy extraordinary*,

And *plenipo* from Emperor "Universal,"

Find an analogy to make us merry,

And from our minds the mists of doubt disperse all.

You are such a pleasing, teasing, rattling *Jerry*,

With *Logic* at your side, and can disburse all

Folly's *post obits*; (3) show us, as you wend

Your way, "'twas necessary"—how 'twill end.

We've seen strange doings in this age of wonders,

And heard assertions which might rouse the dead;

Modern discovery, striving with old blunders,

Starts like a giant waking from his bed.

Above the spheres its voice is heard in thunders,

To warn its votaries who have been misled.

We've seen restored the golden age *prophetic*—

Diseases vanquish'd by the power magnetic!

And if the dead some day should take to grinning,

Dancing, gymnastics, or to any other

Vulgar amusement which assists in spinning

The mortal thread of sister, wife, or brother,

Be not surprised. Assuredly we are winning

The clue from out this dark, uncertain pother.

We've got the aid required (this is no flattery)

Of the galvanic—no—*magnetic battery*!

And if we lose an eye it is no matter;

We now can save the tax on window-light.

Let Esculapius chafe, and champ, and chatter;

And couch for cataract—the stone-blind wight!

Our *succedaneum* would conduct or scatter

A troop of devils on a cloudy night:

For Alpus tells, without *ifs* or *buts*,

The seat of vision is within the gats.

I laugh, but 'tis in seriousness; I've wept

Ere now for joy, and smiled for very grief;

As you, perhaps, have done, when sorrow crept

Over the stricken mind; but my belief,

Though in abeyance, shall not all be swept

Away by charlatan or charter'd thief;

But watching, weighing, balancing all solemn,

At last may furnish facts to fill a volume.

Enquiry is the city-gate of truth,

And prejudice is its portcullis; nor excludes

Alone the fresh and nascent powers of youth,

But sage experience, which deliberate broods

Over its mental aliment; in sooth,

'Tis a seductive monster, which intrudes

Its shameless front in every circle; and,

At present, stalks unscathed throughout the land.

I rather would be call'd a silly gull,

A changeling, simpleton, and bear the test

Of irony—be term'd a downright fool,

Than incredulity should ever wrest

The cup of knowledge from me. They who are full

Of wisdom, brimming to the lip, can best

Afford to bid the stream of learning stop;

They must be mad to taste another drop!

But we, who have not quaff'd so deeply, may,

Without presumption, claim the privilege

To give our reasoning faculties full play,

And bend our efforts to the moral siege;

Then, should the sacking of the town repay

Our labour, as we stand upon the bridge

We'll cast our modest banners to the wind,

And leave the cold, conceited few behind.

Then "*audi alteram*;" (4) I felt the shock

(The first in public) of his new machine!

Make the experiment before you mock,

Or brand "*impostor*" on one who 's been

In practice as successful as the stock

Of legal butchers—homicides, I mean;

Before you let your opposition vex us,

Acquire a knowledge of the *solar plexus*.

He says (confront him, then! does he not court

Investigation? nor pronounce him liar,

Until you've proved his falsehood. Would ye thwart

His plans, inflamed by mercenary ire?)

It is a panacea (nearly) fraught

With blessings to our race. If ye desire

To benefit mankind, adopt, refute,

As best you can; if not, be silent, brute!

QUIZZICUS.

P.S. As I hate all *blarney*, I have nothing more to add than positive (+) added to negative (−) = 0; that is, inserted or rejected, I care not which.

—Why don't your learned coadjutor explain his signs? What the devil do we know of mathematics? With all submission, it smells a little of the marvellous = quackery.

(1) For *Alpinus*, the Alpine Philosopher.

(2) The manner in which the doctor pronounces the word *bipolarity*,—an Italianism.

(3) See your invocation to all the fools in the universe, in No. 39 of the *Shepherd*, at the conclusion of the article on "Woman."

(4) "*Audi alteram partem*"—*Hear both sides*.

Dr. Lardner, we understand, has contradicted the report or opinion said to have been circulated by Sir John Herschell, that the comet would not make its appearance this year, according to the expectations of astronomers.

DIALOGUE BETWEEN AN ATHEIST, DEIST,
OLD CHRISTIAN, AND UNIVERSALIST.

Atheist. There is no God. Nature is merely an assemblage of conflicting powers, governed by a blind necessity. The evil that prevails in human society is a satisfactory proof to every reflecting mind that there can be no supreme intelligent principle to superintend the actions of mankind. But the evil is not confined to human nature alone; it pervades the whole animate world. The law of cruelty and utter unconcern for individual happiness, which seems to be the prevailing feature of what the Christian calls Providence, conveys to my mind no other idea than that of universal death, non-intelligence, and chance.

Deist. These evils in human society and general nature originate in the blind and indiscriminate action of the great laws of the universe, and afford no proof of the self-existence of those laws. A machine may be guilty of many irregularities, and produce much individual mischief, which still depends for its existence upon a master-mind, who contrived and executed the whole.

Atheist. There could not be much skill in this master-mind, if this masterpiece of his was so very defective in its operation. Ingenuity and skill are only demonstrated by success in the execution. I consider Mr. Babbage's calculating machine as the work of a master, inasmuch as it calculates unerringly. But this God of yours is a blundering fellow, who not only contrives the thing badly at first, but cannot even rectify the blunder after it is perceived. What is the use of him, if Nature does all the work, and he never interferes to rectify her blunders? If Nature does one thing without God, why may she not do every thing? why not exist without him? I cannot see any use for a God at all, even upon your own principles. If Nature makes one leg longer than another; if it diseases a brain, a heart, or a liver; makes one person beautiful and another deformed; creates evil passions, thoughts, and intentions; and God has no hand in all this, why may not Nature do the rest? I can see no use for anything but Nature and her everlasting laws.

Christian. You greatly err, not knowing the Scriptures, nor the power and justice of God. The evil that prevails in the world is not natural to Nature, but superinduced upon it by the author of all wickedness, whom God has permitted to lay desolate the moral and physical world, to punish man for his primitive transgression. If you had correct views of the immaculate justice and spotless purity of the Godhead, you would at once understand the reason why his once fair Paradise and garden of Eden has now become a waste and howling wilderness. It is the just and righteous retribution of God for the sins of our first parents.

Atheist and Deist. Fiddle-de-dee!

Atheist. Is God the author of evil?

Deist and Christian. Certainly not.

Atheist. Then you cannot prove the existence of God at all; for one half of nature, according to your own acknowledgment, is corrupt; nay, the Christian allows that the whole is corrupt; and if God is not necessary to give this evil a being, I cannot see the necessity of re-

sorting to the supposition of a God to give existence to the remainder.

Christian. You mistake the question entirely. The evil is not an original creation, but merely a corruption of the original; it is merely a thwarting of the purpose, or a marring of the work of the almighty artificer.

Atheist. You may call it what you please; it is an original something; it is a principle of corruption, an active principle, a creative principle, an organising and disorganising principle; and yet a principle in the creation of which God had no hand, and one which does not belong to his nature. I see nothing but this principle in existence: it is all over Nature. Your God is a phantom.

Christian. You would not certainly affirm that organised beings, such as animals and plants, could be created without the designing and executive power of an intelligent being?

Atheist. In affirming this, I only affirm what your own doctrine confirms, namely, that there is an organising and disorganising power in Nature, which is not God. All the difference between you and me is this, that I see no other power but this, and you superadd another, whose existence you cannot prove, because your own doctrine contains an article which is identical with atheism; namely, that Nature is corrupt, and does corrupt things without the power of God; that is, by a native power of her own.

Christian. Nay; not an inherent self-existent power of her own. The power which she employs is the power of God; but she abuses it to a corrupt purpose.

Atheist. That is an absurdity; for according to your own creed, the power of God is his "will"; and to say that any one uses the power of God against his will, is to say that he uses the "will of God against God's will," which is nonsense. If ever the existence of a God be demonstrated, it must be by some other logic than that of priests or any of their illogical followers.

Universalist. Very true; their logic only serves to refute themselves, as you have very clearly demonstrated: God must either be acknowledged to be the author of everything, or it is impossible to prove his being at all. If any part of Nature can act without him, the whole of Nature may dispense with his existence. The atheist has more sound logic in his system than either the Christian or the deist, who refute themselves by acknowledging a power in Nature which is not God. Yet the atheist is guilty of a most marvellous *stultism* of the same species, in supposing the whole power of Nature to be of this description, which the deist and Christian call *not divine*. Why should the atheist choose death and ignorance for his universal power of nature? Why not choose life and knowledge, and make his God a living God, instead of an unintelligible, because unintelligent, unconscious nondescript. My own opinion of God is, that he is the author of everything, of evil and good, both in the extreme and the degree; that evil tends to everlasting good; and that a time will come when he will be fully justified before all his creatures.

Atheist. Whether this doctrine be true or not, it is at least reasonable. The doctrine of the priest is an insult to reason. What think you, Mr. Deist?

Deist. I have no particular objection to universalism ; only it never before occurred to me ; it seems to me satisfactory.

Christian. It is a damnable doctrine ; and the best proof of its impiety is the facility with which it is adopted by infidels and blasphemers.

Universalist. Thus argued the Pharisees concerning Christ of old : "He must be a sinner, for he associated with publicans and sinners ;" but he wisely answered, "Verily, verily, I say unto you that publicans and harlots shall enter the kingdom of heaven before you."

ON MENTAL DISEASES.

LETTER VI.

Grau, theurer freund, is alle theorie,
Und grün des lebens goldner baum!—*Goethe.*

Dear friend, all theories are gloomy :
The golden tree of life is evergreen.

LAST week our friend the *Disseminator* deprived me of the pleasure of continuing my rhapsodies on love, and on the diseases which spring from this one cause ; but to-day, or rather to-night, no power on earth shall turn me away from my work. I enter boldly upon the subject, without any other preamble. I will speak upon that passion which is the negative of the positive pole of love, namely, that green-eyed monster, yclept jealousy.

People who have never loved, or whose love never exceeded more than one line over the freezing point of indifference, have wasted a great deal of labour in showing that true love ought to be exempt from jealousy. It would be as rational to say that light ought to be exempt from shadow. Jealousy follows love, as the shadow follows the light. Where love is, there jealousy must be ; and *vice versa*.

As long as the negative pole is in harmony with the positive, jealousy serves to increase the power of love. Unfortunately, however, this harmony is sometimes disturbed ; and when this occurs the mind is immediately deranged.

The first degree of derangement shows itself by a despotism of the imagination over the mental faculties. This busy-body compels the causality, the memory, and the comparison, to exaggerate and to misconstrue all the actions and omissions of the real or imaginary deceiver. To argue against a jealous being is as useless as to speak with the blind-born about colours.

Openness, kindness, and a delicate behaviour in him or her who is suspected, would be the only remedy against the incipient disorder. Yet the innocent grows generally sulky and ill-tempered, and the guilty either delights in tormenting the unfortunate victim of his fickleness, or endeavours to conceal under false demonstrations his treachery. Under such circumstances jealousy increases, and often assumes that horrible shape which has furnished the poets with the most pathetic subjects of tragical composition, and has brought so many unhappy victims to the scaffold, or to the mad-house.

Horrible wretchedness, when love turns into rage, when despair, like an evil spirit, seizes hold of reason, and drives the mother to smother her child, the lover to de-

stroy his mistress, or the wife her husband ; or when all the faculties of the mind are, as it were, sacrificed before the satanic idol of tyrannical imagination ; when the circulation of the blood, the action of the nerves, and the digestive faculties, are either paralysed or brought into that state of irritation which constitutes the mania !

This disease, being originally mental, requires a treatment particularly spiritual. But here I must beg leave to explain myself upon my views about the mental and physical diseases in general :—I consider life as the oscillation between two principles, the positive or spiritual, and the negative or corporeal. I consider health to be the harmony resulting from the just proportion between the action and reaction of the two principles. The disease is also a life, but a life in which either the negative pole disturbs the harmony by endeavouring to overturn the just proportion, or when in any part of the systems of the two poles there occurs an increase or decrease of activity, that causes the discord in the system of which it forms a part.

Since life consists in the oscillation of the two principles, the spiritual or positive pole cannot exist without the corporeal ; nor can the corporeal or negative exist without the spiritual, or positive ; but as both are the integral parts of the one life, they must be in continual action and reaction. A disease of the one must cause a disease in the other. Rage causes a congestion of blood in the brain ; a congestion of blood in the brain causes rage. Melancholy causes debility of the digestive organs ; debility of the digestive organs causes melancholy.

Under these circumstances, it is the duty of the philosophical physician first to study the nature of the disease, secondly to ascertain the cause from which it originates. It is true that it will not always be in his power to remove the cause ; but it is sufficient for him to know the cause, in order not to destroy the healing power of nature by a blind mechanical treatment, suggested by the mere valuation of symptoms ; for, in cases like those of mental derangement, produced by jealousy, it is not in the power of the philosopher to bring a fickle Lothario, or a Don Juan, to restore the disturbed peace of a distressed woman ; yet, by spiritual schemes, it is more likely that he may succeed in appeasing the irritated mind, than by the juice of elaterium, and helleborus, or other chemical preparations.

A lady in H., had been seduced and deserted by her lover. She was left pregnant, and exposed to all those evils with which our social refinement often crushes down for ever some of the most noble-hearted of woman-kind. She had no mother, no sister, no friend, to whom she could open her heart. Her relatives were all proud, bigoted, and tyrannical ; and this unfortunate woman was well-bred, highly accomplished, handsome, and but eighteen years old.

What wonder, that the mind of this lady became diseased ! A friend of mine, who bore some resemblance to her seducer, one evening, whilst returning from a party, was attacked in the open street by a woman, and received several cuts with a knife ; I arrived in the moment of the scuffle, and we both succeeded in disarming the fair assailant. When she saw herself overcome, she

threw herself on the ground, and screamed; after a while she fell in a swoon. I was moved to compassion, and insisted upon my friend running for a hackney-coach, and taking her home.

When she awoke from her swoon, she found herself on a sofa, amongst perfect strangers. She burst out into cries, and ran to the window. "Lady," said I to her, in a firm, but mild tone, "if you will go away, there is the door open. You are perfectly free to stay or to go. If you stay, you will find friends and protectors; if you go, you will find insults and violence." She gave no answer, but remained quiet. She looked at me, at my friend, at his wife, threw herself on the floor, and again fell into a swoon. I ordered them to put her to bed, and leave her alone in the dark.

The next morning I found her still in bed. I entered her room with the lady, and asked her whether she wished for any breakfast. She gave no answer. I retired, and ordered some toast and tea to be taken into her room, and that she should not be disturbed.

Towards evening she entered the drawing-room. She had dressed herself, and had eaten some toast and drank her tea.

For three weeks she lived thus with my friend, without speaking a word; nor having any other meal but toast and tea, and a bottle of spring water. During all this time I saw her regularly twice a-day, and, without entering into any conversation, gave her to understand that she was perfectly at liberty to go or to stay; but that if she stayed, she would find sincere friends in us.

After three weeks I found her ill in her bed with a violent fever. In the state of delirium she confessed to me all which had passed; gave me her name and address, with all the particulars. The fever lasted twenty days, during which time I gained so much of her confidence, that I could venture to form a plan to cure her mental disease.

The plan was to awaken in her the most tender maternal affection; to kindle in her bosom the idea of the happiness of sacrificing herself for the dear image of her love; at the same time to prepare for the reception of the new comer. The high respect that every one in the family paid to her; together with plans for a new mode of life, which would secure her afterwards an independence, brought by degrees this unfortunate woman to her senses.

Surely Providence was kind to her, in having made her insanity the cause of her cure. For certainly, had she not mistaken my friend for her seducer, she would have been thrown into a prison, or into a lunatic asylum. In this case the treatment was principally mental, and the cure was perfectly successful. By similar modes, even the most violent fits of madness from jealousy can be cured.

THE ALPINE PHILOSOPHER.

NATIONAL EDUCATION.

Amongst the persons who stand prominent in the ranks of English educationists, first and foremost is Lord Brougham, who is a propounder besides of all sorts of schemes in addition to this, for improving the condition

of the "lower orders," as he calls them. His views, indeed, upon the subject of education are so lofty and magnificent, that he speculates actually upon turning mowers and reapers in time into philosophers, like himself, who after coming home weary with the toils of the day, instead of eating their supper and going to bed, as a real philosopher would be inclined to do under similar circumstances, shall sit down to study Bacon and Locke, and meditate upon the perfectibility of man. With these fine notions characterizing his lordship in theory as a warm and ardent friend of working men, we find him nevertheless in practice the consistent and steady promoter of every plan that is calculated to circumscribe and diminish their little comforts; of Peel's Bill, of free trade, and of an unlimited use of machinery; especially the latter, he being perhaps its most distinguished advocate. He informs us indeed that spades were made before ploughs, and fingers and nails before spades, and that as spades were an improvement upon fingers and nails to dig the ground with, so ploughs were an improvement upon spades, to show how civilization could not proceed without machinery, and that it is the superiority of his machinery alone which constitutes the great difference between the civilized man and the savage. He has been at the pains too of explaining all these things to labouring people in a variety of cheap publications, professing to teach them "useful knowledge," with which they were previously unacquainted. He might have saved himself the trouble; for the greater part of them know quite as much as he does on this very subject. No sensible working man disputes the utility of machinery generally; he only disputes its utility under particular circumstances, when it is depriving him of employment and subsistence, and when the whole advantage of it is exclusively reaped by the monied capitalist and public consumer. Seeing this, he cannot approve of its present application, and he justly considers that inventions of machinery ought no more to be suffered, in an unrestricted state, to rob him of his wages, than any other inventions, such as ingenious and clever people are in the constant habit of contriving for extracting the money out of their neighbour's pocket. The hand-loom weavers have been robbed of their bread by the power-loom; as the power-loom weavers would be robbed, in turn, of their bread, if a superior machine could be invented to supersede the use of the power-loom. A state of freedom like this, in the use of machinery, is nothing but a system of legalised plunder directed against the property of the working man, which must be rectified, or society cannot hold much longer together. Lord Brougham's tracts are mere rubbish; they teach no truths beyond what are already known, whilst they inculcate a multitude of falsehoods, of the most pernicious tendency. His arguments, with regard to machinery, go to prove that, because it is in the abstract a good, it has, therefore, no limits, but may be indulged in to excess, under all times and circumstances; a doctrine as false as it is mischievous. They go to prove that, if it were possible to erect one great steam-engine in every county, capable of doing the entire work in it, without the help of hands, the working people throughout England would be great gainers by the change. They prove this, or they prove nothing; and more is not wanted to show the utter fallaciousness and absurdity of the doctrine. If his Lordship would inform the working people, how, if inventions in machinery be allowed to go on multiplying as they do at present, and no inventions be discovered for multiplying markets as fast as machines, they can be saved from ruin and starvation; or how, if their ruin be not otherwise to be prevented, it is possible to place three

inventions under some judicious but effective restraint for their advantage, without its being the means of stopping the steady and well-directed progress of human improvement, they would feel extremely obliged to him. Upon all these points, however, Lord Brougham is as much in the dark as the people themselves. Mr. Cobbett exemplifies the folly and mischief of these schemes of national education, by stating, what he has stated over and over again, and what also is undeniably true, that the moral character of the agricultural labourer has been declining in a most marked and rapid manner ever since national schools first began to be introduced upon their present extremely confined and limited footing. That the young men now growing up, who have received an education in these schools, are less sober, less honest, less industrious, and know less of their respective businesses than their fathers, who have had no education at school at all. That the mind of the rising generation has been even poisoned against its own interests, and rendered more inclined to promote the ruling interest of money than its own, by the lies and nonsense with which it has been crammed: and he proves his assertions by pointing to the fact, which is, indeed, notorious to every body, that just in proportion as of late years the trash called education has been forced into people's heads, good raiment and solid food has been passing away from their backs and bellies.

The conclusion to be drawn from these several matters is, that of all foundations for a government to rest upon in the present ill-contrived state of the social system in this country, education is the very worst; as its only tendency must be to teach the nation the most scientific methods of plundering itself, the art, in fact, of self-destruction. It is thus, so far from being likely to act as a preventive of a Revolution, it is, on the contrary, the very thing that is calculated to bring one on with greater certainty, and further, to make it more disastrous, more sweeping, and more terrible, when it does come.

The march of intellect (according to the phrase invented by the self-laudatory and arrogant spirit of this self-governed and most conceited nation), is nothing but the march of youth against age, of inexperience against experience, of children against parents, and servants against masters; of cunning against simplicity and honesty, of folly against wisdom, of the idle against the industrious, of consumers against producers, and of money against land: it is the advancement of all the vices that have ever characterised human nature, and the retrogradation of the virtues; in short, it is the march of moral and political ignorance, cant, and superstition, opposed to every thing that has been hitherto deemed valuable by man. Never was the English nation half so ignorant of all really useful knowledge as it is at the present moment; never was it so completely the dupe of every political, moral, or religious impostor, who starts up to betray it, as now.—*Bernard's Theory of the Constitution.*

[This is just the result contemplated in our leading article; namely, that evil is to be destroyed by progressing. But Mr. Bernard seems to think it better to put a stop to it, by going back upon old principles. It is impossible however to go backwards. Evil will destroy itself by repletion. The only cure for competition is to carry it to perfection. Whether Brougham or Bernard be the best politician, the views of the former upon progress and education, at least, are most likely to be realised. Old men are generally attached to things as they are, or formerly were. Young men contemplate a better system than even their fathers and mothers, happy as they might have been, ever imagined. This is all in perfect ac-

cordance with the analogy of nature; namely, that the advocates of old principles should be the old, and the advocates of young principles should be the young. Mr. Bernard is correct enough in his description; but he seems not to imagine that it is the natural and best mode of progression.—*Ed.*]

IMPRISONMENT FOR DEBT.

WE formerly argued that the law was detrimental rather than advantageous to the fair and honest trader and shop-keeper, because it induced a system of false credit, which produced more apparent than real custom—a custom always unsound—often ruinous both to the trader who trusted, and the purchaser, who, by such facility of credit, was tempted to live beyond his means. In a little work which is just published, and which is stated to be from the pen of a “Barrister of the Middle Temple,” there is some cogent reasoning upon this part of the question founded upon practical observation. We quote the following passages. The object of the writer is to show that, by the abolition of arrest for debt, what is lost in custom would be gained in soundness of credit. He says—“Able at any time to imprison his debtor, the creditor is always on the alert for custom. His eagerness encourages purchasers: he considers the certainty of recovering his money by enforcing the law—they calculate the probability of paying from their expected resources. Accustomed to the aid of the law for protection against the person of the debtor, he is not active in adopting precautions respecting the property. He trusts without due enquiry, and is imposed on by appearance. Every inducement is thus afforded to a class of adventurers, who speculate upon the possible chances, rather than the ordinary courses of trade. To such persons success is profit without outlay, and *insolvency a passport to the privileges of the law.* Meanwhile the creditor extends his connexion—orders are multiplied—he displays a large assortment of splendid stock—has crowded counters, and a long list of bad debts—he must, however, supply the deficiencies—at last he is driven to dispose of his goods at any rate—to deceive the public by puffing, and to injure the trade by underselling. The shops are full—*so are the gaols.*”

“By disarming the creditor of a power which he has overrated, he will appreciate the value of *self-protection.* In commerce the magnitude of its concerns creates caution. The success of the merchant is promoted more by his own exertions to preserve credit than by any legal enactments to protect it. So the tradesman will learn to exercise greater prudence—he will look less to chance gains than to certain profits. Thus the discontinuing of the arrest will check unwarrantable confidence, and discourage a system of unprofitable speculation.”

The writer then proceeds to show that the increased power to be given by the law to the creditor over the property of the debtor will be far more than an equivalent for the abandonment of the power over the person, which is oftener the means of gratifying a vindictive feeling, to which the law should never minister, than of affording protection. With regard to the effect of imprisonment upon the debtor, he says—“Imprisonment is more to be deprecated in the instance of an honest man, than desired as a punishment even for the guilty. It deteriorates the debtor—diminishes the chances of the creditor, and operates injuriously on public morals. If the debtor have property, it impoverishes him by legal demands and prison disbursements. Had he skill or industry, he is incapacitated for exertion—he can earn

little for himself—nothing for others. Had he position in society, influence and friends, he is degraded—had he character, that is destroyed—had he honesty, expectations and prospects in life, which are often the creditor's last chance, even that is endangered by a course which leads to the demoralizing of principle—the hardening of the heart—the extinction of the last ray of hope." The evil consequences of imprisonment for debt are here strongly portrayed; but the force of the picture is in its truth.—*Morning Herald*.

PHRENOLOGY.

THIS word means the "science of mind," and therefore, strictly and etymologically speaking, it is not solely confined to that department of science which some have designated by the name of "Bumpology." The latter is evidently a science supported by many important well-authenticated facts, but it is merely a part of the great science of phrenology, which does not confine itself to bumps alone, but extends to the whole nervous system of the body. Bumpology is merely the materialism of phrenology—the department of death; therefore it stops wherever motion or expression begins. It scrutinizes the shape and character of all the crown of the head, but its sphere of observation is intercepted by the eye, the ear, and all the other organs of intellectual expression. These latter are the department of what is called physiognomy, which is however merely a department of phrenology, and so necessary to the full development of the latter, that phrenology will always be an infantine science, until physiognomy be united with it. The one is the department of life and spiritualism; the other the department of death and materialism. The latter is the rage of the present day; but there is a move backward already commenced, which no human effort will be able to counteract. Spiritualism will revive.

TWO LITTLE WORMS.

ONCE upon a time, when men were monkeys and monkeys men, two little worms, belonging to a human stomach, conversed as follows:—

First worm. I cannot hold with your doctrine of life; I see no appearance of a universal life in the human body; there is only life in individual worms such as you and I.

Second worm. Then how does it happen that the body is so compactly fitted together, and that all its members seem to act in concert? We have lived in this capacious stomach all our lives, and we find it abundantly supplied with provision again, as soon as the absorbent vessels have exhausted its former contents; the other members are all dependent upon this for supply; and are we to suppose that the stomach itself is not also dependent upon an over-ruling mind in the universal man, by which its wants are supplied from a source unknown? The whole man must have a united mind and will as well as ourselves.

First worm. It appears to me that the stomach is supplied merely by necessity. It is a law of nature that whenever a vacuum takes place any where, there is a tendency in the surrounding elements to rush in and fill up the vacuity. What you call the effect of an act of the will, I call merely necessity; you can give no proof of the existence of this mind; it speaks not, you see it not; there is no personality in its movements. Your faith is founded upon mere fable and tradition of worms, which are said, in former generations, to have ascended the throat, and seen what they call a mouth and teeth, and a bright light without, where arms, legs, and other mem-

bers, were visible; but these are merely the visions of fanatics, and are unworthy the credit of a rational being, who judges of nature from facts only. I believe in no personality or individuality of will, mind, or consciousness, higher than our own.

Second worm. This doctrine exceeds my comprehension; but we shall talk of this at another time, for I perceive the smell of some delicious roast which is making preparation to descend into our already exhausted store, a timely godsend which never fails, and whose regularity convinces me there is more intelligence in this great human system than your atheistical notions will admit of.

ERRATUM.—In last number, first page, first column, four lines from bottom, for "two" read "asymptotes and."

CORRESPONDENTS.

We have read patiently P. A. S., and are very much pleased with her present state of mind. It is to universalities, principally, that we look. Mankind will always differ upon particulars. We are afraid, however, that she has misunderstood us on the subject of marriage. Indeed, we were conscious that we were treading on very ticklish ground when we alluded to the subject, and felt certain that we were exposing ourselves in a most hopeless manner to female conjectures. We can only take refuge in our own motives. If any one supposed that we were defending a system of promiscuity, it was a gross mistake; or a system of lordly supremacy on the part of the male: it was equally erroneous. There is none more convinced than ourselves that love is an individualist or monopolist by nature. All that we meant was a facility of separation between two parties, when they could not live in harmony together; a facility, in fine, of making such matrimonial connexions as would contribute to the happiness of both parties. No reasonable person can be opposed to this; and as to the details of any measure of legislation, we leave them to the spirit of the age, which is the best compass by which to be directed. Any thing like roaming or raking in love affairs, was as far from our thoughts as heaven is from earth. We don't think such conduct natural to man; it would be cured in a twelve-month in any individual, by merely giving him his fill of it. But it will be effectually stopped whenever society is so reformed as to destroy the infamous system of prostitution, which is the main cause of all the immorality and licentiousness of the male sex. Whatever suspicion may attach to our mode of expression on this subject, our wishes are in harmony with the most perfect chastity and individual affection; and if we said it would be dangerous to alter the marriage laws at present, it is so only because they are so intimately connected with the laws respecting private property, that they could only be altered to the disadvantage of woman, until the property laws are reformed.

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 11th inst., at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 38.]

SATURDAY, MAY 16, 1835.

[Price 1d.]

SYSTEM OF NATURE.

WE shall now, according to promise, endeavour to arrange the leading principles of Universalism in such a manner that any person shall be able to take hold of it as a system of doctrine, and defend or oppose it as he feels disposed. There are some who suppose, from its accommodating spirit, that it is no system at all; that it can be anything or nothing, according to the humour of its disciples; that, because it maintains the rectitude of every doctrine and every system, itself can have no doctrine and no system. But we hope to demonstrate that, with all its condescension, its charity, and conciliation, it has a straight and decided course of its own; a course in which all other courses meet, and towards which they all necessarily tend. It is therefore a system which is not different from, but merely in advance of, all other systems; the ultimate resting-place of the progress of human experience.

Universalism sets out with the mere proposition of the existence of the universe. It then separates this universal existence into a twofold character, which may be designated by any two opposite and universal terms in the language. These two we have chosen most frequently to call action and passion, positive and negative, &c. Mind and matter are the representatives of these two extremes; mind being the active and positive; matter the passive and negative. The former is what we call God, the spirit of the universal organization; the latter is what we call Nature, the outward and visible representative and habitation of the invisible agent.

With this universal being as a whole, there can be no progress. He can never move from place to place, for he fills all place; he can never acquire knowledge, for he contains all knowledge; he can never reason, for reason implies previous ignorance of the conclusion to be sought. In fine, as a whole, he is incapable of motion, either in mind or body; and presents to the finite imagination the nearest approximation possible to the image of death itself.

But it is only of God as a whole that these affirmations can be made. Because he has no external, no outward shape, he can have no external, no outward action, like man. The action of God is all within; and here he is full of life and action, and the different portions of his internal system exhibit all the gradations of high and low, first and last, better and worse, in proportion to the quantity of useful power which each individually or generically possesses.

The mind being the active principle of the universe,

has organised and arranged all the internal component parts according to its own will, and given to each and all of those parts the emblematical image of its own twofold nature. This mind, which is both active and passive in itself, conveys to matter the same twofold character; but mind still contains the primitive principles both of activity and passivity; matter is merely its agent and vicegerent. It is difficult to define what matter is, having no fixed character, and capable of infinite decomposition. It has no primary, but only a secondary existence, as the representative of mind.

In contemplating the plan of the universe, we must observe that there are only two modes in which it can be developed, namely, space and time. In both of these, therefore, we look for the two extremes—the positive and the negative, to which we have alluded. But it must be evident to every one, that, in manifesting the two natures in these two modes, they assume very different relative positions. Thus, in manifesting the two extremes of light and darkness in space only, and connecting them with vision, which is the effect of their union upon the eye, they stand thus—darkness, vision, light; vision being the centre, where the two meet. But in manifesting them in time, they come in succession, as follows—darkness, light, vision; vision being last, as the result of the action of the other two.

From this simple illustration it follows, that in the progress of society, from the one extreme of blank experience or ignorance, to the beau ideal of human perfection, God, according to the universal plan which this simple analysis of nature teaches, must divide the progress of society into three successive stages, resembling the above. This he has done in the two great stages of progress commonly called the Law and the Gospel; whilst the third is promised, in which the deaf shall hear the words of the Lord, and the eyes of the blind shall see out of obscurity and out of darkness.

The beauty and propriety of this plan can be visible to the student of Nature only; the bigot, whether he be what is called a believer or an infidel, can neither see nor understand it.

Men were primitively scattered in ignorance, which has no uniting principle within it. It was designed by their Creator that they should be gathered again; but gathered only in such a manner as should fully develop their own reasoning faculties, and lead them to a rational demonstration of the being and character of God, his plans of Providence, and their own destiny in creation. This is the highest and the noblest intention which a benevolent, almighty, and omniscient being could enter-

tain ; and there is only one way of accomplishing it which is intelligible to the human mind, namely, that of giving a revelation, which would be unintelligible to man in a state of scientific ignorance, but perfectly clear and intelligible when science had reached, by his own intellectual exertions, a state of comparative perfection. By giving such a revelation, it is evident, in the first place, that great evil would be produced by the conflicting opinions of individuals and sects. This, however, is a part of the plan of discipline which is to lead men to the full development of their intellectual and moral natures, to which there is no other road than the thorny path of bitter experience, by which the latent energies of the mind are roused to overcome the obstacles which oppose our progress. Had this revelation been intelligible at first, it could never have exercised the mind ; and had it never been given at all, man could never attain to a knowledge of God, and the universal plans of Providence : society would be a rope of sand for ever, and man a hopeless, cheerless orphan, with no other prospect before him than that of a grave and everlasting gloom. This was too cruel for such a spirit as that which rules over the harmony of universal Nature, and can only be suspected by the wandering minority, who, unable to understand the riddle of Samson, turn round upon the heel with contempt, and sagaciously deny that ever Samson gave the riddle, or that any man can comprehend it.

Revelations have been made in all ages and in all countries ; but there has been only one universal, progressive, successive, and connected revelation, throughout the course of time. This revelation formally began with Abraham, grew up and flourished in the Jewish church, afterwards embraced the Gentile world, and now bids fair to spread its wings over the whole habitable globe. In selecting an individual man or nation, or number of nations, there is neither injustice nor partiality, as some foolishly imagine, inasmuch as no particular favour was bestowed upon them ; on the contrary, the active servants and apostles of revelation have always experienced worse treatment than others : the prophets were almost universally unhappy ; the Jews were tossed about on the very cliffs of political and social troubles ; and Christendom itself, the inheritor of the mysterious present, has been dyed red with blood again and again through the instrumentality of this mischief-brewing agent of divine discipline. It is foolish to talk of favour where no favour is visible ; nor would it ever have been imagined, had it not been for the monstrous doctrines of election and reprobation, which consigned those who did not know, believe, or understand this unintelligible revelation, to the flames of hell for ever. This inquisitorial doctrine alone suggested the idea of partiality, in bestowing a revelation on the Jews ; but the two ideas vanish together.

All difficulties respecting revelation fly before universalism. It becomes so simple, that to imagine it otherwise appears a total perversion of intellect, or implies an utter ignorance of the very elements of universal truth. This revelation has grown like every other natural production ; it has been entrusted to the most progressive and intelligent nations, in order to facilitate its progress to-

wards universalism ; it has associated itself with the most powerful governments ; it has employed in its service the greatest talents, and the most profound researches of learning ; it has collected around its own person a body-guard of physical, intellectual, and moral strength, to which there is not, and cannot be, a rival found ; and every people, every tribe and tongue, with a very few particular exceptions, are becoming partially acquainted with its antiquated dogmas ; yet it seems to totter and fall in the very centre of its own vitality, to be withering and drying up at the very source, from whence it issues forth its streams of missionary and tract instructions to the remotest corners of the earth.

But this decay of religion is merely an illusion ; it is a grand work of preparation for the universal gospel. The gospel of condemnation has had its reign ; it is commensurate only with human ignorance, bigotry, and intolerance. When the Almighty, therefore, begins to destroy this temporary system of intellectual infatuation, he simply raises up a *negative* to batter and destroy the old *positive*, and prepare the way for a *new positive* and new negative in friendly union. This negative is infidelity, God's battle-axe and weapon of war, with which he breaks down and destroys the old rotten system of Antichrist, and then throws the weapon aside as a piece of useless old iron, which has no life, action, or system within it. While this weapon is at work, however, battering, and besieging, and levelling the old Jerusalem of the saints, and bringing all its doctrines, its forms, and ceremonies into public odium, the spirit of revelation is slowly and gradually rising up out of the dead letter of the word, and revealing the naked truth to a few minds who are in advance of the rest of the world, and prepared to lay the foundation of a new religion, which shall embrace all the hope, the glowing enthusiasm, and ardour of the old, along with the liberality and universal toleration which is advocated by the infidel party without the spirit to manifest it either in words or actions.

This is the simple process of universal Providence, intelligible, when pointed out, to the capacity of a child, yet unknown even to the greatest divines, philosophers, politicians, or liberals of the present generation ; notwithstanding, they are all working in the good cause with a bandage on their eyes. The clergy are ruining their own cause by their folly ; the philosophers are hastening on universalism by their discoveries ; the politicians are paving the way by removing many minor obstructions, and the liberals by breaking, and battering, and beating down indiscriminately all standing systems, in the full conviction that there can be no mistake.

The work of God is developing itself to the liberal and enquiring mind. The spirit of revelation is peeping out from behind the curtain of mysticism ; the hopes of faith are becoming more and more plausible and intelligible by being divested of their diabolical cruelty and partiality ; and the dawn of that happy era, foretold so long ago, and anticipated with such ardent hope by the faithful of former generations, is now fairly arisen in the minds of both believer and infidel. Nothing now can prevent the full realization of the promises and the plan of human redemption ; such redemption as will include the species,

and declare the Divinity to be no respecter of persons, nor such a simple old fool as to bestow the blessings of salvation on priests and their contentious and illiberal followers only, but the God who has promised that all men shall see his salvation and his glory.

This fact is now evident to unaided reason; but when it is confirmed by revelation, and the two join hands upon a point of dispute on which they have long appeared to be at irreconcilable variance, and when this union is corroborated by the discoveries of science, which are all reducing the knowledge of Nature to such universal principles as fully accord with the whole mystery of Revelation and Providence, what a new field of study and of admiration is opened up! What a splendid pedestal of faith and of hope is reared upon a foundation which includes the universe itself, and against which not even a breath can blow, or a storm can beat, which will not increase its beauty and stability!

THE SHEPHERD.

ON MENTAL DISEASES.

LETTER VII.

O that the desert were my dwelling-place,
With one fair spirit for my minister;
That I might all forget the human race,
And, hating no one, love but only her!—BYRON.

I MUST once more turn my regards to love. I confess it is a favourite subject of mine, and in parting from it I am like to him who leaves his native land. As long as the vessel is in sight of land he cannot leave the deck; but is forced by magnetical attraction to stand and to look until the curve of the main deprives him of the last faint outlines of the beloved shore.

There are several of my readers who, misled by some good-meaning but puny-brained philosophers, think that love is but an artificial plant, and not to be found in human nature. They fancy, that in a more rational state of society (that word "rational" is here a very queer one) there will be nothing of that mystical love that engenders jealousy and other passions, but all will proceed gently like milk-and-water. "Well-bred people do not quarrel," said one of these wise masters of Israel to me, "about the slices of meat that the carver places upon their plates; they do not grow mad when they cannot get the favourite dish. When we have better arrangements, the same will happen with the affections among the opposite sex." Indeed, when I hear such nonsense spoken, men's minds are to me like musical instruments out of tune. Happily Nature has taken care that such a change shall never take place. If it was possible, mankind would return to a state of primitive brutality.

Love is, like the fine arts, the finest and last production of Nature. Nature first produces the rough materials, earth and minerals; then the more sensitive plants; lastly, the most perfect organization. The same line of progressiveness is found in mankind. The human race first appears in a state of animalism; their wants are the mere necessities of life. Men then live like herds of cattle. By degrees this animalism gives way to humanity; the useful takes the place of the necessary. Mankind

progresses still; the beautiful and the honest become the standard of civilization. As the flower is the last and finest development of the plant, fine arts and love are the finest development of mankind.

But as the finest flower has the finest texture, and the best organized animal is the most subject to disease, in the same way the finest development of human sensibility is most liable to mental disorders.

Love being the centre of human animalism, it embraces both the right and the left, the positive and the negative, the sensitive and the vegetative system. A mental disorder arising from love affects, or may affect, all three systems of our organic frame. There is certainly a love above this love, as there is one indivisible spirit above the spirit which is the positive pole of matter, which love is also above disease. But I am speaking as a philosophical physician, and I treat of love as the most potent of our human affections.

The diseases of the mind arising from this centre must also be cured with a power proceeding from a corresponding centre. Love must be cured by love; yet the love which will cure a disease must draw its magical power from that love which is above disease. In this sense, if practical proof be wanting, we may convince ourselves of the truth of the Scripture, that "had I all knowledge, and could speak with the tongues of angels, yet without charity I were nothing."

And here it is necessary to observe, that the most powerful influence of magnetism must also proceed from the same eternal centre. The magnetic action depends on the concentration of the will; but the individual will is nerveless unless identified with the eternal will, of which it is but an instrument. This will, as an active principle, produces a reaction, establishes a spiritual affinity, and begets an intellectual offspring. This spiritual affinity is the healing principle by which the cure is begotten. Among the many diseases of the mind produced by love, there is none so singular as that which occurs in some individuals, who in all respects seem to possess sound judgment, a sober imagination, a healthy bodily constitution, and, generally speaking, the characters of rationality, and yet in some points are absolutely insane.

I have often compared them to a harpichord, in which all is perfect except one high key. You can play the instrument for a good while without perceiving the defect; but if, unfortunately, you touch upon the ill-fated key, it jars, and a sudden discord destroys the magical effect of the most enchanting tune. As often as I witnessed such instances of partial insanity I was overwhelmed with sad melancholy. The image of God seemed one transformed by some charm into a disgusting caricature: no wonder if, in darker ages, such beings were deemed to be possessed by evil spirits!

Once I travelled with two ladies, mother and daughter, the second of whom appeared perfectly sound in mind and body. One evening, on entering the dining-room, the young lady gave a shriek and fell to the ground; I relieved her, and led her to the sofa; she began to talk incessantly the most inconsistent and even indelicate nonsense; she sang, she whistled, she cried, in turns, she

tore her hair ; all with the rapidity of the lightning. The mother wished her to be carried by force into the bedroom ; and told me that her daughter had formed a fatal connexion with a military gentleman, who had forsaken her, and thus caused her insanity. This state, however, was transitory ; she could remain in her senses for several weeks, after which the disease broke out on a sudden by fits and starts, without any apparent external excitement.

I persuaded the mother not to use any violent means, but let her talk and rave at pleasure. My advice was followed, and, after a couple of hours, the young lady sank exhausted upon the sofa. Whilst in this state of insensibility she was carried into her bed-room ; the next day an extreme debility followed the paroxysm of raving, during which period I lent her the assistance of a brother. The third day she got better, but had the tormenting recollection of her fit of insanity. I resumed my usual polite behaviour, without taking any notice of her distressed state of mind. This conduct awoke her confidence ; she first began to speak of her disease, and to ask me whether I knew of any remedy ; for surely, said she, you must be well acquainted with these disorders ; I know all you have said and done during my illness ; your advice had saved me many a day of mental derangement. I promised her to do what I could, and proposed to her mother to stop at the next country town, where I resided, and to try an experiment.

My great endeavour was now to find out, if possible, the cause of the sudden attacks of madness. I ascertained that they were not owing to any internal physical cause. It was the voice or the figure of somebody that resembled her gay Lothario, that produced this effect. As soon as she heard a voice which resembled his, or saw a man that bore resemblance to him, she was suddenly attacked with a kind of convulsive fit, that ended in madness. I advised the mother to take a solitary country-house, where the young lady, for six months, should not receive any visitors but female friends. I visited them daily ; and having discovered in my patient a taste for scientific pursuits, I said that, without mathematical instruction, she could never comprehend anything. I worked so much upon her mind that she began to study geometry, trigonometry, algebra, and astronomy. These studies were varied by botanical excursions, and gardening. In less than one year she was perfectly restored. Four years after, I saw her on my journey to England, in full health, married, and in good spirits. With the exception of a few small doses of oxide of zinc, to cure the nervous fits, no other medicines were employed.

THE ALPINE PHILOSOPHER.

TO QUIZZICUS.

" Multa fero, ut placeam genus irritabile Vatum,
Cum scribo." *Hor. 2, Ep. 11, v. 102.*

I can be gentle, like a lamb, to please
The ticklish taste of poets, whilst I write.

may transform the Alpine into an *Alpus*, or even into an *Alp* ; you may laugh as much as you please at my *be* and *t* ; and chaff, and champ, and chatter about the solar and lunar plexus, and the three systems of our organic frame ; I'll laugh with you : but when you alight from your *Pegasus*, and in plain, plump terms, you tell me, in the face of the public, that the mathematical signs which I use to typify the law of bipolarity smell a little of marvellous = quackery, then I must, with all due submission, turn the tables against *Quizzicus*.

What ! can a critic in the nineteenth century accuse a man of quackery, because he endeavours to illustrate a new science with forms and types taken from the only science which, by its self-evidence, has created a language which is universally understood by men of all nations of the globe ? Surely, if I addressed savages, I should fear that + and — might be taken for magic signs ; but in London, where the very *element of life is calculation*, there is none but a poet who would acknowledge himself unacquainted with the touchstone of sound reasoning.

Indeed, if any one be alarmed at those simple mathematical forms censured by the poet, he would be incapable of understanding the very elements of the new doctrine. All my principles, all my arguments, whether logical or physiological, are deductions of the first equation.

But perhaps *Quizzicus* has found out some language more self-evident and universal than the mathematical ; perhaps, (" We've seen strange doings in this age of wonders,") he rejects mathematics altogether, as a futile invention of the learned ignorants of the old world ; and in this case we challenge him to present to the public his important discovery. But I, " who have quaff'd so deeply, may without presumption claim the privilege," until a better language be adopted, to employ the mathematical one, as the least unequivocal one, to explain that science which strives to benefit mankind.—I remain, Sir, yours, *THE ALPINE PHILOSOPHER.*

TO THE ALPINE PHILOSOPHER.

Edinburgh, 23rd April, 1835.

SIR,—The theory of animal magnetism, or tellurism, as you term it, in connection with my other favourite studies, metaphysics and physiology, has exclusively occupied my most zealous attention ever since I had the pleasure of reading, in *Tait's Magazine*, a review of the report on that subject, made by certain commissioners appointed by the Royal Academy of Sciences at Paris, translated by J. C. Colquhoun, Esq., of this city, and of subsequently reading that translation itself, together with the long introduction by Mr. C. ; and the deep interest which I take in the subject has, for various reasons, been of late not a little enhanced by the perusal of your very excellent and philosophic letters in the *Shepherd*.

It is not my intention at present either to treat of your very remarkable theorems regarding time, space, relative and absolute existence, religion, &c., the evident effusions of a mind advanced before the philosophers of the age ; or to allude to my own opinions, physical or metaphysical, modified, as they are, in a very extraordinary manner, by the great modern revelation ; all this I reserve

I AM fond of squibs ; wit is like elastic gas, it escapes through the safety-valve of the poet's lips, and tickles the nostrils of the by-standers. As for your poetical lore, my good *Quizzicus*, I have nothing to say to you. You

to another occasion. Meantime, my object in thus venturing to address you now, is shortly this:—There is a single point connected with the magnetical operation as to which I have failed to obtain the full information I would wish from any of the sources hitherto opened to me; and, as you are an experienced practical magnetiser, I have eagerly embraced the opportunity thus, I hope, afforded me, of satisfying myself on this point, by now requesting that you will so far oblige me, though a stranger to you, as to honour my present letter with an answer, however short, at your earliest convenience.

I have got the fullest information regarding what may be, in the meantime, termed the positive pole of magnetic operation, the method of operating on the patient to the production of the positive magnetic effects, and particularly, I mean, to the production of somnambulism; and I have availed myself of that information theoretically (for I do not intend, and would not attempt, at present, to practise magnetically on any one, although I have given the rules for so doing my best consideration in an explanatory point of view). What I now require is equally full information regarding the negative pole, and particularly the method of restoring the patient from somnambulism, if any such method be necessary.

The telluric or nocturnal life is at present subordinate to the solar or diurnal life; hence, though powerful psychological and physical means be necessary to put a patient into the state of clairvoyance, I think it philosophical to suppose that the natural tendency of the diurnal or solar life to supremacy will be sufficient to restore the balance, or awaken the patient again in a very short time, in a few minutes perhaps, or, at most, in a few hours, without any such psychological or physical means as are necessary to develop or produce the state of clairvoyance; because life has at present far less inclination to lean upon its telluric, than upon its solar term. But I am anxious to know whether I be perfectly right in so thinking; and there are apparently conflicting facts, which leave me quite undecided as to this matter. For instance, in your very interesting letters, you mention that a high somnambulist stated "that she would sleep thirty-three minutes longer." Of course I understand from this that she would, and accordingly did, awake in thirty-three minutes, naturally of her own accord, or without magnetic influences at all. But in the report above alluded to there is a case presented wherein it was thought necessary, to the investigation then going on, that the patient should be kept asleep for several days. He was accordingly somnambulised by the magnetiser, and after the expiry of the time appointed, he was found by the commissioners still asleep since the date when he had been somnambulised in their presence. Now, unless it was by repeated efforts of the magnetiser during the course of that time, and during the absence of the commissioners, that the patient was kept asleep so long, I can only conclude that, in this case, the night life had held the supremacy, almost uninterruptedly, for a number of days, and that a psychical and physical operation would have been as necessary during that time to awaken this patient from somnambulism as it was to the putting him into that state.

The fact, however, that little or no mention is made, either by you or by the French commissioners, of any artificial means of unsomnambulising the patients, leads me to think that the powers of man's constitution are becoming so biased towards day life that positive magnetization in the production of somnambulism, may very properly be compared to throwing a ball up-hill, which is sure to come quickly down again; and that, in

fact, the magnetiser perhaps requires to use as repeated efforts of his will, and, it may be, of manipulation also, to keep (particularly new) somnambulists from coming down again (from awakening) as the thrower of the ball up-hill would, to keep it from instantly returning.

That, during the sleep of the somnambulist, no such means as are used to arouse an ordinary sleeper will suffice to awaken him is evident, because the loudest sounds, the most pungent odours, and the most severe lacerations of the flesh, are insufficient to do so; and therefore, as the magnetisers have evidently the certain power of awakening the somnambulist artificially, and at any moment, there must be magnetic processes, psychological or physical, or both, by which this is accomplished. Pray, what are these processes?

The will and intention of the magnetiser must, of course, be requisite; but there must also be physical processes. In short, I wish to know, amongst other methods, whether manipulation from the extremities upwards (which, I think, you term the negative stroke, and which is counteractive to the production of clairvoyance, and, instead of that state, sometimes causes convulsion, fits, &c., in the waking patient,) be capable of vigilizing the somnambulist, since it seems to be reversely incapable of somnambulizing the vigilant?

Exciting and calming strokes I understand to be upwards and downwards—negative and positive strokes; now it seems to look well in theory to suppose that as the calming (downwards—positive) strokes produce magnetic sleep from vigilance, so the exciting (upwards—negative) strokes produce vigilance from magnetic sleep; but such theory may perhaps widely vary from practice.

If I be correct in all my suppositions, a very few words from you in answer would be sufficient; but, if incorrect, I would highly esteem any few observations, by way of correction, with which you could spare enough of time, at present, to favour me.—I am, Sir, yours, very sincerely and respectfully,
J. D.

P. S. From how many minutes to how many hours do somnambulists sleep after the magnetiser's influence is withdrawn? and is their sleep under such circumstances still somnambulism? or how soon do they generally sink, or rather rise, into ordinary sleep, capable of being cut short by ordinary means, after the magnetiser's influence is withdrawn? Further, do they generally sleep the longer, the deeper the somnambulism is, or the shorter? or is there any observed difference at all?

Shame for using so much liberty with a stranger almost prevents me from adding—Could you tell me, in two or three words, how Pythagoras produced clairvoyance or ecstasy in and by himself, as I cannot otherwise obtain this information easily at present?

The Alpine Philosopher having communicated the above to a friend, it elicited the following questions:

Should not the horizontal position at night be taken into consideration, when the nocturnal side, or pole, is considered?

Is not man's upright position unfavourable to him when he is indisposed?

Do not the fluids circulate better when man is in a horizontal position, than when he is in an upright one?

As it is the centre that regulates the circumference, our business is to see how the patient stands towards it in his will?

The patient's relationship to the centre should be considered as well as the form: the disorder is in the mind. The healing power is in the patient, if the magnetizer

can awaken it; the clapper is in the bell, if the hand can but put it into oscillation; the healing power is more magical than magnetical. The operator is more a magician than a physician.

Why is the telluric side subordinated to the solar side?

For what end does the centre do this?

Ought we not to declare that the centre at all times rules the night form as well as the day form, for it is our purpose?

Does not the centre, in its working the night form as well as the day form, intend a purpose that is beyond the faculties?

Has not the natural centre a divine centre for its model?

Does the magnetizer do any thing more than prepare the patient to be acted on by the centre's centre?

Can the magnetizer's operation be any thing higher than a positive, or removal of obstructions?

Is not the whole work a central work, higher than either the positive or negative?

Are not both positive and negative subordinate to the centre?

Does not the centre act antecedently, and the positive and negative subsequently?

If the somnambulant state be from the centre, will not the recession of the centre be enough to let the awakening state return again?

Is not the somnambulant state a higher state than sleep; and is not sleep a higher or more divine state than the vigilant?

Whatever artificial means that are used to unsomnambulize, must only be preparatory, as the centre must account for all.

The calming or the exciting strokes can only be preparatory, let the appearances seem to be otherwise or not.

Is it not the centre that burns out the evil cause when the magnetizer, by an intense power, inverts the cause into the fiery furnace, or centre?

Are not all cures performed by the centre burning out the cause, when the cause is by a strong will kept long enough at this holy fire?

Does not the magnetizer's will invert the cause, and separate it from the effect, and hold it in an attitude to be burnt up?

Must not the cause be separated from the effect and inverted, before the burning centre can get at it to overcome it?

Does not the central love act as a fire, and, by burning, change all substances into prolific love substances?

The centre brings about a functional action and reaction in the mind, as well as an organic action and reaction in the body.

The centre, when certain faculties are stirred deep enough, brings them into activity, and produces results.

The centre, by the will, as a functionary, operates functionally; and these functional operations are called by various names—hope, fear, pain, pleasure, happiness, misery.

The deeper the magnetizer's will is, the easier it is for him to divorce the cause from the effect, and give it up to be consumed by the central flame—the logos within the soul.

If the cause be not drawn to the central fire to be consumed, it remains in the spiritual constitution, and produces effects in the body.

Is not the positive good of the superior system acted against the negative evil of the inferior system; and the negative good of the inferior system against the positive evil of the superior system?

SINGULAR DREAM.

TO THE EDITOR.

SIR,—As the subject of dreaming is rather a curious one in the philosophy of the human mind, and phrenology is the only system which affords a rational explanation of the nature and origin of dreams, the following narrative may prove not uninteresting to your readers, as an example of considerable activity of some of the intellectual faculties co-existing with the complete inactivity, or sleep, of most of the propensities and sentiments. The whole occurrences were as distinctly impressed on me as if I had been entirely awake.

In the dream referred to, I was standing in St. Paul's Church-yard, when a funeral procession, consisting of a magnificent hearse, drawn by six horses, preceded by a great number of mutes, and followed by an immense train of carriages, slowly approached from Ludgate-hill, and made its way towards the entrance on the north-side of the Cathedral. A dense crowd was looking on, and I was given to understand that the deceased was a man universally known, and distinguished for the services which he had rendered to his country, and the lustre he had shed upon the age in which he lived; but I could not discover his name. On arriving within a short distance of the gate, the procession stopped, and presently Lord Nelson stepped forward from beside me, dressed in his Admiral's uniform, and, with a respectful inclination of his head, as a mark of profound respect for the character of the deceased, stated to him that he had left his own tomb, and come to do him the honours of the funeral vault, and receive him amongst the other great men already buried there. The recently deceased, who, strangely enough, was not in his coffin, but stood near us, received this piece of attention courteously and graciously, and signified how much he was pleased to put himself under his Lordship's guidance in this hitherto untried scene.

After a short pause, Lord Nelson, perceiving the crowd looking eagerly on for the completion of the ceremony, remarked to his guest that he must now take his place in his coffin, and be carried forward in the splendid official hearse prepared for the occasion. His Lordship then ordered the richly-ornamented coffin to be brought forward, and said, that as he was now accustomed to the thing, he would show his friend how to place himself, which he accordingly did by laying himself in it at full length, and carefully pulling a folded covering over his body. He then got out, and the deceased placed himself exactly as directed, on which his Lordship made a signal to lift the coffin into the hearse and move on. This was done accordingly, and we then mingled with the crowd, and proceeded on foot to the door of the Cathedral—I walking familiarly alongside of his Lordship, without ever wondering how I had become acquainted with him, or perceiving anything extraordinary in the fact of a man who had been dead for many years rising from his grave, still dead, and, in the character of a dead man, doing the funeral honours to another dead man. I never for a moment imagined that Nelson was alive; but, on the contrary, was conscious that a long interval had elapsed since his death, and saw distinctly the glazed eye and cold dull features so characteristic of death: and yet so completely were the feelings asleep, that I felt neither wonder, nor awe, nor incongruity, but every thing seemed perfectly natural and as it ought to be; and indeed I was more at ease with him than I probably would have been had I met him in society as a living man.

We entered the church together, and Nelson, with respectful care, was ready to direct every movement, so as to make the situation of his guest as little uncomfortable

as possible. He descended with him into the vault; took his leave; and then adding that he must now resume his place in his own coffin, was going away, but immediately turned round and said, "By the by, as I am here at any rate, would it not be as well to take a look of my head before I go?" I answered eagerly, "that it would, as this was an opportunity which might not occur again, and ought by no means to be lost." We thereupon proceeded to the recess of a window for the sake of a better light; and as he stood before me with his sunk and glazed eye, dull leaden features, and armless sleeve, I thought how very like he was to his portraits, and to the wax-figure in Westminster Abbey! At this time, too, it struck me as extraordinary, that he who had been so long dead should be aware how much interest phrenology was exciting now, when, at the time of his death, it had never been heard of; but this was the only thing approaching to wonder, or perception of incongruity, of which I was conscious during the whole time.

On looking attentively at the forehead, I was struck with the breadth and fullness just above the root of the nose, where Individuality lies; and remarked to him that his power of observing what was passing around him must have been peculiarly acute and rapid, and that I could see many uses in his profession to which it was applicable, although I had never before thought it was so necessary. He requested to know exactly what was comprehended under the term Individuality; and after listening to the explanation, replied, "*It is quite true: I must have it large—that was my forte—I was always quick in observing.*" I then noticed the great development of Locality, Weight, Size, and Form, told him the qualities of mind which they indicated, and remarked on the fondness for exploring other countries, which such a combination bestowed, and the facility which it gave of recollecting places and countries once seen. He said this also was correct, and that he found Locality useful even in stationing the ships of his fleet. I proceeded in my examination, and remarked that I was disappointed to find the upper part of his forehead more retreating than I had anticipated—denoting less power of logical reasoning and systematising than I had conceived him to possess. He begged I would explain particularly the functions of that part of the brain; and when I gave him the usual account of Causality, he thought for a moment, and replied, "*Well, after all, you are perhaps not far wrong there either: I was not remarkable for reasoning power; observation and the other qualities were what I excelled in.*" My interest in the examination was becoming every moment more intense, and my eye was taking the direction of Firmness, an organ which seemed to be very largely developed, when, unfortunately, the vault-keeper came quietly up, and, tapping his Lordship on the shoulder, said all was ready for him down below, and he would thank him to resume his place, as he had not time to wait longer. His Lordship at once obeyed, and bade me good-by, with a slight bow, but without altering a single feature of his face. I then left the church, thinking how fortunate I had been to be there at such an interesting time, and soon after awoke.

Such are the facts of my dream. I shall not attempt to explain them, further than by remarking, that they exhibit a striking instance of activity of some faculties co-existing with repose of others; a circumstance which can be accounted for only by the phrenological principle of a plurality of cerebral organs, each of which may be active while the others are at rest. The perfect recollection which I had, not only of Nelson's history, appearance, and death, and of the localities of St. Paul's and

the aspect of its monuments, but also of the phrenological doctrines and their application in life, formed a singular contrast to the total absence of every feeling of awe, incongruity, wonder, or disgust, which, in the waking state, would have been so strongly excited. The only cause to which I can ascribe the dream, is having previously resolved to send to the library for Southey's Life of Nelson, which I had heard praised as an excellent piece of biography.—*Phrenological Journal.*

THE DOCTRINE OF THE "WOMAN."

NO. VIII.

MAN representing the physical, and woman the moral, it is easy to understand why woman has been subjected to man in the first stages of human progress, and also how she necessarily gains additional importance only in proportion as the "moral" of humanity is developed. But many are still of opinion that, when we designate the male by the epithet "positive," and apply the corresponding opposite term "negative" to the female, we convey the idea of general inferiority, or even of insignificance, in respect to the latter. This is a false notion, arising from an unphilosophical preference, for which there is no authority, or even analogy in science. The two extremes of Nature are equal, and both are positive and negative to each other. The male is "*positive*" in respect to physical strength and intellectual strength; but the female is positive in respect to physical beauty, and moral and intellectual delicacy and refinement. These latter are accomplishments, the value of which will be more and more appreciated by mankind. The end and aim of all education is to improve the looks, refine and polish the manners of society. We know from experience and observation that it has that effect. The features of the well-educated and influential class of the community are always, upon an average, more handsome than those who have not enjoyed the benefits of intellectual polish. There is a dignity, an ease, a repose and chastity of look, about a man who has mixed with good society, which the man of humble life can only assume by reading and reflection. There are a propriety of speech, an affability of manner; in fine, a whole host of social virtues, which if they cannot be implanted by mere knowledge, are at least developed in a more vivid and fascinating manner. These form the "*moral*" of education, and the source of all social and domestic happiness; yet these, which are of the highest value, and indispensable ingredients in the composition of the *beau ideal* of socialism, we denominate "negative" in the present or old system of society. How then can we be said to do disparagement to the character of woman, when we rank her in the same catalogue with the highest order of virtues? If she complain of this, she only complains that she has been endowed by Nature with the sentimental and moral, and not the physical, strength of constitution.

Moreover, it has been asked, if woman represent the moral, and the moral be destined to govern the world, must it follow that the political authority shall ultimately fall into the hands of woman? *Never.* Woman will never rule politically; for politics, to the very end of time, are the physical department, which does not belong to woman. Moreover the moral government is not a vi-

sible, but invisible government; it has no magistrates, lawyers, courts, or executioners. It has nothing but opinion, looks, words, and thoughts, as its administrators. These are gaining ground so fast upon the political law in these latter days, that the greater proportion of the public are governed by them alone, living in almost utter ignorance of the laws of the land in which they reside.

Then it may be replied, "Woman gains no additional authority by this moral advancement of which you speak." If you mean by authority, a right to imprison, to levy armies, and dictate to constables and police officers, we reply, *None*; but if you mean by authority, moral influence over the public and private conduct of men, we answer, *Much*: it increases daily; but man will to all eternity hold the political sceptre. Notwithstanding it is still true what a prophet has said, that the world can never be redeemed until the sceptre be put into the hands of "*Woman*;" but the *moral*, not the *political* sceptre, is meant.

And how can this be done? No act of legislature can do it, we are certain. It must be done by the consensual improvement which will gradually take place in the moral and intellectual education of both men and women, assisted by such acts of the legislature as shall keep pace with the progress of mind, and encourage the development of the new public character; such as the repeal of all those laws which control by physical punishments the expression of opinion upon political and religious subjects, leaving every man to the mercy of the moral sense of the public, which will always be sufficiently strong to preserve the equilibrium that is necessary for rational enquiry. The abrogation of all such laws we would call the commencement of a moral system; or, in the words of mysticism and inspiration, the reign of the woman; the development of whose moral character being greater than that of man, would always exercise greater influence over moral doctrines, and thus, in a more positive and active sense than he, guide the reins of public morality. This female authority must always increase in the same proportion as woman reads and thinks, and her education is calculated to foster the development of her reasoning faculties; for the reasoning faculties invariably refine the moral. Now woman, being more moralized by Nature than man, would infinitely surpass him if her reasoning faculties were equally developed. The moral will come of itself. Let her mind be well-informed, and trained to useful and serious thinking, and the beneficial effects of this will be felt like a refreshing breeze over the whole surface of the moral world.

CORRESPONDENTS.

We have received Mr. Parker's letter, which we have carefully read, although it contains nothing which we have not heard a hundred times over. We cannot help his blindness, neither shall we pray to the Lord to remove it; for the Lord has his own reasons for keeping him in darkness, and we do not wish to interfere with his plans of providence. But if Mr. Parker chooses to come to our Lecture on Sunday evening, and state his objections verbally, we shall be happy to see him, and he may have

free admission by giving his name. The passages which he quotes to prove that God and the Devil are not one, only confound himself. It is needless for us to multiply proofs of this self-evident truth, the ignorance of which has desolated the world with savage bigotry so long. We need only refer to the undeniable fact, that the Scriptures say that God hardens the heart and shuts the eyes, and that the Devil does the same. Turn it and twist it as you like, and puzzle yourselves and others by scholastic terms, and logical (rather illogical) distinctions, still the gloomy fact is before you, with which even a child would overturn all your fabric of sophistry. Mr. Parker accepts our challenge to point out a lie that ever the Devil told, and alludes to what he said to Eve when tempting her to eat the fruit—"Thou shalt not surely die," says the Devil. "Was not this a lie?" says Mr. Parker. We allow him to answer "yes" or "no" for us; we care not which. If he says "yes," then Jesus Christ must be a liar also; for we are told (Mark v. 39.) that when he was about to raise a dead woman, he said to those who were weeping around her, "Why make ye this ado, and weep? the maid is not dead, but sleepeth." This is a case exactly analogous to that of the Devil in the garden. The Devil said, ye shall not die (ye shall only sleep). Christ said, she is not dead, she only sleeps. If she was not dead, why boast of raising her to life? Nor is this mystical lie of the Devil's a whit more fallacious than the words of God—"In the day thou eatest thou shalt die;" which day our Correspondent would say means a thousand years; but although he suffers God to say one thing and mean another, as he did to all the prophets and prophetesses, as well as to Joanna Southcott, his liberality won't permit this liberty to his Satanic Majesty. Most righteous judge! truly, God ought to be ashamed of his own pretended friends, for they blaspheme his name sadly by their awkward attempts to defend it!

We are quite surprised and puzzled at the letter of a lady this week. She must have sadly misunderstood our meaning, or we misunderstand hers. We hope, however, she will recall her words, and not vex herself with trifles.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 18th inst., at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

Tuesday, 19th instant, at 8 o'clock in the evening, at the lecture of the Society for the Acquisition of Knowledge, 36, Castle-street, Oxford-market, a gentleman from the country will treat upon the subject of Marriage—what it is. Admittance for Visitors, 3d. Ladies free.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Tron-gate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Bready, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 39.]

SATURDAY, MAY 23, 1835.

[Price 1d.]

SYSTEM OF NATURE.

A System of Nature is only another name for religion. Every religion professes to be a system of Nature. An infidel or an atheist cannot write a system of Nature, for the "in" and the "a" at the beginning of the words are pure negatives, which imply "no system;" so that any attempt to produce a system of mechanical action in the movements of the universe would be at the same time an attempt to falsify his own title. If he succeed in making a system, he is neither atheist nor infidel; and if he don't succeed, he has written no system.

Religion must be perfected some way or another. Not the religion of morals only; that is not sufficient, and quite incapable of being organised without the religion of opinion also. You may just as well try to make a statue of loose sand, as a religion, or system of morals, or social system, without a satisfactory view of the system of Providence in relation to the education, and discipline, and destiny of mankind.

Nay, although the morals are the most important, in respect to their immediate effects, inasmuch as it is by good or bad morals alone that social happiness or misery are produced; they are the least important as primary agents, inasmuch as they themselves are the result of faith or opinion, either liberal or illiberal, kind or cruel, in proportion to the expansion or contraction of the mind, in its views of universal Nature.

Faith, or opinion, is the primary moving principle; and it must be satisfied as to the plans of Providence, or mankind will remain as they are. If a man proposes to re-organise the system of society, without having a twofold system of religion, faith and morals, in his own mind, he proposes to do a work for which he is unqualified. He can only give satisfaction to those who have taken partial views of Nature, like himself; but never to the universalizing mind. I ask such a man what particular object Nature had in view in raising up the Jewish church, committing such a curious revelation to paper; giving it such an ascendancy over the human mind; giving it also a progressive character, so as to meet and embrace every new discovery of science, and accommodate itself to the progress of humanity, at the same time anticipating still greater perfection as its own destiny, and the destiny of man, whom it accompanies to eternity? "I know nothing about such things," he replies; "we have nothing to do with such old stories; we must study Nature, and leave those nursery-tales of tradition and mysticism." "Then we must leave you," is our reply; "you profess to teach a system of Nature, and are igno-

rant of the very elements of the science of progress." Were a man to deliver a lecture on anatomy, and a hearer were to ask him, "What is the use of making the infant's bones so soft and tender, and his brain so liable to injury?" and the *learned* professor were to reply, "Oh, don't trouble yourselves with such vagaries; these are mere imaginations, that will lead you astray; look at the bones, and the bones only; never think of uses, and imagine nothing that you don't see." "Then," we reply, "we have nothing to do with you; for seeing and hearing are of no use to us, except as providing food for imagination. Imagination is the soul, the life of man. The brute can see the bone, and hear the lecture, as well as we, perhaps better; but it wants imagination to play with the material, and create a new world of idealism within the mind. We want not materialities, but spiritualities; they alone are the true patents of nobility; and we only seek the former because they provide material for fabricating the latter. If, therefore, you cannot feed our imagination, we shall seek another teacher: we shall prefer the old world with imagination, to the new without it."

Well, but suppose our supposed teacher were to say, in reply to our first question, "Oh, those old religions are merely the ravings of ignorant and enthusiastic minds, and owed their success exclusively to accidental circumstances, co-operating with superstitious fears and delusions." "Accidental circumstances!" we reply; "we thought you taught a system of Nature; and now you talk of a long succession of Nature's progress being under the operation of *accidental* circumstances, without a system. This won't do for us; if you cannot give us a better answer, we must look for information somewhere else." It a poor way of teaching anatomy, to say, "Here is a bone, gentlemen—a very crooked-looking thing, full of knots and holes, and hollow within; but I don't know the use of it. It certainly ought to have been quite straight, smooth, and solid." This man never studied the nerves and muscles; and as for the marrow, he thought it a defect in the system; his great object is to give solidity and beauty to the bones.

Suppose our teacher moves one step farther, and says, "I believe it was absolutely necessary, in the infancy of society, that such delusions should be practised upon the human mind, as a substitute for that sound and useful instruction which can only be the result of long and painful experience." This is somewhat more satisfactory, and our teacher now *begins* to be rational. But he only *begins*; there is something more to be known respecting this necessity. If it was necessary, then it was right; and if it was right, it was useful, leading to good results

at the time, and laying a foundation for better results in future, as the root of a new and better system. If he says "Yes" to this; then, we reply, the old and the new are both one great system of progression; the one containing the embryo or seed of the other, to be ripened when the mind is prepared by knowledge to develop it. If so, then the study of the old and new world are one study, even as the study of roots, branches, and leaves is all included under botany. Consequently, no doctrine for universal society can give satisfaction, which does not arrange the whole plan of Providence in systematic order. This is neither infidelity nor atheism. If he says "No," we leave him to his own confusion. In fine, it is as clear as day-light, that every man who teaches a universal doctrine must proceed in the manner pointed out by us, or he loses himself in a labyrinth of his own digging.

Moreover, it is needless to annoy us with such articles of faith as these—"Man is man is made by a power unknown," or, "The universe is governed by a power unknown;" for we know more about this power than about anything else. If I ask the man who talks so, "By what power is a steam-engine moved?" he probably answers, "By steam." Is this a satisfactory answer? Not to me, for I want to know what power it is that makes steam elastic. This he does not know; consequently he does not know by what power a steam-engine moves. And the same may be said of a watch, or any other machine. In fine, if he knows not God, he knows nothing; for God is Power. It is mere trifling, then, to substitute Power for God, and shows an imperfection of doctrine, which is not universal or accommodating enough to embrace the popular language of the age and country in which we live; and is any man great enough to make a new language? But the principal objection against this word God, is the *life* that is in it. They want a *dead* power to rule the universe; and if so, it is very wisely and very appropriately called an "unknown power," for we defy any rational or irrational animal to conceive such a thing; it is the last resource of a desperate cause, even to use such an expression. Power is *will*, and we have no experience of any other power; all experience is *within*; observation is *without*. These are two very different things. We observe movements in outward nature, without observing the will that moves them, for will is not observable; but we experience the will that moves our own members, and that is the only power of which we have experience. Consequently experience makes us acquainted with no power but *will*; and will is not dead, but *living*. "And so," says experience, "is the will of the universe, and that is God." Twist and torture your words and ideas as you may, we shall always bring you to this, which is a demonstrative fact; a *positive*, and not a *negative* like the unknown system.

And when we have got all this, what have we got but "FAITH;" faith in God, faith in a plan of Providence, faith in Judaism, as a part of that plan; faith in Christianity, as another part; faith in Mahometanism, &c.; as other portions; and faith also in the progressive development of that plan to the human mind, as it advances from the infinite divisions and discords of Individualism to the unity and concord of Universalism. Make a sys-

tem without this faith, if you can; and with it all partial faith and infidelity become the most absurd and contemptible peurileties, destitute of the very elementary principles of rationality.

Yet this "faith" may be called no faith, inasmuch as it is not faith, but knowledge, reason, and analogy. Hence we have on former occasions spoken of the necessity of destroying faith; that is, mere faith without knowledge. This double style of speech is in perfect accordance with our doctrine, and is intelligible enough to those who are acquainted [with its principles; who not only understand it, but see the necessity and the beauty of it, as tending, when generally employed, to acuminate the judgment, and establish in the mind the indispensable, all-important idea of the double character of Nature, without which, as a compass to guide us, we never can arrive to any definite conclusion upon any moral or metaphysical question. The contradiction is only apparent; for the one sense is partial, the other universal. Partial faith, partial benevolence, &c., are evil. Universal faith, universal benevolence, are good. The two are opposite extremes; the one, the leading spirit of the old world; the other, of the world to come. When, therefore, we have in other writings spoken of faith disrespectfully, and in the *Shepherd* of faith respectfully; in the one we meant "partial faith," in the other, "faith universal."

Faith is the positive or active principle, like life. Infidelity, atheism, and all similar chaotic systems, if systems they may be called, are purely negative and inactive. We therefore consider it indispensable to build upon a foundation of faith and of universal life, because we find it impossible to reason conclusively from any other premises.

Consequently, we are not infidels: we are full of faith, and hope, and charity; and yet we are infidels, inasmuch as we reject and despise the doctrines of old Christianity, as taught and enforced by the priests. We abhor all partial and unjust systems, all prepossessions, prejudices, and preferences in favour of individuals; consequently, we dislike the exclusive articles of old Christianity, which make God a respecter of men's persons, in bestowing the gifts of grace and salvation upon some, whilst he showers down the fire of his wrath upon others.

We divide the old religion of the world into two separate departments; namely, hope and fear. We encourage the former to the utmost longitude and latitude of which it is susceptible. The latter we destroy; so that by this carving system we become both believer and infidel in one; believer, in respect to all the hopes and consolations of religion; infidel, in respect to its fears and horrors. But we do not adopt this carving system merely because we would have it so, and prefer it to any other; but because it has the greatest amount of argument in its favour, both from reason and revelation, which combine to demonstrate its truth.

We thus put a check upon the prevailing spirit of both extremes; upon faith, which goes to make God a monster, by his partiality and injustice; upon infidelity, which either denies the life of God, or his individual providence and merciful intentions respecting human beings. We have no intercourse with either. They are both of them gloomy and horrific systems, degrading to God, and

repulsive to human nature; systems from which man has always shrunk, and ever will shrink, as long as he has a mind to discriminate between pleasure and pain. The one is horrific by its *positive* infliction of personal suffering in the inquisition of Hell; the other is horrific in its *negative* deprivation of all personal pleasure in individual annihilation. The two comprehend the sum total of horror, beyond which the human imagination can never trespass. We leave them to their own merits, to make their own way in the world of opinion, by no means apprehensive that either one or the other will meet with eminent success. The one will captivate the gloomy, the exclusive, and the superstitious; the other, the hopeless, cheerless suicides, whose only immortality consists of being converted after death into worms or maggots, and prolonging their existence in the shape of vermin. The former may collect a party by means of its hopes and fears, which form a powerful uniting principle; the latter can never collect a party, for it is the emblem and personification of death, which disorganizes and scatters the elements which life collects.

Nor is it mere nominal, or what has been called philosophical faith, alone, that we build upon. It is a faith as strong, as active, as consoling, as any religious faith in the history of man; a faith which dwells with repose and certainty upon all the promises of religion; a faith which trusts in Providence, both individual and universal; which looks forward with enthusiasm to the fulfilment of the hopes which the faithful in all ages have entertained; and a faith which is combined with the utmost degree of liberality and charity; liberality and charity so great, that if any opposite doctrine will show more, we shall abandon our own immediately in favour of the other. What then is it that our doctrine wants? Is it the hopes and consolations of religion? It has them all in perfection. Is it liberality and charity? It exceeds all other doctrines in these two virtues. Is it scientific demonstration, and analogy of Nature? These are its peculiar characteristics, in which it is unrivalled. Is it the evidence of revelation? It is built upon revelation, as one of its two pillars. In fine, it has every support which any other doctrine has; and, more than this, it has all the supports which were ever employed, or ever can be employed, in the maintenance of any system of faith or opinion.

THE SHEPHERD.

UTILITARIAN DOCTRINE.—THE LONDON REVIEW.

TO THE EDITOR OF THE SHEPHERD.

SIR,—The Utilitarian doctrine of morals has received a fresh accession of logical support in the new periodical called the *London Review*, which advocates rapid and thorough changes in our political institutions. As this doctrine is relied upon by many men of activity and influence, and will probably, therefore, as far as doctrine can, influence many forthcoming reforms, I suggest that it is not beyond the sphere of your philosophical crook, gentle Shepherd, to investigate this doctrine, and indulge your readers with your view of the matter.

You are no doubt aware, that the late Mr. Bentham

was the great promoter of the doctrine; that although obscurely seen by D. Hume, Locke, Paley, and others, he was the mind that brought it to maturity, that is, if it be yet matured.

The proposition is, if I understand it correctly, that the reason and experience of man will inform him that he *should* do what is right; and also that those actions are morally right which conduce to the greatest happiness of his fellow-creatures. This of course denies the existence of a moral sense in man, because it attains the end without it. The main objections to the doctrine are, that no human intelligence can foresee the results, or calculate the possible results or tendencies of his actions; and that if he could, it is a sort of backward logic which estimates the value of my present actions upon myself by what may be their results hereafter upon others; which takes all moral power off the internal and individual life of man, and puts it on the external and social; which says the nature of the stream must be determined by the end, the place into which it flows, not by the source whence it flows.

I have sometimes thought that, as upon many other occasions, there is no essential difference between doctrines that seem so opposed in words, as that of an internal, eternal, moral power in man, and this of an external, temporal result, amenable to the reason. They are, perhaps, only two opposite views of the same thing; one spectator looking up the stream, the other down the stream. Man may have a moral sense, which has its outward reflection in the universal good of mankind, though it does not and cannot wait for that reflection before it decides whether to act or not to act; if it did, the reflection would never exist. The spirit of universal love may be the instinct, the impulsion; universal good may be the end.

Thinking the subject worthy your attention, I submit this crude notice, and remain respectfully,
April 27, 1835. ONE OF THE FLOCK.

ON MENTAL DISEASES.

LETTER VIII.

Breathes there the man, with soul so dead,
Who never to himself hath said,

"This is my own, my native land!"
Whose heart has ne'er within him burn'd,
As home his footsteps he hath turn'd,
From wandering on a foreign strand?

If such there breathe, go, mark him well;
For him no minstrel raptures swell;
High though his titles, proud his name,
Boundless his wealth, as wish can claim;
Despite these titles, power, and pelf,
The wretch, concentred all in self,
Living shall forfeit fair renown,
And, doubly dying, shall go down
To the vile dust from whence he sprung,
Unwept, unhonour'd, and unsung.—WALTER SCOTT.

It is natural to every being to feel a certain magnetical attraction towards the spot where it received the first spark of life. The gardener may nurse with all his care the plant that first pushed its roots in a foreign climate; it languishes, and consumes itself with a secret longing

after the congenial air of its birth-place. So the animal, and likewise man; yet man, being possessed of a more ductile nature; indeed, he being the only creature who can, as it were, destroy his natural nature, and assume an artificial one; man can, generally speaking, extinguish this his primitive affection. And what can man not destroy within himself? love, peace, conscience, sympathy—every thing, even the very notion of his belonging to the family of mankind.

This rule, however, finds its exceptions. There are human beings in whom the love of their native land is so implanted within their hearts, that no power on earth is capable of destroying it; yet, wonderful is it to say, that this love is not always in proportion to the richness or beauty of the spot in which one is born, but chiefly to the more or less corrupted nature of the individual. Is it not the same in all deeper affections; does not the intensity depend rather on the sensibility of the individual, than on the value of the object?

The inhabitants of mountainous countries, and those of the polar regions, are more attached to their native land than the inhabitants of the south of France, or of Italy. This love of the native land produces often a mental disease which ends in suicide, or other forms of melancholy and mania. The first attack of this disorder manifests itself with loss of appetite, palpitation of the heart, and want of rest. The eye becomes wild or wandering; the heart longs day and night after the native land. If this wish be not satisfied; if a general prostration of the vital powers, a kind of consuming fever, does not abate the violence of the desire, temporal insanity drives the foreigner to commit suicide; or, if this be not the case, his mind becomes strangely deranged.

The first two or three years that I was in this country I had twice a year an attack of this disorder,—in the spring and in the autumn. When I saw a tree in full blossom, or when the first autumnal breeze summoned the migratory birds to their journey, I always was seized with a sudden melancholy. It was as if a distant magnet was acting upon my nerves. I would have put myself immediately on the road; and because a thousand dangers and difficulties were against my wishes, I was combating daily against my conscience and against my principles; and it was but through the accident of a friend of mine that committed suicide, that I myself was cured from this disorder. Then my poor reason was truly in jeopardy.

This, my friend, was a German—a young man of good education, and the most noble-hearted creature in the world. His parents were of the Jewish persuasion; he himself was strongly addicted to scepticism. His moral conduct was exemplary; benevolent towards every one; brotherly; attached to his friends; cheerful in his conversation, diligent in his studies, faithful to his promises, industrious in his habits, G. C— had gained the friendship of many worthy gentlemen.

At once the desire of returning to Germany came upon him like a thief in the night, though but a day before he had laughed at my patriotic sentimentality, and declared that no power on earth could induce him to leave England until he became possessed of some property which

he expected from some of his relations. He concealed from me the real cause of this sudden attack of melancholy, but complained of loss of appetite and costiveness, for which I prescribed a gentle purgative. In three days the disease had reached its acmé. On the morning of the third day he asked me whether he should take some opium? I refused it, and cautioned him against taking any. I knew that I had in the adjoining room, to which he had free access, two ounces of opium in powder. In the afternoon, on returning home, C— said to me, in a serious tone, "I have doctored myself—I have taken opium." "You have done wrong," was my reply. "I have done right," rejoined he; "for I shall thus get rid of this accursed foggy London;" and he showed me the phial of opium half empty, and gave me several letters, with injunctions to forward them to his friends as soon as he was dead. All that human sympathy could suggest to save him, was done; but he obstinately persisted in refusing all assistance, and indeed threatened to murder me if I should attempt to counteract the poison.

Notwithstanding his threats, I attempted to have the stomach-pump applied by main force. Even this attempt was frustrated by his pertinacity. He died a victim of insanity, produced by the love of his native land.

This scene left such a powerful impression upon my mind, that I was effectually cured of the same disease.

In similar cases, however, it is difficult to find out a proper mental treatment for the diseased, because the disease is concealed under a milder form.
